Comprehensive medical reference and review for the
Medical Council of Canada Qualifying Exam Part I and the
United States Medical Licensing Exam Step 2

32nd Edition

Editors-in-Chief:
Zamir Merali and Jason D. Woodfine

Wherever the art of medicine is loved,
there is also a love of humanity.

– Hippocrates

Dedicated to all
past and present contributors
and
supporters of Toronto Notes
who have made the production of the 2016 edition possible!

The Toronto Notes is dedicated to helping fund many charitable endeavours and medical student initiatives at the University of Toronto's Faculty of Medicine. Programs that have received Toronto Notes funding include:

**Community Affairs Projects**
- Saturday Program for Inner City High School
  and Grade 8 students
- St. Felix Mentorship Program for Inner City children
- Parkdale Mentorship Program for Grade 10-12 students
- WoodGreen Community Centre
- Let’s Talk Science
- Growing Up Healthy

**Medical School Clubs**
- Books with Wings
- Women in Medicine
- University of Toronto International Health Program
- Complementary and Alternative Medicine
- Peer Support for Students
- History of Medicine Society
- Faculty of Medicine Yearbook

**Annual Faculty Showcase Events**
- Bruce Tovee Lecture Series
- Daffydlil, in support of the Canadian Cancer Society
- Earthtones Benefit Concert
- Convocation and Ceremonies

**Scholarships and Bursaries**
- Nishant Fozdar Memorial Award
- Graduating Medical Class Scholarships and Bursaries

**Note:**
Many of you have wondered about the Toronto Notes logo, which is based on the rod of Asclepius, the Greek god of medicine. The rod of Asclepius consists of a single serpent entwined around a staff. This icon symbolizes both rebirth, by way of a snake shedding its skin, and also authority, by way of the staff.

In ancient Greek mythology, Asclepius was the son of Apollo and a skilled practitioner of medicine who learned the medical arts from the centaur Chiron. Asclepius’ healing abilities were so great that he was said to be able to bring back people from the dead. These powers displeased the gods, who punished Asclepius by placing him in the sky as the constellation Orphiuchus.

The rod of Asclepius is at times confused with the caduceus, or wand, of Hermes, a staff entwined with two serpents and often depicted with wings. The caduceus is often used as a symbol of medicine or medical professionals, but there is little historical basis for this symbolism.

As you may have guessed, our logo uses the rod of Asclepius that is modified to also resemble the CN Tower – our way of recognizing the university and community in which we have been privileged to learn the art and science of medicine.

Thomas O’Brien, MD
Class of 2009
M.D. Program, University of Toronto
Dear Readers,

As the Editors-in-Chief of Toronto Notes 2016 we are proud to present this updated edition.

Toronto Notes began humbly in 1985 from a set of student notes circulated among medical students at the University of Toronto. Over time, Toronto Notes has grown into one of the premier study resources for generations of Canadian medical school graduates. This rich history has led to our firm commitment to publish a comprehensive study resource for medical students engaged in clinical rotations and studying for both the USMLE Step 2 and Canadian MCCQE Part 1.

For over 30 years we have remained committed to our original vision. The 2016 edition of Toronto Notes contains significant improvements including:

1. A new emphasis on ‘Approaches to Common Clinical Presentations’ in addition to traditional content organized by disease.
2. A completely revised Psychiatry chapter incorporating the DSM-V in a quick-to-reference and readable format.
3. The Toronto Notes Quiz App, which is available for free on iTunes and Google Play. This app contains hundreds of questions allowing users to test themselves on the content contained within Toronto Notes.
4. A significantly improved interactive eBook with many new high-quality colour images.
5. A brand-new Clinical Handbook that is more concise, has numerous new figures, and features approaches to hundreds of common clinical situations.

Toronto Notes 2016 is produced by Toronto Notes for Medical Students Inc., which is a non-for-profit organization supporting various charity organizations in the city of Toronto. This year Toronto Notes for Medical Students has supported organizations including medical school clubs, community outreach groups, student bursaries and scholarships, and the Canadian Cancer Society. Your purchase of Toronto Notes 2016 is much appreciated by these well-deserving groups.

We would like to highlight the exceptional work of our team, composed of over 150 medical students, medical illustrators/artists, and faculty members at the University of Toronto Faculty of Medicine. Without the tireless effort expended by these individuals the production of Toronto Notes 2016 would not have been possible. In particular, we would like to highlight the work of the executive team, all of whom made personal sacrifices in balancing clinical work with the responsibilities asked of them. We also want to highlight the work of Jesse Lu and Kota Talla, without whom the production of the Toronto Notes Quiz App would not have been possible. Lastly, we would like to thank our partners at Type & Graphics Inc., particularly Enrica Aguilera, for their guidance during the production of Toronto Notes 2016.

We hope you find Toronto Notes 2016 enhances your medical knowledge and allows you to perform better on both your clinical rotations and licencing exams. We continue to encourage feedback – this year, we have read and incorporated every piece of feedback we received about the previous edition of Toronto Notes. On behalf of the Toronto Notes 2016 team, we wish you success in your studies.

Sincerely,

Zamir Merali, BSc. and Jason D. Woodfine, BSc.
Editors-in-Chief, Toronto Notes 2016
MD Program, University of Toronto
We would like to acknowledge the exceptional work of all previous Toronto Notes (formerly MCCQE Notes) Editors-in-Chief and their editorial teams. The 32nd edition of this text was made possible with their contributions.

How to Use This Book

This book has been designed to remain as one book or to be taken apart into smaller booklets. Identify the beginning and end of a particular section, then carefully bend the pages along the perforated line next to the spine of the book. Then tear the pages out along the perforation.

The layout of Toronto Notes allows easy identification of important information. These items are indicated by icons interspersed throughout the text:

<table>
<thead>
<tr>
<th>Icon</th>
<th>Icon Name</th>
<th>Significance</th>
</tr>
</thead>
<tbody>
<tr>
<td>✅</td>
<td>Key Objectives</td>
<td>This icon is found next to headings in the text. It identifies key objectives and conditions as determined by the Medical Council of Canada or the National Board of Medical Examiners in the USA. If it appears beside a dark title bar, all subsequent subheadings should be considered key topics.</td>
</tr>
<tr>
<td>🔮</td>
<td>Clinical Pearl</td>
<td>This icon is found in sidebars of the text. It identifies concise, important information which will aid in the diagnosis or management of conditions discussed in the accompanying text.</td>
</tr>

Chapter Divisions

To aid in studying and finding relevant material quickly, each chapter is organized in the following general framework:

**Basic Anatomy/Physiology Review**
- features the high-yield, salient background information students are often assumed to have remembered from their early medical school education

**Common Differential Diagnoses**
- aims to outline a clinically useful framework to tackle the common presentations and problems faced in the area of expertise

**Diagnoses**
- the bulk of the book
- etiology, epidemiology, pathophysiology, clinical features, investigations, management, complications, and prognosis

**Common Medications**
- a quick reference section for review of medications commonly prescribed
# Common Unit Conversions

To convert from the conventional unit to the SI unit, **multiply** by conversion factor
To convert from the SI unit to the conventional unit, **divide** by conversion factor

Further information on these topics can be found in the Objectives of the Considerations of the Legal, Ethical and Organizational Aspects of the Practice of Medicine (CLEO) – which can be downloaded free of charge from the Medical Council of Canada website at http://mcc.ca/wp-content/uploads/CLEO.pdf

Canadian law applicable to medical practice varies between jurisdictions and changes over time. Criminal law is nationwide, but non-criminal (civil) law varies between provinces. This section is meant to serve only as a guide. Students and physicians should ensure that their practices conform to local and current laws.

The Canadian Health Care System

Overview of Canadian Health Care System

- one federal, three territorial, and ten provincial systems
- major complexities involved in establishment of Canadian health policy include geographical diversity, socioeconomic divisions, and international pressures
- financed by both the public (70%) and private (30%) sectors
- each provincial plan must cover all medically necessary health services delivered in hospitals and by physicians; may choose to cover services such as home care and prescription drugs
- non-insured health services and fees are either covered by private insurance or by the individual
- workers' compensation funds cover treatment for work-related injuries and diseases

Legal Foundation

- the legal foundation of the Canadian health system is based on two constitutional documents:
  1. Constitution Act (1867): deals primarily with the jurisdictional power between federal and provincial governments
  2. The Canadian Charter of Rights and Freedoms (1982): does not guarantee a right to health care but, given government’s decision to finance health care, they are constitutionally obliged to do so consistently with the rights and freedoms outlined in the Charter (including the right to equality, physicians’ mobility rights, etc.)

- and two statutes:
  1. Canada Health Act (1984): outlines the national terms and conditions that provincial health systems must meet in order to receive federal transfer payments
  2. Canada Health and Social Transfer Act (1996): federal government gives provinces a single grant for health care, social programs, and post-secondary education; division of resources at provinces’ discretion

History of the Canadian Health Care System

1867  British North America Act (now Constitution Act) establishes Canada as a confederacy
- “establishment, maintenance, and management of hospitals” under provincial jurisdiction

1965  Royal Commission on Health Services (Hall Commission) recommends federal leadership and financial support with provincial government operation

1984  Canada Health Act passed by federal government
- replaces Medical Care Act (1966) and Hospital Insurance and Diagnostic Services Act (1957)
- provides federal funds to provinces with universal hospital insurance
- maintains federal government contribution at 50% on average, with poorer provinces receiving more funds
- medical insurance must be ‘comprehensive, portable, universal, and publicly administered’
- bans extra-billing by new fifth criterion: accessibility
1996 *Canada Health and Social Transfer Act* passed by federal government
- federal government gives provinces a single grant for health care, social programs, and
  post-secondary education; division of resources at provinces' discretion

2001 *Kirby and Romanow Commissions* appointed
  *Kirby Commission* (final report, October 2002)
- examines history of health care system in Canada, pressures and constraints of current
  health care system, role of federal government, and health care systems in foreign
  jurisdictions
  *Romanow Commission* (final report, November 2002)
- dialogue with Canadians on the future of Canada's public health care system

2004 *First Ministers' Meeting on the Future of Health Care* produces a 10 year plan
- priorities include reductions in waiting times, development of a national pharmacare
  plan, and primary care reform

2005 *Chaoulli v. Quebec*, Supreme Court of Canada decision
- rules that Quebec's banning of private insurance is unconstitutional under the
  Quebec Charter of Rights, given that patients do not have access to those services under
  the public system in a timely way

2004 *First Ministers' Meeting on the Future of Health Care* produces a 10 year plan
- priorities include reductions in waiting times, development of a national pharmacare
  plan, and primary care reform

2005 *Chaoulli v. Quebec*, Supreme Court of Canada decision
- rules that Quebec's banning of private insurance is unconstitutional under the
  Quebec Charter of Rights, given that patients do not have access to those services under
  the public system in a timely way

2011 First progress report by the Health Council reviews progress (2004 First Ministers'
10 year plan)
- significant reductions in wait times for specific areas (such as cancer, joint replacement
  and sight restoration), but may have inadvertently caused increases in wait times of
  other services
- despite large investments into EMRs, Canada continues to have very low uptake,
  ranking last in the Commonwealth Fund International Health Policy survey, with only
  37% use among primary care physicians
- little progress in creating a national strategy for equitable access to pharmaceuticals;
  however, there has been some success in increasing pharmacists' scope of practice,
  reducing generic drugs costs, and implementing drug info systems
- increases in funding to provinces at 6% per annum until the 2016-2017 fiscal year;
  from then onwards, increases tied to nominal GDP at a minimum of 3% per annum

2012 Second progress report by the Health Council reviews progress towards 2004 First
Ministers' 10 year plan
- funding is sufficient; however, more innovation is needed including incentivizing
  through models of remuneration
- 46 recommendations made to address the lack of progress

2014 Expiry of current 10 Year Health Care Funding Agreement between federal and
provincial governments

---

**Health Care Expenditure and Delivery in Canada**

- projected total health care expenditure in 2014 was $214.9 billion, 11% of the GDP,
  approximately $6,045 CDN per person
- increasing rate of growth in health spending, surpassing rate of inflation and population growth
  in Canada
- increase in health care costs attributed by some to the increasing number of physicians, and the
  extent and level of services they provide for each patient annually

**Sources of Health Care Funding**
- 70.5% of healthcare spending came from public sector sources in 2014, compared to the US at
  47.8% (OECD average: 73.3%)
- public sector covers services offered on a fee-for-service basis in physicians' offices and in
  hospitals
- public sector does not cover services provided by privately practicing health professionals
  (e.g. dentists, chiropractors, optometrists, massage therapists, osteopaths, physiotherapists,
  podiatrists, psychologists, private duty nurses, and naturopaths), prescription drugs, OTC
  drugs, personal health supplies, and use of residential care facilities
Delivery of Health Care

- Hospital services in Canada are publicly funded but delivered through private, not-for-profit institutions owned and operated by communities, religious organizations, and regional health authorities.
- Other countries, such as the United States (a mix of public and private funding, as well as private for-profit and private not-for-profit delivery) and the United Kingdom (primarily public funding and delivery) have different systems of delivery.

### Physician Licensure and Certification

- Physician certification is governed nationally, while the medical profession in Canada self-regulates under the authority of provincial legislation.
- Self-regulation is based on the premise that the licensing authority must act first and foremost in the interest of the public.

#### Table 2. Key Physician Certification and Licensing Bodies in Canada

<table>
<thead>
<tr>
<th>Certifying Body</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MCC</td>
<td>Certifies physicians with the LMCC. The LMCC is acquired by passing the MCC Qualifying Examination Parts I and II</td>
</tr>
<tr>
<td>RCPSC</td>
<td>Certifies specialists who complete an accredited residency program and pass the appropriate exam. Voluntary membership of the RCPSC is designated FRCPC or FRCSC</td>
</tr>
<tr>
<td>CFPC</td>
<td>Certifies family physicians who complete an accredited residency program and pass the Certification Examination in Family Medicine</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Licensing Body</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPSO</td>
<td>Membership to the provincial licensing authority is mandatory. Licensing authority functions include: • Provide non-transferable licensure to physicians • Maintaining ethical, legal, and competency standards and developing policies to guide doctors • Investigating complaints against doctors • Disciplining doctors guilty of professional misconduct or incompetence • At times of license investiture and renewal, physicians must disclose if they have a condition (such as HIV positivity, drug addiction, or other illnesses that may impact their ability to practice safely)</td>
</tr>
</tbody>
</table>

- The RCPSC and CFPC are responsible for monitoring ongoing CME and professional development.
- Certification by the LMCC plus either the RCPSC or CFPC is a minimum requirement for licensure by most provincial licensing authorities.
Role of Professional Associations

</table>

Ethical and Legal Issues in Canadian Medicine

Introduction to the Principles of Ethics

- ethics addresses
  1. principles and values that help define what is morally right and wrong
  2. rights, duties and obligations of individuals and groups
- the practice of medicine assumes there is one code of professional ethics for all doctors and that they will be held accountable by that code and its implications
- the doctor-patient relationship is formed on trust, which is recognized in the concept of fiduciary duty/responsibility of physician towards patient
  - a fiduciary duty is a legal duty to act solely in another party's interest; one may not profit from the relationship with principals unless he/she has the principal's express consent

Table 4. The Four Principles Approach to Medical Ethics

<table>
<thead>
<tr>
<th>Principle</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Autonomy</td>
<td>Recognizes an individual’s right and ability to decide for himself/herself according to his/her beliefs and values</td>
</tr>
<tr>
<td></td>
<td>Not applicable in situations where informed consent and choice are not possible or may not be appropriate</td>
</tr>
<tr>
<td>Beneficence</td>
<td>The patient-based ‘best interests’ standard that combines doing good, avoiding harm, taking into account the patient’s values, beliefs, and preferences, so far as these are known</td>
</tr>
<tr>
<td></td>
<td>Autonomy should be integrated with the physician’s conception of a patient’s medically-defined best interests</td>
</tr>
<tr>
<td></td>
<td>The aim is to minimize harmful outcomes and maximize beneficial ones</td>
</tr>
<tr>
<td></td>
<td>Paramount in situations where consent/choice is not possible or may not be appropriate</td>
</tr>
<tr>
<td>Non-Maleficence</td>
<td>Obligation to avoid causing harm; primum non nocere (“First, do no harm”)</td>
</tr>
<tr>
<td></td>
<td>A limit condition of the Beneficence principle</td>
</tr>
<tr>
<td>Justice</td>
<td>Fair distribution of benefits and harms within a community, regardless of geography or privilege</td>
</tr>
<tr>
<td></td>
<td>Concept of fairness: Is the patient receiving what he/she deserves – is his/her fair share? Is he/she treated the same as equally situated patients? How does one set of treatment decisions impact others?</td>
</tr>
<tr>
<td></td>
<td>Basic human rights, such as freedom from persecution and the right to have one’s interests considered and respected</td>
</tr>
</tbody>
</table>

CMA Code of Ethics

- The CMA developed a Code of Ethics that acts as a common ethical framework for Canadian physicians. The Code of Ethics is:
  - prepared by physicians for physicians and applies to physicians, residents, and medical students
  - based on the fundamental ethical principles of medicine
  - sources include the Hippocratic Oath, developments in human rights, recent bioethical discussion
  - CMA policy statements address specific ethical issues not mentioned by the code (e.g. abortion, transplantation, and euthanasia)
Confidentiality

Overview of Confidentiality
- a full and open exchange of information between patient and physician is central to a therapeutic relationship
- privacy is the right of patients (which they may forego) while confidentiality is the duty of doctors (which they must respect barring patient consent or the requirements of the law)
- if inappropriately breached by a doctor, he/she can be sanctioned by the hospital, court, or regulatory authority
- based on the ethical principle of patient autonomy, patients have the right to the following:
  - control of their own information
  - the expectation that information concerning them will receive proper protection from unauthorized access by others (see Privacy of Medical Records, below)
- confidentiality may be ethically and legally breached in certain circumstances (e.g. the threat of harm to others)
- unlike the solicitor-client privilege, there is no ‘physician-patient privilege’ by which a physician, even a psychiatrist, can promise the patient absolute confidentiality
- physicians should seek advice from their local health authority or the CMPA before disclosing HIV status of a patient to someone else
  - many jurisdictions make mandatory not only the reporting of serious communicable diseases (e.g. HIV), but also the reporting of those who harbour the agent of the communicable disease
  - physicians failing to abide by such regulations could be subject to professional or civil actions
- the legal duty to maintain patient confidentiality is imposed by provincial health information legislation and precedent-setting cases in the common law

Statutory Reporting Obligations
- legislation has defined specific instances where public interest overrides the patient’s right to confidentiality; varies by province, but may include
  1. suspected child abuse or neglect – report to local child welfare authorities (e.g. Children’s Aid Society)
  2. fitness to drive a vehicle or fly an airplane – report to provincial Ministry of Transportation (see Geriatric Medicine, GM11)
  3. communicable diseases – report to local public health authority (see Population Health and Epidemiology, PH26)
  4. improper conduct of other physicians or health professionals – report to College or regulatory body of the health professional (sexual impropriety by physicians is required reporting in some provinces)
  5. vital statistics must be reported; reporting varies by province (e.g. in Ontario, births are required to be reported within 30 days to Office of Registrar General or local municipality; death certificates must be completed by a MD then forwarded to municipal authorities)
  6. reporting to coroners (see Physician Responsibilities Regarding Death, ELOAM14)
- physicians who fail to report in these situations are subject to prosecution and penalty, and may be liable if a third party has been harmed

Duty to Protect/Warn
- the physician has a duty to protect the public from a known dangerous patient; this may involve taking appropriate clinical action (e.g. involuntary detention of violent patients for clinical assessment), informing the police, or warning the potential victim(s) if a patient expresses an intent to harm
- first established by a Supreme Court of California decision in 1976 (Tarasoff v. Regents of the University of California); supported by Canadian courts
- obliged by the CMA Code of Ethics and recognized by some provincial/territorial regulatory authorities
- concerns of breaching confidentiality should not prevent the MD from exercising the duty to protect; however, the disclosed information should not exceed that required to protect others
- applies in a situation where
  1. there is a clear risk to identifiable person(s);
  2. there is a risk of serious bodily harm or death; and
  3. the danger is imminent (i.e. more likely to occur than not)

Disclosure for Legal Proceedings
- disclosure of health records can be compelled by a court order, warrant, or subpoena

Privacy of Medical Records
- privacy of health information is protected by professional codes of ethics, provincial and federal legislation, the Canadian Charter of Rights and Freedoms, and the physician’s fiduciary duty
• the federal government created the PIPEDA in 2000 which established principles for the collection, use, and disclosure of information that is part of commercial activity (e.g. physician practices, pharmacies, private labs)
• PIPEDA has been superseded by provincial legislation in many provinces, such as the Ontario Personal Health Information Protection Act, which applies more specifically to health information

Duties of Physicians with Regard to the Privacy of Health Information
• inform patients of information-handling practices through various means (e.g. posting notices, brochures and pamphlets, and/or through discussions with patients)
• obtain the patient's expressed consent to disclose information to third parties
  • under Ontario privacy legislation, the patient's expressed consent need not be obtained to share information between health care team members involved in the 'circle of care.' However, the patient may withdraw consent for this sharing of information and may put part in a 'lock box.'
• provide the patient with access to their entire medical record; exceptions include instances where there is potential for serious harm to the patient or a third party
• provide secure storage of information and implement measures to limit access to patient records
• ensure proper destruction of information that is no longer necessary
• regarding taking pictures or videos of patients, findings, or procedures, in addition to patient consent and privacy laws, trespassing laws apply in some provinces

Consent and Capacity

Ethical Principles Underlying Consent and Capacity
• consent is the autonomous authorization of a medical intervention by a patient
• usually the principle of respect for patient autonomy overrides the principle of beneficence
• where a patient cannot make an autonomous decision (i.e. incapable), it is the duty of the SDM (or the physician in an emergency) to act on the patient's known prior wishes or, failing that, to act in the patient's best interests
• there is a duty to discover, if possible, what the patient would have wanted when capable
• central to determining best interests is understanding the patient's values, beliefs, and cultural or religious background
• more recently expressed wishes take priority over remote ones
• patient wishes may be verbal or written
• patients found incapable to make a specific decision should still be involved in that decision as much as possible
• agreement or disagreement with medical advice does not determine findings of capacity/incapacity
• however, patients opting for care that puts them at risk of serious harm that most people would want to avoid should have their capacity carefully assessed

Four Basic Requirements of Valid Consent
1. Voluntary
   • consent must be given free of coercion or pressure (e.g. from parents or other family members who might exert 'undue influence')
   • the physician must not deliberately mislead the patient about the proposed treatment
2. Capable
   • the patient must be able to understand and appreciate the nature and effect of the proposed treatment
3. Specific
   • the consent provided is specific to the procedure being proposed and to the provider who will carry out the procedure (e.g. the patient must be informed if students will be involved in providing the treatment)
4. Informed
   • sufficient information and time must be provided to allow the patient to make choices in accordance with his/her wishes, including
     • the nature of the treatment or investigation proposed and its expected effects
     • all significant risks and special or unusual risks
     • alternative treatments or investigations and their anticipated effects and significant risks
     • the consequences of declining treatment
     • risks that are common sense need not be disclosed (i.e. bruising after venipuncture)
     • answers to any questions the patient may have
   • the reasonable person test – the physician must provide all information that would be needed "by a reasonable person in the patient's position" to be able to make a decision
   • disclose common adverse events (>1/200 chance of occurrence) and serious risks (e.g. death), even if remote
   • it is the physician's responsibility to make reasonable attempts to ensure that the patient understands the information
   • physicians should not withhold information about a legitimate therapeutic option based on personal conscience (e.g. not discussing the option of emergency contraception)
Obtaining Legal Consent

- Consent of the patient must be obtained before any medical intervention is provided; consent can be:
  - verbal or written, although written is usually preferred
  - implied (e.g., a patient holding out their arm for an immunization) or expressed
- Consent is an ongoing process and can be withdrawn or changed after it is given, unless stopping a procedure would put the patient at risk of serious harm
- HCAA of Ontario (1996) covers consent to treatment, admission to a facility, and personal assistance services (e.g., home care)

Exceptions to Consent

1. Emergencies
   - Treatment can be provided without consent where a patient is experiencing severe suffering, or where a delay in treatment would lead to serious harm or death and consent cannot be obtained from the patient or their SDM
   - Emergency treatment should not violate a prior expressed wish of the patient (e.g., a signed Jehovah’s Witness card)
   - If patient is incapable, MD must document reasons for incapacity and why situation is emergent
   - If there is no SDM for the incapable patient, the doctor can apply to the CCB to appoint a patient representative

2. Legislation
   - Mental Health legislation allows for:
     - the detention of patients without their consent
     - psychiatric outpatients may be required to adhere to a care plan in accordance with Community Treatment Orders (see Psychiatry, PS55)
• Public Health legislation allows medical officers of health to detain, examine, and treat patients without their consent (e.g. a patient with TB refusing to take medication) to prevent transmission of communicable diseases

3. Special Situations
• public health emergencies (e.g. an epidemic or communicable disease treatment)
• warrant for information by police

Consequences of Failure to Obtain Valid Consent
• treatment without consent is battery (an offense in tort), even if the treatment is life-saving (excluding situations outlined in exceptions section above)
• treatment of a patient on the basis of poorly informed consent may constitute negligence, also an offense in tort
• the onus of proof that valid consent was not obtained rests with the plaintiff (usually the patient)

Overview of Capacity
• capacity is the ability to:
  1. understand information relevant to a treatment decision
  2. appreciate the reasonably foreseeable consequences of a decision or lack of a decision
• capacity can change over time (e.g. temporary incapacity secondary to delirium)
• most Canadian jurisdictions distinguish capacity to make health care decisions from capacity to make financial decisions; a patient may be deemed capable of one, but not the other
• a person is presumed capable unless there is good evidence to the contrary
• capable patients are entitled to make their own decisions
• capable patients can refuse treatment even if it leads to serious harm or death; however, decisions that put patients at risk of serious harm or death require careful scrutiny

Assessment of Capacity
• capacity assessments must be conducted by a physician and, if appropriate, in consultation with other health care professionals (e.g. another physician, a mental health nurse)
• clinical capacity assessment may include
  1. specific capacity assessment (i.e. capacity specific to the decision at hand)
     1. effective disclosure of information and evaluation of patient’s reason for decision
     2. understanding of
        – his/her condition
        – the nature of the proposed treatment
        – alternatives to the treatment
        – the consequences of accepting and rejecting the treatment
        – the risks and benefits of the various options
     3. for the appreciation needed for decision making capacity, a person must
        – acknowledge the condition that affects him/herself
        – be able to assess how the various options would affect him or her
        – be able to reach a decision and adhere to it, and make a choice, not based primarily upon delusional belief
  2. general impressions
  3. input from psychiatrists, neurologists, etc.
• employ “Aid to Capacity Evaluation”
• a decision of incapacity may warrant further assessment by psychiatrist(s), legal review boards (e.g. in Ontario, the Consent and Capacity Review Board), or the courts
• judicial review is open to patients if found incapable

Treatment of the Incapable Patient in a Non-Emergent Situation
• obtain informed consent from SDM
• an incapable patient can only be detained against his/her will to receive treatment if he/she meets criteria for certification under the Mental Health Act (see Psychiatry, PS54); in such a situation:
  1. document assessment in chart
  2. notify patient of assessment using appropriate Mental Health Form(s) (Form 42 in Ontario)
  3. notify Rights Advisor

Substitute Decision-Makers
• SDMs must follow the following principles when giving informed consent:
  1. values and beliefs held by the patient while capable
  2. whether well-being is likely to improve with vs. without treatment
  3. whether the expected benefit outweighs the risk of harm
• the final decision of the SDM may and should be challenged by the MD if the MD believes the SDM is not abiding by the above principles

Most provinces have legislated hierarchies for SDMs; the hierarchy in Ontario is:
• Legally appointed guardian
• Appointed attorney for personal care, if a power of attorney confers authority for treatment consent (see Powers of Attorney, ELOAM10)
• Representative appointed by the Consent and Capacity Board
• Spouse or partner
• Child (age 16 or older) or parent (unless the patient has only a right of access)
• Public guardian and trustee
Instructional Advance Directives
- allow patients to exert control over his/her care once they are no longer capable
- the patient sets out his/her decisions about future health care, including who he/she would allow
to make treatment decisions on his/her behalf and what types of interventions he/she would want
- takes effect once the patient is incapable with respect to treatment decisions
- in Ontario, a person can appoint a power of attorney for personal care to carry out his/her
advance directives
- patients should be encouraged to review these documents with their family and physicians and
to reevaluate them often to ensure they are current with their wishes

POWERS OF ATTORNEY
- all Guardians and Attorneys have fiduciary duties for the dependent person

Definitions
- Power of Attorney for Personal Care
  - a legal document in which one person gives another the authority to make personal care
decisions (health care, nutrition, shelter, clothing, hygiene, and safety) on their behalf if they
become mentally incapable
- Guardian of the Person
  - someone who is appointed by the Court to make decisions on behalf of an incapable person
in some or all areas of personal care, in the absence of a POA for personal care
- Continuing Power of Attorney for Property
  - a legal document in which a person gives another the legal authority to make decisions about
their finances if they become unable to make those decisions
- Guardian of Property
  - someone who is appointed by the Public Guardian and Trustee or the Courts to look after an
incapable person's property or finances
- Public Guardian and Trustee
  - acts as a SDM of last resort on behalf of mentally incapable people who do not have another
individual to act on their behalf
- Pediatric Aspects of Capacity Covered
  - no age of consent in all provinces and territories except Quebec; consent depends on
patient's decision-making capacity
  - Quebec has a specific age of consent, but common law and case law deem underage legal
minors capable, allowing them to make their own choices
  - infants and children are assumed to lack mature decision-making capacity for consent
  - but they should still be involved (i.e. be provided with information appropriate to their
comprehension level)
  - adolescents are usually treated as adults
  - preferably, assent should still be obtained from patient, even if not capable of giving consent
  - in the event that the physician believes the SDM is not acting in the child's best interests, an
appeal must be made to the local child welfare authorities
  - under normal circumstances, parents have right of access to the child's medical record

Negligence

Ethical Basis
- the doctor-patient relationship is formed on trust, which is recognized in the concept of
fiduciary duty/responsibility of physician towards patient
- a fiduciary duty is a legal duty to act solely in another party's interest and may not profit from
relationship with principals unless they have the principals express consent
- negligence or malpractice is a form of failure on the part of the physician in fulfilling his/her
fiduciary duty in providing appropriate care and leading to harm of the patient (and/or abuse of
patient's trust)

Legal Basis
- physicians are legally liable to their patients for causing harm (tort) through a failure to meet the
standard of care applicable under the circumstances
- standard/duty of care is defined as one that would reasonably be expected under similar
circumstances of an ordinary, prudent physician of the same training, experience, specialization,
and standing
- liability arises from physician's common law duty of care to his/her patients in the doctor/patient
relationship (or, in Quebec, from the Civil Code provisions regarding general civil liability)
- action(s) in negligence (or civil liability) against a physician must be launched by a patient
within a specific prescribed period required by the respective province in which the actions
occurred

- there is no age of consent in Ontario. Capacity is assessed on an individual basis
- errors of care are compatible with non-negligent care if they are ones that
  a reasonably cautious and skilled MD
  could make (i.e. mistakes can be made
due to 'honest error')
- there are four basic elements for action against a
  physician to succeed in negligence:
  1. A duty of care owed to the patient
     (i.e. doctor/patient relationship must
     be established)
  2. A breach of the standard of care
  3. Some harm or injury to the patient
  4. The harm or injury must have been
causally caused by the breach of the duty of care
Truth-Telling

Ethical Basis
• helps to promote and maintain a trusting physician-patient relationship
• patients have a right to be told important information that physicians have regarding their care
• enables patients to make informed decisions about health care and their lives

Legal Basis
• required for valid patient consent (see Consent and Capacity, ELOAM7)
  ▪ goal is to disclose information that a reasonable person in the patient’s position would need in order to make an informed decision (“standard of disclosure”)
• withholding information can be a breach of fiduciary duty and duty of care
• obtaining consent on the basis of misleading information can be seen as negligent

Evidence about Truth-Telling
• most patients want to know what is wrong with them
• although many patients want to protect family members from bad news, they themselves would want to be informed in the same situation
• truth-telling improves adherence and health outcomes
• informed patients are more satisfied with their care
• negative consequences of truth-telling can include decreased emotional well-being, anxiety, worry, social stigmatization, and loss of insurability

Challenges in Truth-Telling
Medical Error
• medical error may be defined as ‘preventable adverse events (AEs)’ caused by the patient’s medical care and not the patient’s underlying illness; some errors may be identified before they harm the patient, so not all error is truly ‘adverse’
• many jurisdictions and professional associations expect and require physicians to disclose medical error; that is, any event that harms or threatens to harm patients must be disclosed to the patient or the patient’s family and reported to the appropriate health authorities
• physicians should disclose to patients the occurrence of AEs or errors caused by medical management, but should not suggest that they resulted from negligence because:
  ▪ negligence is a legal determination
  ▪ error is not equal to negligence (see Negligence, ELOAM10)
• disclosure allows the injured patient to seek appropriate corrective treatment promptly
• physicians should avoid simple attributions as to cause and sole responsibility of others or oneself
• physicians should offer apologies or empathic expressions of regret (e.g. “I wish things had turned out differently”) as these can increase trust and are not admissions of guilt or liability
• Apology Acts across Canada protect apologies, both as expressions of regret and admissions of responsibility, from being used as evidence of liability and negligence

Breaking Bad News
• ‘bad news’ may be any information that reveals conditions or illnesses threatening the patient’s sense of well-being
• caution patients in advance of serious tests about possible bad findings
• give warnings of impending bad news (see sidebar for example) and make sure you provide time for the patient
• poorly done disclosure may be as harmful as non-disclosure
• truth-telling may be a process requiring multiple visits
• adequate support should be provided along with the disclosure of difficult news
• SPIKES protocol was developed to facilitate “breaking bad news”

Arguments Against Truth-Telling
• may go against certain cultural norms and expectations
• may lead to patient harm and increased anxiety
• 10-20% of patients prefer not to be informed
• medical uncertainty may result in the disclosure of uncertain or inaccurate information

Exceptions to Truth-Telling
• a patient may waive his/her right to know the truth about their situation (i.e. decline information that would normally be disclosed) when
  ▪ the patient clearly declines to be informed
  ▪ a strong cultural component exists that should be respected and acknowledged
• the patient may wish others to be informed and make the medical decisions for him/her
• the more weighty the consequences for the patient from non-disclosure, the more carefully one must consider the right to ignorance
• ‘emergencies’: an urgent need to treat may legitimately delay full disclosure; the presumption is that most people would want such treatment and the appropriate SDM cannot be found

Protocol to Break Bad News: SPIKES
S Setting the scene and listening skills
P Patient’s perception of condition and seriousness
I Invitation from patient to give information
K Knowledge – giving medical facts
E Explore emotions and empathize
S Strategy and summary
Source: Baile WF, Buckman R. 2000

CPSO Policy on Truth-Telling
Physicians should provide patients with whatever information that will, from the patient’s perspective, have a bearing on medical decision-making and communicate that information in a way that is comprehensible to the patient

Adverse Event
An unintended injury or complication from health care management resulting in disability, death, or prolonged hospital stay

Open Disclosure of AEs: Transparency and Safety in Health Care
Health care providers have a fiduciary duty to disclose AEs to their patients. Professional societies codify medical providers’ ethical requirement to disclose AEs to patients in accordance with the four principles of biomedical ethics. Transparency and honesty in relationships with patients create opportunities for learning that lead to systems improvements in health care organizations. Disclosure invariably becomes a component of broad systems improvement and is closely linked to improving patient safety.

Truth-Telling in Discussing Prognosis in Advanced Life-Limiting Illnesses
Palliat Med 2007;21(6):507-517
Many physicians express discomfort at having to breach the topic of prognosis, including limited life expectancy, and may withhold information or not disclose prognosis.
A systematic review of 46 studies relating to truth-telling in discussing prognosis with patients with progressive, advanced life-limiting illnesses and their caregivers showed that although the majority of physicians believed that patients and caregivers should be told the truth about the prognosis, in practice, many either avoid discussing the topic or withheld information. Reasons include perceived lack of training, stress, no time to attend to the patient’s emotional needs, fear of a negative impact on the patient, uncertainty about prognosis, requests from family members to withhold information and a feeling of inadequacy or hopelessness regarding the unavailability of further curative treatment.
Evidence suggests that patients can discuss the topic without it having a negative impact on them.

Source: Baile WF, Buckman R. 2000
• ‘therapeutic privilege’
  ▪ withholding of information by the clinician in the belief that disclosure of the information
    would itself lead to severe anxiety, psychological distress or physical harm to the patient
  ▪ clinicians should avoid invoking therapeutic privilege due to its paternalistic overtones and is
    a defense of non-disclosure that is rarely accepted anymore
  ▪ it is often not the truth that is unpalatable; it is how it is conveyed that can harm the patient

Ethical Issues in Health Care

Managing Controversial and Ethical Issues in Practice
• discuss in a non-judgmental manner
• ensure patients have full access to relevant and necessary information
• identify if certain options lie outside of your moral boundaries and refer to another physician if
  appropriate
• consult with appropriate ethics committees or boards
• protect freedom of moral choice for students or trainees

Source: MCC-CLEO Objectives 1998

Reproductive Technologies

Overview of the Maternal-Fetal Relationship
• in general, maternal and fetal interests align
• in some situations, a conflict between maternal autonomy and the best interests of the fetus may
  arise

Ethical Issues and Arguments
• principle of reproductive freedom: women have the right to make their own reproductive
  choices
• coercion of a woman to accept efforts to promote fetal well-being is an unacceptable
  infringement of her personal autonomy

Legal Issues and Arguments
• the law upholds a woman's right to life, liberty, and security of person, and does not recognize
  fetal rights; key aspects of the mother's rights include
  ▪ if a woman is competent and refuses medical advice, her decision must be respected even if
    the fetus will suffer
  ▪ the fetus does not have legal rights until it is born alive and with complete delivery from the
    body of the woman

Royal Commission on New Reproductive Technologies (1993) recommendations:
1. medical treatment must never be imposed upon a competent pregnant woman against her
   wishes
2. no law should be used to confine a pregnant woman in the interest of her fetus
3. the conduct of a pregnant woman in relation to her fetus should not be criminalized
4. child welfare should never be used to control a woman's behaviour during pregnancy
5. civil liability should never be imposed upon a woman for harm done to her fetus during
   pregnancy

Examples involving the use of established guidelines
• a woman is permitted to refuse HIV testing during pregnancy, even if vertical transmission to
  fetus results
• a woman is permitted to refuse Caesarean section in labour that is not progressing, despite
  evidence of fetal distress

Advanced Reproductive Therapies
• includes non-coital insemination, hormonal ovarian stimulation, and IVF
• topics with ethical concerns
  ▪ donor anonymity vs. child-centred reproduction (i.e. knowledge about genetic medical
    history)
  ▪ preimplantation genetic testing for diagnosis before pregnancy
  ▪ use of new techniques without patients appreciating their experimental nature
  ▪ embryo status – the Supreme Court of Canada maintains that fetuses are "unique" but not
    persons under law; this view would likely apply to embryos as well
  ▪ access to ART
  ▪ private vs. public funding of ART
  ▪ social factors limiting access to ART (e.g. same-sex couples)
  ▪ the ‘commercialization’ of reproduction

Examples of Warning of Impending Bad News
"I have something difficult to tell you…"
"This may come as a shock to you, but the tests indicate…"
"There is no easy way for me to tell you this, so I will tell you straight away that you have a serious problem…"
**Fetal Tissue**
- pluripotent stem cells can currently be derived from human embryonic and fetal tissue
- potential uses of stem cells in research
  - studying human development and factors that direct cell specialization
  - evaluating drugs for efficacy and safety in human models
  - cell therapy: using stem cells grown *in vitro* to repair or replace degenerated/destroyed/malignant tissues (e.g. Parkinson’s disease)
- genetic treatment aimed at altering somatic cells (e.g. myocardial or immunological cells) is acceptable and ongoing

**Induced Abortion**
- CMA definition of induced abortion: the active termination of a pregnancy before fetal viability (fetus >500 g or >20 wk GA)
- CMA policy on induced abortion
  1. induced abortion should not be used as an alternative to contraception
  2. counselling on contraception must be readily available
  3. full and immediate counselling services must be provided in the event of unwanted pregnancy
  4. there should be no delay in the provision of abortion services
  5. no patient should be compelled to have a pregnancy terminated
  6. physicians should not be compelled to participate in abortion – if morally opposed, the physician should inform the patient so she may consult another physician
  7. no discrimination should be directed towards either physicians who do not perform or assist at induced abortions or physicians who do
  8. induced abortion should be uniformly available to all women in Canada and health care insurance should cover all the costs (note: the upper limit of GA for which coverage is provided varies between provinces)
  9. elective termination of pregnancy after fetal viability may be indicated under exceptional circumstances

**Ethical and Legal Concerns and Arguments**
- no law currently regulates abortion in Canada
- it is a woman’s medical decision to be made in consultation with whom she wishes; there is no mandatory role for spouse/family
- 2nd and even 3rd trimester abortions are not illegal in Canada, but are usually only carried out when there are serious risks to the woman’s health, or if the fetus has died *in utero* or has major malformations (e.g. anencephaly)

**Prenatal/Antenatal Genetic Testing**
- uses
  1. to confirm a clinical diagnosis
  2. to detect genetic predisposition to a disease
  3. allows preventative steps to be taken and helps patient prepare for the future
  4. gives parents the option to terminate a pregnancy or begin early treatment
- ethical dilemmas arise because of the sensitive nature of genetic information; important considerations of genetic testing include:
  - the individual and familial implications
  - its pertaining to future disease
  - its ability to identify disorders for which there are no effective treatments or preventive steps
  - its ability to identify the sex of the fetus
- ethical issues and arguments regarding the use of prenatal/antenatal genetic testing include:
  - obtaining informed consent is difficult due to the complexity of genetic information
  - doctor’s duty to maintain confidentiality vs. duty to warn family members
  - risk of social discrimination (e.g. insurance) and psychological harm

**Legal Aspects**
- no current specific legislation exists
- testing requires informed consent
- no standard of care exists for clinical genetics, but physicians are legally obligated to inform patients that prenatal testing exists and is available
- a physician can breach confidentiality terms in order to warn family members about a condition if harm can possibly be prevented via treatment or prevention (e.g. familial adenomatous polyposis, *Gastroenterology*, G34)

**Genetic Testing: Ethically Appropriate Actions**
- thorough discussion and realistic planning with patient before testing is done
- genetic counselling for delivery of complex information
End-of-Life Care

Overview of Palliative and End-of-Life Care
- focus of care is comfort and respect for person nearing death and maximizing quality of life for patient, family, and loved ones
- appropriate for any patient at any stage of a life-limiting illness
- may occur in a hospital, hospice, in the community, or at home
- often involves an interdisciplinary team of caregivers
- addresses the medical, psychosocial, and spiritual dimensions of care

Euthanasia and Physician-Assisted Suicide
- *euthanasia*: a deliberate act undertaken by one person with the intention of ending the life of another person to relieve that person's suffering, where the act is the cause of death
- *physician-assisted suicide*: the act of intentionally killing oneself with the assistance of a physician who deliberately provides the knowledge and/or the means

Common Ethical Arguments/Opinions
- patient has the right to make autonomous choices about the time and manner of their own death
- belief that there is no ethical difference between the acts of euthanasia/assisted suicide and foregoing life-sustaining treatments
- belief that these acts benefit terminally ill patients by relieving suffering
- patient autonomy has limits
- death should be the consequence of the morally justified withdrawal of life-sustaining treatments only in cases where there is a fatal underlying condition, and it is the condition (not the withdrawal of treatment) that causes death

Legal Aspect
- in Canada, euthanasia is a punishable offence under the Criminal Code of Canada
- in the *Carter v. Canada* decision of February 2015, physician-assisted suicide ruled to be not criminal, with the decision taking effect in 2016

Acceptable Use of Palliative and End-of-Life Care
- the use of palliative sedation with opioids in end-of-life care, knowing that death may occur as an unintended consequence (principle of double effect) is distinguished from euthanasia and assisted suicide where death is the primary intent
- the appropriate withdrawal of life-support is distinguished from euthanasia and assisted suicide as it is seen as allowing the underlying disease to take its ‘natural course’
- consent for withdrawal of life-support must be sought from SDMs, as ruled in *Cuthbertson v. Rasouli* in 2013
- refusals of care by the patient that may lead to death ought to be carefully explored by the physician to rule out any ‘reversible factors’ (e.g. poor palliation, depression, poverty, ill-education, isolation) that may be hindering authentic choice

Physician Responsibilities Regarding Death
- physicians are required by law to complete a medical certificate of death unless the coroner needs notification; failure to report death is a criminal offence
- *Coroner’s Act, 1990* (specific to Ontario, similar in other provinces) requires physicians to notify a coroner or police officer if death occurs:
  - due to violence, negligence, misconduct, misadventure, or malpractice
  - during pregnancy or is attributable to pregnancy
  - suddenly and unexpectedly
  - from disease which was not treated by a legally qualified medical practitioner
  - from any cause other than disease
  - under suspicious circumstances
- coroner investigates these deaths, as well as deaths that occur in psychiatric institutions, jails, foster homes, nursing homes, hospitals to which a person was transferred from a facility, institution or home, etc.
- in consultation with forensic pathologists and other specialists, the coroner establishes:
  - the identity of the deceased
  - where and when the death occurred
  - the medical cause of death
  - the means of death (i.e. natural, accidental, suicide, homicide, or undetermined)
- coroners do not make decisions regarding criminality or legal responsibility

Physician Competence and Professional Conduct

CanMEDS Competencies (Ethical/Policy Statement)
- a framework of professional competencies established by the MCC as objectives for the MCC Qualifying Exam
- further information on MCC objectives can be found at www.mcc.ca

Legal Considerations
- physicians' conduct and competence are legally regulated to protect patients and society via mandatory membership to provincial governing bodies (e.g., the CPSO)
- physicians are legally required to maintain a license with the appropriate authority, and are thus legally bound to outlined policies on matters of conduct within his/her medical practice

Common Policies on Physician Conduct
- physicians must ensure that patients have access to continuous on-call coverage and are never abandoned
- sexual conduct with patients, even when consented to by the patient, is a serious matter that can lead to accusations of battery by the patient and provincial governing body. Important notes on this topic include:
  - inappropriate sexual conduct includes intercourse, undue touching, references to sexual matters, sexual jokes, and physician presence when capable patients undress or dress
  - in specified situations, physicians may have a personal relationship with a patient provided a year has passed since the last therapeutic contact
  - physicians are permanently prohibited from personal relationships with patients whom they saw for psychotherapy
  - in Ontario, physicians must report any colleagues of whom they have information regarding sexual impropriety (as per CPSO Code of Ethics)
- physicians must maintain adequate records for each patient, which include:
  - demonstration that care has been continuous and comprehensive
  - minimal standards for record-keeping, including diagnosis, differential diagnosis, appropriate tests and referrals, and a coherent patient record (full standards available at www.cpsso.on.ca)
  - records stored for 10 years in most jurisdictions
  - although the medical record is the property of the physician or an institution, the patient or the patient's delegate must be allowed full access to information in the medical record upon (usually written) request
- in the hospital, physicians must ensure their own competence, respect hospital by-laws and regulations, practice only within the limits of granted privileges, cooperate with other hospital personnel, and maintain adequate hospital records

Research Ethics
- involves the systematic analysis of ethical dilemmas arising during research involving human subjects to ensure that:
  - study participants are protected
  - clinical research is conducted to serve the interests of the participants and/or society as a whole
  - major ethical dilemmas arise when a physician's obligation to the patient comes into conflict with other obligations and incentives
  - any exceptions to disclosure for therapeutic consent do not apply in an experimental situation
  - important ethical principles to consider when conducting research on human subjects were laid out in the Declaration of Helsinki, the Belmont Report, and the Tri-Council Policy Statement: Ethical Conduct on Research Involving Human Subjects
Table 5. Ethical Principles for Research Involving Human Subjects

- Patient’s participation in research should not put him/her at a known or probable disadvantage with respect to medical care (i.e. cannot deny participants in research ‘known effective care’, such as randomizing some depressed patients to a placebo arm)
- Participant’s voluntary and informed choice is usually required, except in special circumstances (i.e. chart reviews without patient contact, or emergency situations for which there is no accepted or helpful standard of care and the proposed intervention is not likely to cause more harm than such patients already face)
- Access to the treatment that is considered standard (i.e. placebo-controlled trials are generally acceptable where patients still receive the standard of care and are informed about the placebo arm and what that entails)
- Must employ a scientifically valid design to answer the research question (ensured via peer review, expert opinion)
- Must demonstrate sufficient value to justify the risk posed to participants
- Must be conducted honestly (i.e. carried out as stated in the approved protocol)
- Findings must be reported promptly and accurately without exaggeration, to allow practicing clinicians to draw reasonable conclusions
- Patients must not be enticed into risky research by the lure of money and investigators must not trade the interests of patients for disproportionate recompense by a sponsor; both participants and investigators are due fair recompense for their time and efforts
- Any significant interventional trial ought to have a data safety monitoring board that is independent of the sponsor and can ensure safety of the ongoing trial

Physician-Industry Relations

- Health care delivery in Canada involves collaboration between physicians and the pharmaceutical and health supply industries in the areas of research, education, and clinical evaluation packages (i.e. product samples)
- Physicians have a responsibility to ensure that their participation in such collaborative efforts is in keeping with their duties to their patients and society.
- Gifts or free products from the pharmaceutical industry are usually inappropriate
  - Sponsorship for travel and fees for conference attendance may be accepted only where the physician is a conference presenter and not just in attendance.
- Physicians receiving such sponsorship must disclose this at presentations and/or in written articles

Resource Allocation

- Definition: the distribution of goods and services to programs and people.
- Physicians have the duty to inform patients about therapeutic options even if they are not available.
- Physicians must make health care resources available to patients in a manner which is fair and equitable, without bias or discrimination
  - Need and benefit are morally relevant criteria for resource allocation.
  - Gender, sexual orientation, religion, level of education, or age alone are morally irrelevant criteria.
- Ethical dilemmas that arise when deciding how best to allocate resources
  - Fair chances versus best outcome: favouring best outcome vs. giving all patients fair access to limited resources (e.g. transplant list prioritization).
  - Priorities problem: how much priority should the sickest patients receive?
  - Aggregation problem: modest benefits to many vs. significant benefits to few.
  - Democracy problem: when to rely on a fair democratic process to arrive at a decision.

Guidelines for Appropriately Allocating Resources

- The physician’s primary obligation is to:
  - Protect and promote the welfare and best interests of his/her patients.
  - Choose interventions known to be beneficial on the basis of evidence of effectiveness.
  - Seek the tests or treatments that will accomplish the diagnostic or therapeutic goal for the least cost.
  - Advocate for one’s patients, but avoid manipulating the system to gain unfair advantage for them.
  - Resolve conflicting claims for scarce resources justly, on the basis of morally relevant criteria such as need and benefit, using fair and publicly defensible procedures.
  - Inform patients of the impact of cost constraints on care, but in a sensitive way.
  - Seek resolution of unacceptable shortages at the level of hospital management or government.
Conscientious Objection

Patients Refusing Treatment
- in accordance with the principle of autonomy, it is generally acceptable for competent patients to refuse medical interventions for themselves or others, although exceptions may occur
- if parents or SDMs make decisions that are clearly not in the “best interests” of an incapable child, physicians may have ethical grounds for administering treatment, depending on the acuity of the clinical situation
- in high-acuity scenarios (e.g., refusing blood transfusion based on religious grounds for a child in hemorrhagic shock), physicians have a stronger obligation to act in the child’s best interests
- in lower acuity scenarios (e.g., refusing childhood immunization in a developed nation) there is a stronger obligation to respect the autonomy of the decision-makers
- pursuing traditional First Nations healing (in conjunction or in the place of standard biomedical therapy) is legally considered a constitutionally protected right, which can be made by a SDM, as ruled in Hamilton Health Sciences v. DH in 2014

Physicians Refusing to Provide Treatment
- physicians may refuse to provide treatment or discontinue relationships with patients, but must ensure these patients can access services elsewhere (e.g. a pediatrician who refuses to treat an unvaccinated child should refer the family to another practice)

Overview of Anesthesia

- an anesthesia: lack of sensation/perception
- approach to anesthesia
  1. pre-operative assessment
  2. patient optimization
  3. plan anesthetic
     various types of anesthesia
     pre-medication
     airway management
     monitors
     induction
     maintenance
     extubation
  4. post-operative care

Types of Anesthesia

- general
  - general anesthesia (GA)
  - total IV anesthesia (TIVA)
- regional
  - spinal, epidural
  - peripheral nerve block
  - IV regional
- local
  - local infiltration
  - topical
- sedation
  - monitored anesthesia care
  - note that different types of anesthesia can be combined (general + regional)

General Anesthesia
- induction, maintenance and extubation

Pre-Operative Assessment

Purpose
- identify patient's medical and surgical issues
- allow for questions to help allay any fears or concerns patient and/or family may have
- arrange further investigations, consultations and treatments for patients not yet optimized
- plan and consent for anesthetic techniques

History and Physical

History
- age, gender
- indication for surgery
- surgical/anesthetic Hx: previous anesthetics, any complications, previous intubations, medications, drug allergies, post-operative N/V
- FHx: abnormal anesthetic reactions, malignant hyperthermia, pseudocholinesterase deficiency (see Uncommon Complications, A26)
- PMHx
  - CNS: seizures, TIA/strokes, raised ICP, spinal disease, aneurysm
  - CVS: angina/CAD, MI, CHF, HTN, valvular disease, dysrhythmias, peripheral vascular disease (PVD), conditions requiring endocarditis prophylaxis, exercise tolerance, CCS/NYHA class (Cardiology and Cardiac Surgery, C37 for NYHA classification)
  - respiratory: smoking, asthma, COPD, recent upper respiratory tract infection, sleep apnea
  - GI: GERD, liver disease, NPO status
  - renal: insufficiency, dialysis, chronic kidney disease
  - hematologic: anemia, coagulopathies, blood dyscrasias
  - MSK: conditions associated with difficult intubations – arthritides (e.g. rheumatoid arthritis), cervical tumours, cervical infections/abscesses, trauma to cervical spine, previous cervical spine surgery, Trisomy 21, scleroderma, conditions affecting neuromuscular junction (e.g. myasthenia gravis)
  - endocrine: DM, thyroid disorders, adrenal disorders
  - other: morbid obesity, pregnancy, ethanol/other drug use

Physical Exam
- weight, height, BP, pulse, respiratory rate, oxygen saturation
- general assessment of nutrition, hydration and mental status
- focused physical exam of the CNS, CVS, and respiratory systems
- general assessment of nutrition, hydration, and mental status
• airway assessment
  - done to determine intubation difficulty (no single test is specific or sensitive)
  - cervical spine stability and neck movement – upper cervical spine extension, lower cervical spine flexion (“sniffing position”)
  - Mallampati classification
  - “3-2-1 rule”
    - thyromental distance (distance of lower mandible in midline from the mentum to the thyroid notch); <3 finger breadths (<6 cm) is associated with difficult intubation
    - mouth opening (<2 finger breadths is associated with difficult intubation)
    - anterior jaw subluxation (<1 finger breadth is associated with difficult intubation)
  - tongue size
  - dentition, dental appliances/prosthetic caps, existing chipped/loose teeth – must inform patients of rare possibility of damage
  - nasal passage patency (if planning nasotracheal intubation)
  - assess difficulty of ventilation
• examination of anatomical sites relevant to lines and blocks
  - bony landmarks and suitability of anatomy for regional anesthesia (if relevant)
  - sites for IV, central venous pressure (CVP), and pulmonary artery (PA) catheters

American Society of Anesthesiology Classification

- common classification of physical status at the time of surgery
- a gross predictor of overall outcome, NOT used as stratification for anesthetic risk (mortality rates)
- ASA 1: a healthy, fit patient
- ASA 2: a patient with mild systemic disease
  - e.g. controlled Type 2 DM, controlled essential HTN, obesity, smoker
- ASA 3: a patient with severe systemic disease that limits activity
  - e.g. stable CAD, COPD, DM, obesity
- ASA 4: a patient with incapacitating disease that is a constant threat to life
  - e.g. unstable CAD, renal failure, acute respiratory failure
- ASA 5: a moribund patient not expected to survive 24 h without surgery
  - e.g. ruptured abdominal aortic aneurysm (AAA), head trauma with increased ICP
- ASA 6: declared brain dead, a patient whose organs are being removed for donation purposes
- for emergency operations, add the letter E after classification (e.g. ASA 3E)

Pre-Operative Optimization

- in general, prior to elective surgery
  - any fluid and/or electrolyte imbalance should be corrected
  - extent of existing comorbidities should be understood and these conditions should be optimized prior to surgery
  - medications may need to be adjusted

Medications

- pay particular attention to cardiac and respiratory medications, opioids and drugs with many side effects and interactions
- **pre-operative medications to consider**
  - prophylaxis
    - risk of GE reflux: sodium citrate 30 mL PO and/or ranitidine 150-300 mg PO and/or metoclopramide 10 mg PO 30 min-1 h prior to surgery
    - risk of infective endocarditis, GI/GU interventions: antibiotics
    - risk of adrenal suppression: steroid coverage
    - anxiety: consider benzodiazepines
    - COPD, asthma: bronchodilators
    - CAD risk factors: nitroglycerin and β-blockers
- **pre-operative medications to stop**
  - oral antihyperglycemics: stop on morning of surgery
  - antidepressants: stop on morning of surgery
  - ACE inhibitors and angiotension receptor blockers: may stop on morning of surgery (controversial)
  - warfarin (consider bridging with heparin), anti-platelet agents (e.g. clopidogrel)
    - discuss perioperative use of ASA, NSAIDs with surgeon
  - in patients undergoing non-cardiac surgery, starting or continuing low-dose aspirin in the perioperative period does not appear to protect against post-operative MI or death, but increases the risk of major bleeding
    - note: this does not apply to patients with bare metal stents or drug-eluting coronary stents
- **pre-operative medications to adjust**
  - insulin (consider insulin/dextrose infusion or holding dose), prednisone, bronchodilators

Hypertension

- BP <180/110 is not an independent risk factor for perioperative cardiovascular complications
- target sBP <180 mmHg, dBP <110 mmHg
- assess for end-organ damage and treat accordingly
**Coronary Artery Disease**

- ACC/AHA Guidelines (2014) recommend that at least 60 days should elapse after a MI before a noncardiac surgery in the absence of a coronary intervention
  - this period carries an increased risk of reinfarction/death
- if operative procedure is essential and cannot be delayed, invasive intra- and post-operative ICU monitoring is needed
- mortality with perioperative MI is 20-50%
- peroperative β-blockers
  - may ↓ cardiac events and mortality (controversial, as recent data suggests ↑ stroke risk)
  - continue β-blocker if patient is routinely taking it prior to surgery
  - consider initiation of β-blocker in
    - patients with CAD or indication for β-blocker
    - intermediate risk surgery, especially vascular surgery

**Respiratory Diseases**

- smoking
  - adverse effects: altered mucus secretion and clearance, decreased small airway caliber, and altered immune response
  - abtain at least 8 wk pre-operatively if possible
  - if unable, abstaining even 24 h pre-operatively has shown benefit
- asthma
  - pre-operative management depends on degree of baseline asthma control
  - increased risk of bronchospasm from intubation, delivery of desflurane
    - administration of short course (up to 1 wk) pre-operative corticosteroids and inhaled β2-agonists decreases the risk of bronchospasm and does not increase the risk of infection or delay wound healing
  - avoid non-selective β-blockers due to risk of bronchospasm
  - cardioselective β-blockers (metoprolol, atenolol) do not increase risk of bronchospasm in the short-term
  - delay elective surgery for poorly controlled asthma (increased cough or sputum production, active wheezing)
  - delay elective surgery by a minimum of 6 wk if patient develops URTI
- COPD
  - anesthesia, surgery (especially abdominal surgery, in particular upper abdominal surgery) and pain predispose the patient to atelectasis, bronchospasm, pneumonia, prolonged need for mechanical ventilation, and respiratory failure
  - pre-operative ABG for all COPD stage II and III patients to assess baseline respiratory acidosis and plan post-operative management of hypercapne
  - cancel/delay elective surgery for acute exacerbation

**Aspiration**

- increased risk of aspiration with
  - decreased LOC
  - trauma
  - meals within 8 h
  - suspected sphincter incompetence (GERD, hiatus hernia, nasogastric tube)
  - increased abdominal pressure (pregnancy, obesity, bowel obstruction, acute abdomen)
  - laryngeal mask vs. endotracheal tube (ETT)
- management
  - reduce gastric volume and acidity
  - delay inhibiting airway reflexes with muscular relaxants
  - employ rapid sequence induction (see Rapid Sequence Induction, A16)

**Fasting Guidelines**

**Fasting Guidelines Prior to Surgery (Canadian Anesthesiologists’ Society)**

- 8 h after a meal that includes meat, fried or fatty foods
- 6 h after a light meal (such as toast or crackers) or after ingestion of infant formula or non-human milk
- 4 h after ingestion of breast milk
- 2 h after clear fluids (water, black coffee, tea, carbonated beverages, juice without pulp)
Hematological Disorders

- history of congenital or acquired conditions (sickle cell anemia, factor VIII deficiency, ITP, liver disease)
- evaluate hemoglobin, hematocrit and coagulation profiles when indicated (Table 1)
- anemia
  - pre-operative treatments to increase hemoglobin (erythropoietin or pre-admission blood collection in certain populations)
- coagulopathies
  - discontinue or modify anticoagulation therapies (warfarin, clopidogrel, ASA) in advance of elective surgeries
  - administration of reversal agents if necessary: vitamin K, FFP, prothrombin complex concentrate, recombinant activated factor VII

Endocrine Disorders

- diabetes mellitus
  - clarify type 1 vs. type 2
  - clarify treatment – oral antihyperglycemics and/or insulin
  - assess glucose control with history and HbA1c; well controlled diabetics have more stable glucose levels intraoperatively
  - end organ damage: be aware of damage to CVS, renal, and nervous systems, including autonomic neuropathy
  - formulate intraoperative glucose management plan based on type (1 vs. 2), glucose control, and extent of end organ damage
- hyperthyroidism
  - can experience sudden release of thyroid hormone (thyroid storm) if not treated or well-controlled preoperatively
  - treatment: β-blocking agents and pre-operative prophylaxis
- adrenocortical insufficiency (Addison's, exogenous steroid use)
  - consider intraoperative steroid supplementation

Obesity and Obstructive Sleep Apnea

- assess for comorbid conditions in obese patient (independent risk factor for CVD, DM, OSA, cholelithiasis, HTN)
- previously undiagnosed conditions may require additional testing to characterize severity
- both obesity and OSA increase risk of difficult ventilation, intubation and post-operative respiratory complications
  - risk may be magnified with both diseases present

Monitoring

Canadian Guidelines to the Practice of Anesthesia and Patient Monitoring

- an anesthetist present: "the only indispensable monitor"
- a completed pre-anesthetic checklist: including ASA class, NPO policy, Hx and investigations
- a perioperative anesthetic record: HR and BP every 5 min, dose and route of drugs and fluids
- continuous monitoring: see Routine Monitors for All Cases

Routine Monitors for All Cases

- pulse oximeter, apparatus to measure BP, electrocardiography and capnography are required for general anesthesia and sedation (Ramsey Sedation Scale 4-6), agent-specific anesthetic gas monitor when inhalational anesthetic agents are used
- the following must also be available: temperature probe, peripheral nerve stimulator, stethoscope, appropriate lighting, spirometer

Elements to Monitor

- anesthetic depth
  - inadequate: blink reflex present when eyelashes lightly touched, HTN, tachycardia, tearing or sweating
  - excessive: hypotension, bradycardia
- oxygenation: pulse oximetry, fraction of inspired O₂ (FiO₂)
- ventilation: verify correct position of ETT, chest excursions, breath sounds, ET₃₀₂ analysis, end tidal inhaled anesthesia analysis
- circulation: pulse, heart sounds, BP, telemetry, oximetry, CVP, pulmonary capillary wedge pressure
- temperature
Airway Management

**Airway Anatomy**

- resistance to airflow through nasal passages accounts for approximately 2/3 of total airway resistance
- pharyngeal airway extends from posterior aspect of the nose to cricoid cartilage
- glottic opening (triangular space formed between the true vocal cords) is the narrowest segment of the laryngeal opening in adults
- the glottic opening is the space through which one visualizes proper placement of the ETT
- the trachea begins at the level of the thyroid cartilage, C6, and bifurcates into the right and left main bronchi at T4-T5 (approximately the sternal angle)

**Methods of Supporting Airways**

1. non-definitive airway (patent airway)
   - jaw thrust/chin lift
   - oropharyngeal and nasopharyngeal airway
   - bag mask ventilation
   - laryngeal mask airway
2. definitive airway (patent and protected airway)
   - endotracheal tube
   - surgical airway (cricothyrotomy or tracheostomy)

**Table 2. Methods of Supporting the Airway**

Tracheal Intubation

Preparing for Intubation
- failed attempts at intubation can make further attempts more difficult due to tissue trauma
- plan, prepare, and assess for potential difficulties (see Pre-Operative Assessment, A2)
- ensure equipment is available and working (test ETT cuff, check laryngoscope light and suction, machine check)
- pre-oxygenate/denitrogenate: patient breathes 100% O₂ for 3-5 min or for 4 vital capacity breaths
- may need to suction mouth and pharynx first

Proper Positioning for Intubation
- align the three axes (mouth, pharynx, and larynx) to allow visualization from oral cavity to glottis
  - “snifﬁng position”: ﬂexion of lower C-spine (C5-C6), bow head forward, and extension of upper C-spine at atlanto-occipital joint (C1), nose in the air
  - contraindicated in known/suspected C-spine fracture/instability
- laryngoscope tip placed in the epiglottic vallecula in order to visualize cord

Tube Insertion
- laryngoscopy and ETT insertion can incite a signiﬁcant sympathetic response via stimulation of cranial nerves 9 and 10 due to a “foreign body reﬂex” in the trachea, including tachycardia, dysrhythmias, myocardial ischemia, increased BP, and coughing
- a malpositioned ETT is a potential hazard for the intubated patient
  - if too deep, may result in right endobronchial intubation, which is associated with left-sided atelectasis and right-sided tension pneumothorax
  - if too shallow, may lead to accidental extubation, vocal cord trauma, or laryngeal paralysis as a result of pressure injury by the ETT cuff
- the tip of ETT should be located at the midpoint of the trachea at least 2 cm above the carina and the proximal end of the cuff should be placed at least 2 cm below the vocal cords
  - approximately 20-23 cm mark at the right corner of the mouth for men and 19-21 cm for women
Confirmation of Tracheal Placement of ETT
- direct
  - visualization of ETT passing through cords
  - bronchoscopic visualization of ETT in trachea
- indirect
  - \(\text{ETCO}_2\) in exhaled gas measured by capnography
  - auscultate for equal breath sounds bilaterally and absent breath sounds over epigastrium
  - bilateral chest movement, condensation of water vapour in ETT visible during exhalation and no abdominal distention
  - filling of reservoir bag during exhalation
  - CXR (rarely done): only confirms position of the tip of ETT and not that ETT is in the trachea
- esophageal intubation suspected when
  - \(\text{ETCO}_2\) zero or near zero on capnograph
  - abnormal sounds during assisted ventilation
  - impairment of chest excursion
  - hypoxia/cyanosis
  - presence of gastric contents in ETT
  - distention of stomach/epigastrium with ventilation

Complications During Laryngoscopy and Intubation
- dental damage
- laceration (lips, gums, tongue, pharynx, esophagus)
- laryngeal trauma
- esophageal or endobronchial intubation
- accidental extubation
- insufficient cuff inflation or cuff laceration: results in leaking and aspiration
- laryngospasm (see Extubation, A18 for definition)
- bronchospasm

Difficult Airway
- difficulties with bag-mask ventilation, supraglottic airway, laryngoscopy, passage of ETT through the cords, infraglottic airway or surgical airway
- algorithms exist for difficult airways (Can J Anesth 2013;60:1119-1138; Anesthesiology 2003;98:3273; Anesthesiology 2013;118:251-270), see Figures 14 and 15, A30, A31
- pre-operative assessment (history of previous difficulties, airway examination) and pre-operative assessment (history of previous intubation history)
- if difficult airway expected, consider
  - awake intubation
  - intubating with bronchoscope, trachlight (lighted stylet), fibre optic laryngoscope, glidescope, etc.
- if intubation unsuccessful after induction
  1. CALL FOR HELP
  2. ventilate with 100% \(O_2\) via bag and mask
  3. consider returning to spontaneous ventilation and/or waking patient
- if bag and mask ventilation inadequate
  1. CALL FOR HELP
  2. attempt ventilation with oral airway
  3. consider/attempt LMA
  4. emergency invasive airway access (e.g. rigid bronchoscope, cricothyrotomy, or tracheostomy)

Oxygen Therapy
- in general, the goal of oxygen therapy is to maintain arterial oxygen saturation (\(\text{SaO}_2\)) >90%
- small decrease in saturation below \(\text{SaO}_2\) of 90% corresponds to a large drop in arterial partial pressure of oxygen (\(\text{PaO}_2\))
- in intubated patients, oxygen is delivered via the ETT
- in patients not intubated, there are many oxygen delivery systems available; the choice depends on oxygen requirements (\(\text{FiO}_2\)) and the degree to which precise control of delivery is needed
- cyanosis can be detected at \(\text{SaO}_2\) <85%, frank cyanosis at \(\text{SaO}_2\) = 67%

Low Flow Systems
- acceptable if tidal volume 300-700 mL, respiratory rate (RR) <25, consistent ventilation pattern
- provide \(O_2\) at flows between 0-10 L/min
- dilution of oxygen with room air results in a decrease in \(\text{FiO}_2\)
- an increase in minute ventilation (tidal volume x RR) results in a decrease in \(\text{FiO}_2\)
  - e.g. nasal canula (prong)
Reservoir Systems
- use a volume reservoir to accumulate oxygen during exhalation thus increasing the amount of oxygen available for the next breath
- simple face mask
  - covers patient's nose and mouth and provides an additional reservoir beyond nasopharynx
  - fed by small bore O₂ tubing at a rate of at least 6 L/min to ensure that exhaled CO₂ is flushed through the exhalation ports and not rebreathed
  - provides FiO₂ of 55% at O₂ flow rates of 10 L/min
- non-rebreather mask
  - a reservoir bag and a series of one-way valves prevent expired gases from re-entering the bag during the exhalation phase, the bag accumulates with oxygen
  - provides FiO₂ of 80% at O₂ flow rates of 10-15 L/min

High Flow Systems
- generate flows of up to 50-60 L/min
- meet/exceed patient's inspiratory flow requirement
- deliver consistent and predictable concentration of O₂
- Venturi mask
  - delivers specific FiO₂ by varying the size of air entrapment
  - oxygen concentration determined by mask's port and NOT the wall flow rate
  - enables control of gas humidity
  - FiO₂ ranges from 24-50%

Ventilation
- ventilation is maintained with PPV in patients given muscle relaxants
- assisted or controlled ventilation can also be used to assist spontaneous respirations in patients not given muscle relaxants as an artificial means of supporting ventilation and oxygenation

Mechanical Ventilation
- indications for mechanical ventilation
  - apnea
  - hypoventilation/acute respiratory acidosis
  - intraoperative positioning limiting respiratory excursion (e.g. prone, Trendelenburg)
  - required hyperventilation (to lower ICP)
  - deliver positive end expiratory pressure (PEEP)
  - increased intrathoracic pressure (e.g. laparoscopic procedure)
- complications of mechanical ventilation
  - airway complications
    - tracheal stenosis, laryngeal edema
    - alveolar complications
    - ventilator-induced lung injury, ventilator-associated pneumonia (nosocomial pneumonia), barotrauma, volutrauma, inflammation, auto-PEEP, patient-ventilator asynchrony
  - cardiovascular complications
    - reduced venous return (secondary to increased intrathoracic pressure), reduced cardiac output, hypotension
    - neuromuscular complications
    - muscle atrophy
    - increased intracranial pressure
    - metabolic
      - decreased CO₂ due to hyperventilation
      - alkalemia with over correction of chronic hypercarbia

Ventilator Strategies
- mode and settings are determined based on patient factors (e.g. ideal body weight, compliance, resistance) and underlying reason for mechanical ventilation
- hypoxemic respiratory failure: ventilator provides supplemental oxygen, recruits atelectatic lung segments, helps improve V/Q mismatch, and decreases intrapulmonary shunt
- hypercapnic respiratory failure: ventilator augments alveolar ventilation; may decrease the work of breathing, allowing respiratory muscles to rest

Composition of Air
- 78.1% nitrogen
- 20.9% oxygen
- 0.9% argon
- 0.04% carbon dioxide

Changes in peak pressures in ACV and tidal volumes in PCV may reflect changes in lung compliance and/or airway resistance – patient may be getting better or worse

Positive End Expiratory Pressure (PEEP)
- Positive pressure applied at the end of ventilation that helps to keep alveoli open, decreasing V/Q mismatch
- Used with all invasive modes of ventilation

Tracheostomy
- Tracheostomy should be considered in patients who require ventilator support for extended periods of time
- Shown to improve patient comfort and give patients a better ability to participate in rehabilitation activities

Monitoring Ventilatory Therapy
- Pulse oximetry, end-tidal CO₂ concentration
- Regular arterial blood gases
- Assess tolerance regularly

Management of pneumothorax in patients on mechanical ventilation → chest tube
Modes of Ventilation

- assist control ventilation (ACV) or volume control
  - every breath is delivered with a pre-set tidal volume and rate or minute ventilation
  - extra controlled breaths may be triggered by patient effort; if no effort is detected within a specified amount of time the ventilator will initiate the breath
- pressure control ventilation (PCV)
  - a minimum frequency is set and patient may trigger additional breaths above the ventilator
  - all breaths delivered at a preset constant inspiratory pressure
- synchronous intermittent mandatory ventilation (SIMV)
  - ventilator provides controlled breaths (either at a set volume or pressure)
  - patient can breathe spontaneously (these breaths may be pressure supported) between controlled breaths
- pressure support ventilation (PSV)
  - patient initiates all breaths and the ventilator supports each breath with a pre-set inspiratory pressure
  - useful for weaning off ventilator
- high-frequency oscillatory ventilation (HFOV)
  - high breathing rate (up to 900 breaths/min in an adult), very low tidal volumes
  - used commonly in neonatal and pediatric respiratory failure
  - used in adults when conventional mechanical ventilation is failing
- non-invasive positive pressure ventilation (NPPV)
  - achieved without intubation by using a nasal or face mask
    - BiPAP: increased pressure (like PSV) on inspiration and lower constant pressure on expiration
    - CPAP: delivers constant pressure on both inspiration and expiration

### Table 3. Causes of Abnormal End Tidal CO₂ Levels

<table>

<td>Hyperthermia and other hypermetabolic states</td>
</tr>
<tr>
<td>Decreased pulmonary blood flow (decreased cardiac output)</td>
<td>Improved pulmonary blood flow after resuscitation or hypotension</td>
</tr>
</tbody>
</table>

- Technical issues
- Incorrect placement of sampling catheter
- Inadequate sampling volume

- V/Q mismatch
  - Pulmonary thromboembolism
  - Incipient pulmonary edema
  - Air embolism

- Low bicarbonate

Intraoperative Management

**Temperature**

**Causes of Hypothermia (<36.0°C)**

- intraoperative temperature losses are common (e.g. 90% of intraoperative heat loss is transcutaneous), due to
  - OR environment (cold room, IV fluids, instruments)
  - open wound
  - prevent with inflated warming blanket and warmed IV fluids

**Causes of Hyperthermia (>37.5-38.3°C)**

- drugs (e.g. atropine)
- blood transfusion reaction
- infection/sepsis
- medical disorder (e.g. thyrotoxicosis)
- malignant hyperthermia (see Uncommon Complications, A26)
- over-zealous warming efforts
Heart Rate

Intraoperative Tachycardia
- tachycardia = HR >150 bpm; divided into narrow complex supraventricular tachycardias (SVT) or wide complex tachycardias
- SVT: sinus tachycardia, atrial fibrillation/flutter, accessory pathway mediated tachycardia, paroxysmal atrial tachycardia
- wide complex tachycardia: VT, SVT with aberrant conduction
- causes of sinus tachycardia
  - shock/hypovolemia/blood loss
  - anxiety/pain/light anesthesia
  - full bladder
  - anemia
  - febrile illness/sepsis
  - drugs (e.g. atropine, cocaine, dopamine, epinephrine, ephedrine, isoflurane, isoproterenol, pancuronium)
- Addisonian crisis, hypoglycemia, transfusion reaction, malignant hyperthermia
- for management of tachycardia, see ACLS Guidelines (Figure 17), A33

Intraoperative Bradycardia
- bradycardia = HR <50 bpm; most concerning are 2nd degree (Type 2 Mobitz) and 3rd degree heart block, which can both degenerate into asystole
- causes of sinus bradycardia
  - increased parasympathetic tone vs. decreased sympathetic tone
  - must rule out hypoxemia
  - arrhythmias (see Cardiology and Cardiac Surgery, C17)
  - baroreceptor reflex due to increased ICP or increased BP
  - vagal reflex (ocularcardiac reflex, carotid sinus reflex, airway manipulation)
  - drugs (e.g. Sch, opioids, edrophonium, neostigmine, halothane, digoxin, β-blockers)
  - high spinal/epidural anesthesia
- for management of bradycardia, see ACLS Guidelines (Figure 18), A33

Cardiac Arrest
- pulseless arrest occurs due to 4 cardiac rhythms divided into shockable and non-shockable rhythms
  - shockable: ventricular fibrillation (VF) and ventricular tachycardia (VT)
  - non-shockable: asystole and pulseless electrical activity (PEA)
- for VF/VT, key to survival is good early CPR and defibrillation
- for asystole/PEA, key to survival is good early CPR and exclude all reversible causes
- reversible causes of PEA arrest (5 Hs and 5 Ts)
  - 5 Hs: hypothermia, hypovolemia, hypoxia, hydrogen ions (acidosis), hypo/hyperkalemia
  - 5 Ts: tamponade (cardiac), thrombosis (pulmonary), thrombosis (coronary), tension pneumothorax, toxins (overdose/poisoning)
- for management of cardiac arrest, see ACLS Guidelines (Figure 16), A32

Blood Pressure

Causes of Intraoperative Hypotension/Shock
- shock: condition characterized by inability of cardiovascular system to maintain adequate end-organ perfusion and delivery of oxygen to tissues
a) hypovolemic/hemorrhagic shock
  - most common form of shock, due to decrease in intravascular volume
b) obstructive shock
  - obstruction of blood into or out of the heart
  - increased JVP, distended neck veins, increased systemic vascular resistance, insufficient cardiac output (CO)
  - e.g. tension pneumothorax, cardiac tamponade, pulmonary embolism
c) cardiogenic shock
  - myocardial dysfunction
  - SVT: sinus tachycardia, atrial fibrillation/flutter, accessory pathway mediated tachycardia, paroxysmal atrial tachycardia
  - increased JVP, distended neck veins, increased systemic vascular resistance, decreased CO
  - e.g. dysrhythmias, ischemia/infarct, cardiomyopathy, acute valvular dysfunction
d) septic shock
  - see Infectious Diseases, ID21
  - bacterial, viral, fungal, endotoxins/mediators cause vasodilation and capillary leakage
  - associated with contamination of open wounds, intestinal injury or penetrating trauma
  - signs: fever, decreased JVP, wide pulse pressure, increased CO, increased HR, decreased systemic vascular resistance ± pressors
  - initial treatment: antibiotics, volume expansion, vasopressors

BP = CO x SVR, where CO = SV x HR
SV is a function of preload, afterload, and contractility
c) spinal/neurogenic shock
   - decreased sympathetic tone
   - hypotension without tachycardia or peripheral vasoconstriction (warm skin)
f) anaphylactic shock
   - see Emergency Medicine, ER29
   - acute/subacute generalized allergic reaction due to an inappropriate or excessive immune response (type I hypersensitivity)
   - treatment of anaphylactic shock
     - moderate reaction: generalized urticaria, angioedema, wheezing, tachycardia
       - epinephrine (1:1000) 0.3-0.5 mg IM
       - antihistamines: diphenhydramine (Benadryl®) 25-50 mg IM
       - salbutamol (Ventolin®) 1 cc via MDI
     - severe reaction/evolution: severe wheezing, laryngeal/pulmonary edema, shock
       - ABCs, may need ETT due to airway edema
       - epinephrine (1:1000) 0.1-0.3 mg IV (or via ETT if no IV access) to start, repeat as needed
       - antihistamines: diphenhydramine (Benadryl®) 50 mg IV (~1 mg/kg)
       - steroids: hydrocortisone (Solucortef®) 100 mg IV (~1.5 mg/kg) or methylprednisolone (Solumedrol®) 1 mg/kg IV q6h x 24 h
       - large volumes of crystalloid may be required
g) drugs
   - vasodilators, high spinal anesthetic interfering with sympathetic outflow
h) other
   - transfusion reaction, Addisonian crisis, thyrotoxicosis, hypothyroid, aortocaval syndrome
   - see Hematology, H54 and Endocrinology, E34, E22, E26

Causes of Intraoperative Hypertension
- inadequate anesthesia causing pain and anxiety
- pre-existing HTN, coarctation, or preeclampsia
- hypoxemia/hypercarbia
- hypervolemia
- increased intracranial pressure
- full bladder
- drugs (e.g. ephedrine, epinephrine, cocaine, phenylephrine, ketamine)
- allergic/anaphylactic reaction
- hypermetabolic states: malignant hyperthermia, neuroleptic malignant syndrome, serotonin syndrome (see Psychiatry, PS46), thyroid storm, pheochromocytoma (see Endocrinology, E25, E35)

Fluid Balance and Resuscitation
- total requirement = maintenance + deficit + ongoing loss
- in surgical settings this formula must take into account multiple factors including pre-operative fasting/decreased fluid intake, increased losses during or before surgery, fluid shifting during surgery, fluids given with blood products and medications

What is the Maintenance?
- average healthy adult requires approximately 2500 mL water/d
  - 200 mL/d GI losses
  - 800 mL/d insensible losses (respiration, perspiration)
  - 1500 mL/d urine (be aware of renal failure)
- 4:2:1 rule to calculate maintenance requirements (applies to crystalloids only)
  - 4 mL/kg/h first 10 kg
  - 2 mL/kg/h second 10 kg
  - 1 mL/kg/h for remaining weight >20 kg
- increased requirements with fever, sweating, GI losses (vomiting, diarrhea, NG suction), adrenal insufficiency, hyperventilation, and polyuric renal disease
- decreased requirements with anuria/oliguria, SIADH, highly humidified atmospheres, and CHF
- maintenance electrolytes
  - Na⁺: 3 mEq/kg/d
  - K⁺: 1 mEq/kg/d
- 50 kg patient maintenance requirements
  - fluid = 40 + 20 + 30 = 90 mL/h = 2160 mL/d = 2.16 L/d
  - Na⁺ = 150 mEq/d (therefore 150 mEq / 2.16 L/d = 69 mEq/L)
  - K⁺ = 50 mEq/d (therefore 50 mEq / 2.16 L/d = 23 mEq/L)
- above patient's requirements roughly met with 2/3 D5W, 1/3 NS
  - 2/3 + 1/3 at 100 mL/h with 20 mEq KCl per litre
What is the Deficit?

- patients should be adequately hydrated prior to anesthesia
- total body water (TBW) = 60% or 50% of total body weight for an adult male or female, respectively (e.g. for a 70 kg adult male TBW = 70 x 0.6 = 42 L)
- total Na⁺ content determines ECF volume; [Na⁺] determines ICF volume
- hypovolemia due to volume contraction
  - extra-renal Na⁺ loss
    - GI: vomiting, NG suction, drainage, fistulae, diarrhea
    - skin/resp: insensible losses (fever), sweating, burns
    - vascular: hemorrhage
  - renal Na⁺ and H₂O loss
    - diuretics
    - osmotic diuresis
    - hypoadosteronism
    - salt-wasting nephropathies
  - renal H₂O loss
    - diabetes insipidus (central or nephrogenic)
  - hypovolemia with normal or expanded ECF volume
  - decreased CO
  - redistribution
    - hypoalbuminemia: cirrhosis, nephrotic syndrome
    - capillary leakage: acute pancreatitis, rhabdomyolysis, ischemic bowel, sepsis, anaphylaxis
- replace water and electrolytes as determined by patient’s needs
- with chronic hyponatremia, correction must be done gradually over >48 h to avoid central pontine myelinolysis

Table 4. Signs and Symptoms of Dehydration

<table>

</tr>
</tbody>
</table>

What are the Ongoing Losses?

- losses from Foley catheter, NG, surgical drains
- third-spacing (other than ECF, ICF)
  - pleura, GI, retroperitoneal, peritoneal
  - evaporation via exposed viscera, burns
- blood loss
- ongoing loss due to surgical exposure and evaporative losses

IV Fluids

- replacement fluids include crystalloid and colloid solutions
- IV fluids improve perfusion but NOT O₂ carrying capacity of blood

Initial Distribution of IV Fluids

- H₂O follows ions/molecules to their respective compartments

Crystalloid Infusion

- salt-containing solutions that distribute only within ECF
- maintain euvolemia in patient with blood loss: 3 mL crystalloid infusion per 1 mL of blood loss for volume replacement (i.e. 3:1 replacement)
- if large volumes are to be given, use balanced fluids such as Ringer’s lactate or Plasmalyte®, as too much normal saline (NS) may lead to hyperchloremic metabolic acidosis

Colloid Infusion (see Blood Products, A15)

- includes protein colloids (albumin and gelatin solutions) and non-protein colloids (dextrans and starches e.g. hydroxyethyl starch [HES])
- distributes within intravascular volume
- 1:1 ratio (infusion:blood loss) only in terms of replacing intravascular volume
- HES colloids remain in intravascular space (metabolized by plasma serum amylase and renally excreted); two available in Canada: Voluven® and Pentaspan®

Colloids vs. Crystalloids for Fluid Resuscitation in Critically Ill Patients

Cochrane Database System Rev 2012;6:CD000567

Purpose: To evaluate the effects of colloids compared to crystalloids for fluid resuscitation, specifically when used in critically ill patients.

Methods: A meta-analysis was performed looking at randomized controlled trials comparing colloid vs. crystalloid use in patients requiring volume replacement. Pregnant women and neonates were excluded. Primary outcome was overall mortality.

Results: Results were broken down based on specific colloid. For albumin (or plasma protein fraction) the relative risk (RR) was 1.01 (95% CI 0.93-1.10) as compared to crystalloid. For hydroxyethyl starch the RR was 1.10 (95% CI 0.91-1.32). Modified gelatin had a RR of 0.91 (95% CI 0.49-1.72) and Dextran had a RR of 1.24 (95% CI 0.94-1.65). For colloids mixed in a hypertonic crystalloid as compared to isotonic crystalloid the RR was 0.88 (95% CI 0.71-1.08).

Conclusions: There is no evidence that use of colloids improves survival in trauma patients, burn patients, or post-operative patients when compared to crystalloid solutions. Given the increased cost of colloids as compared to crystalloids, it is recommended that crystalloids be the fluid of choice in these patients.
• the use of HES solutions is controversial because of recent RCTs and meta-analyses highlighting their renal (especially in septic patients) and coagulopathic side effects, as well as a lack of specific indications for their use
  ▪ colloids are being used based on mechanistic and experimental evidence but there is a paucity of definitive studies investigating their safety and efficacy; routine use of colloids should be avoided

Blood Products

• see Hematology, H52

Red Blood Cells (RBCs)

1 U RBCs (approx. 300 ml) increases Hb by approximately 10 g/L in a 70 kg patient
RBCs may be diluted with colloidal/crystalloid to decrease viscosity
decision to transfuse based on initial blood volume, premorbid Hb level, present volume status, expected further blood loss, patient health status, patient consent
massive transfusion ≥1 x blood volume/24 h

Autologous RBCs

replacement of blood volume with one’s own RBCs
may decrease complications (infectious, febrile, etc.)
alternative to homologous transfusion in elective procedures, but only if adequate Hb and no infection
pre-operative phlebotomy prior to elective surgery (up to 3U collected 3-5 wk before surgery)
intraoperative salvage and filtration (cell saver); contraindicated in contaminated (e.g. bowel, abscess) or cancer cases

Non-RBC Products

• fresh frozen plasma (FFP)
  ▪ contains all plasma clotting factors and fibrinogen close to normal plasma levels
to prevent/treat bleeding due to coagulation factor depletion/deficiencies, liver impairment
cryoprecipitate
  ▪ contains Factors VIII and XIII, von Willebrand Factor (vWF), fibrinogen
platelets
  ▪ used in thrombocytopenia, massive transfusions, impaired platelet function
albumin
  ▪ selective intravascular volume expander
erthropoietin
  ▪ can be used pre-operatively to stimulate erythropoiesis

Complications Due to Transfusion

• infectious risks: HIV, hepatitis B/C, Epstein-Barr virus (EBV), cytomegalovirus (CMV), brucellosis, malaria, salmonellosis, measles, syphilis
• hypervolemia
electrolyte changes: increased K⁺ in stored blood
dilutional coagulopathy

Transfusion and risk of infection in Canada: Update 2012, Paediatr Child Health 2012;17:e102-e111
• dilutional thrombocytopenia
• hypothermia
• citrate toxicity
• hypocalcemia
• iron overload
• transfusion-related immunosuppression: perioperative transfusion may be associated with increased risk of post-operative infection, increased short-term mortality and possible cancer recurrence
• see Hematology, H54 for list of transfusion reactions

Induction

Routine Induction vs. Rapid Sequence Induction

- routine induction is the standard in general anesthesia, however a RSI is indicated in patients at risk of regurgitation/aspiration (see Aspiration, A5)
- RSI uses pre-determined doses of induction drugs given in rapid succession to minimize time patient is at risk for aspiration

Table 7. Comparison of Routine Induction vs. RSI

</tbody>
</table>

Induction Agents

- induction in general anesthesia may be achieved with intravenous agents, volatile inhalation agents, or both

Intravenous Agents

- see Table 10, A27
- IV induction agents are non-opioid drugs used to provide hypnosis, amnesia and blunt reflexes
- these are initially used to draw the patient into the maintenance phase of general anesthesia rapidly, smoothly and with little adverse effects
- examples include propofol, sodium thiopental (not available in North America), or ketamine
- a continuous propofol infusion may also be used for the maintenance phase of GA

Solubility of Volatile Anesthetics in Blood

Least Soluble to Most Soluble

Nitrous oxide < desflurane < sevoflurane < isoflurane < halothane
Volatile Inhalational Agents
- examples include sevoflurane, desflurane, isoflurane, enflurane, halothane, and nitrous oxide
- see Table 13, A28

MAC (Minimum Alveolar Concentration)
- the alveolar concentration of a volatile anesthetic at one atmosphere (atm) of pressure that will prevent movement in 50% of patients in response to a surgical stimulus (e.g. abdominal incision)
- 1.2-1.3 times MAC will often ablate response to stimuli in the general population
- potency of inhalational agents is compared using MAC
- MAC values are roughly additive when mixing N₂O with another volatile agent; however, this only applies to movement, not other effects such as BP changes (e.g. 0.5 MAC of a potent agent + 0.5 MAC of N₂O = 1 MAC of potent agent)
- MAC-intubation: the MAC of anesthetic that will inhibit movement and coughing during endotracheal intubation, generally 1.3 MAC
- MAC-block adrenergic response (MAC-BAR): the MAC necessary to blunt the sympathetic response to noxious stimuli, generally 1.5 MAC
- MAC-awake: the MAC of a given volatile anesthetic at which a patient will open their eyes to command, usually 0.3-0.4 of the usual MAC value

Muscle Relaxants and Reversing Agents
- two types of muscle relaxants
  1. depolarizing muscle relaxants: succinylcholine (SCh)
  2. non-depolarizing muscle relaxants: rocuronium, mivacurium, vecuronium, cistracurium, pancuronium
- see Tables 14 and 15, A29 for more details including mechanism of action
- block nicotinic cholinergic receptors in NMJ
- provides skeletal muscle paralysis, including the diaphragm, but spares involuntary muscles such as the heart and smooth muscle
- never use muscle relaxants without adequate preparation and equipment to maintain airway and ventilation
- muscle relaxation produces the following desired effects
  1. facilitates intubation
  2. assists with mechanical ventilation
  3. prevents muscle stretch reflex and decreases muscle tone
  4. allows access to the surgical field (intracavitary surgery)
- nerve stimulator (i.e. train of four) is used intraoperatively to assess the degree of nerve block; no twitch response seen with complete neuromuscular blockade
Reversing Agents
- neostigmine, pyridostigmine, edrophonium (see Table 16, A30)
- reversal agents are acetylcholinesterase inhibitors
  - inhibits enzymatic degradation of ACh; increases amount of ACh at nicotinic and muscarinic receptors, displacing non-depolarizing muscle relaxant
  - administer reversal agents when there has been some recovery of blockade (i.e. muscle twitch)
  - can only reverse the effect of non-depolarizing muscle relaxants
- anticholinergic agents (e.g. atropine, glycopyrrolate) are simultaneously administered to minimize muscarinic effect of reversal agents (i.e. bradycardia, salivation and increased bowel peristalsis)

Analgesia
- options include opioids (e.g. morphine, fentanyl, hydromorphone), NSAIDS, acetaminophen, ketamine, gabapentin, local, and regional anesthetic (see Table 11, A28)

Maintenance
- general anesthesia is maintained using volatile inhalation agents and/or IV agents (i.e. propofol infusion)
- analgesia (usually IV opioids) and muscle relaxants are also given as needed

Extubation
- criteria
  - patient must no longer have intubation requirements (see Table 2, A7)
  - patency: airway must be patent
  - protection: airway reflexes intact
  - patient must be oxygenating and ventilating spontaneously
- general guidelines
  - ensure patient has normal neuromuscular function (peripheral nerve stimulator monitoring) and hemodynamic status
  - ensure patient is breathing spontaneously with adequate rate and tidal volume
  - allow ventilation (spontaneous or controlled) with 100% O₂ for 3-5 min
  - suction secretions from pharynx
  - deflate cuff, remove ETT on inspiration (vocal cords abducted)
  - ensure patient is breathing adequately after extubation
  - ensure face mask for O₂ delivery available
  - proper positioning of patient during transfer to recovery room (supine, head elevated)

Complications of Extubation
- early extubation: aspiration, laryngospasm
- late extubation: transient vocal cord incompetence, edema (glottic, subglottic), pharyngitis, tracheitis

Laryngospasm
- defined as forceful involuntary spasm of laryngeal muscles caused by stimulation of superior laryngeal nerve (by oropharyngeal secretions, blood, extubation)
- causes partial or total airway obstruction
- more likely to occur in semi-conscious patients
- prevention: extubate while patient is still deeply under anesthesia or fully awake
- treatment: apply sustained positive pressure with bag-mask ventilation with 100% oxygen, low-dose propofol (0.5-1.0 mg/kg) optional, low-dose succinylcholine (approximately 0.25 mg/kg) and reintubation if hypoxia develops
Regional Anesthesia

- local anesthetic agent (LA) applied around a peripheral nerve at any point along the length of the nerve (from spinal cord up to, but not including, the nerve endings) for the purpose of reducing or preventing impulse transmission
- no CNS depression (unless overdose of local anesthetic); patient remains conscious
- regional anesthetic techniques categorized as follows:
  - epidural and spinal anesthesia (neuraxial anesthesia)
  - peripheral nerve blocks
  - IV regional anesthesia (e.g. Bier block)

Patient Preparation
- sedation may be indicated before block
- monitoring should be as extensive as for general anesthesia

Relative Indications for Regional Anesthesia
- patient preference
- superior post-operative analgesia
- decreased incidence of PONV
- shorter recovery and improved rehabilitation
- general anesthesia not available/contraindicated
- differential blockade (to block pain but preserve motor function)

Complications of Regional Anesthesia
- failure of technique/inadequate anesthesia
- unintentional total spinal anesthesia
- systemic drug toxicity due to overdose or intravascular injection (see Local Anesthesia, A21)
- injury to nerve root/spinal cord (nerve deficit), epidural vein (hematoma), peripheral nerve (intraneural injection)
- infection (e.g. osteitis, epidural abscess, meningitis)

Epidural and Spinal Anesthesia

- most useful for surgeries performed below level of umbilicus

Anatomy of Spinal/Epidural Area
- spinal cord extends to L2, dural sac to S2 in adults
- nerve roots (cauda equina) from L2 to S2
- needle inserted below L2 should not encounter cord, thus L3-L4, L4-L5 interspace commonly used
- structures penetrated
  - skin
  - subcutaneous fat
  - supraspinous ligament
  - interspinous ligament
  - ligamentum flavum (last layer before epidural space)
  - dura + arachnoid for spinal anesthesia

Table 8. Epidural vs. Spinal Anesthesia

<td><strong>Onset</strong></td>
<td>Significant blockade requires 10-15 min Slower onset of side effects</td>
<td>Rapid blockade (onset in 2-5 min)</td>
</tr>
<tr>
<td><strong>Effectiveness</strong></td>
<td>Effectiveness of blockade can be variable</td>
<td>Very effective blockade</td>
</tr>
<tr>
<td><strong>Difficulty</strong></td>
<td>Technically more difficult; greater failure rate</td>
<td>Easier to perform due to visual confirmation of CSF flow</td>
</tr>
<tr>
<td><strong>Patient Positioning</strong></td>
<td>Position of patient not as important; specific gravity not an issue</td>
<td>Hyperbaric LA solution – position of patient important</td>
</tr>
</tbody>
</table>

Benefits of Regional Anesthesia
- Reduced perioperative pulmonary complications
- Reduced perioperative analgesia requirements
- Decreased PONV
- Ability to monitor CNS status during procedure
- Improved perfusion
- Lower incidence of VTE

Landmarking Epidural/Spinal Anesthesia
- Spinal processes should be maximally flexed
- L4 spinal processes found between iliac crests
- Common sites of insertion are L3-L4 and L4-L5

Classic Presentation of Dural Puncture Headache
- Onset 6 h-3 d after dural puncture
- Postural component (worse sitting)
- Occipital or frontal localization
- ± tinnitus, diplopia

</table>

- **Complications**
  - Failure of technique
  - Hypotension
  - Bradycardia if cardiac sympathetics blocked (only if ~T2-4 block), e.g. "high spinal"
  - Epidural or subarachnoid hematoma
  - Accidental subarachnoid injection can produce spinal anesthesia (and any of the above complications)
  - Systemic toxicity of LA (accidental intravenous)
  - Catheter complications (shearing, kinking, vascular or subarachnoid placement)
  - Infection
  - Dural puncture

- **Combined Spinal-Epidural**
  - Combines the benefits of rapid, reliable, intense blockade of spinal anesthesia together with the flexibility of an epidural catheter

**Contraindications to Spinal/Epidural Anesthesia**
- **absolute contraindications**
  - Lack of trained personnel
  - Lack of resuscitative drugs/equipment
  - Patient refusal
  - Allergy to local anesthetic
  - Infection at puncture site or underlying tissues
  - Coagulopathies/bleeding diathesis
  - Raised ICP
  - Sepsis/bacteremia
  - Severe hypovolemia
  - Cardiac lesion with fixed output states (severe mitral/aortic stenosis)
  - Lack of IV access
- **relative contraindications**
  - Pre-existing neurological disease (demyelinating lesions)
  - Previous spinal surgery, severe spinal deformity
  - Prolonged surgery
  - Major blood loss or maneuvers that can compromise reaction

**Peripheral Nerve Blocks**
- Deposition of LA around the target nerve or plexus
- Ultrasound guidance and peripheral nerve stimulation (needle will stimulate target nerve/plexus) may be used to guide needle to target nerve while avoiding neural trauma or intraneurale injection
- Approximately 2-4 per 10,000 risk of late neurologic injury
- Most major nerves or nerve plexi can be targeted (brachial plexus block, femoral nerve block, sciatic nerve block, etc.)
- Performed with standard monitors
- Resuscitation equipment must be available

**Contraindications to Peripheral Nerve Blockade**
- **Absolute contraindications**
  - Allergy to LA
  - Patient refusal
- **Relative contraindications**
  - Certain types of pre-existing neurological dysfunction (e.g. ALS, MS, diabetic neuropathy)
  - Local infection at block site
  - Bleeding disorder

---

**Figure 9. Landmarks for placement of epidural/spinal**

**Reduction of Post-Operative Mortality**

- **Purpose**: To obtain reliable estimates of the effects of neuraxial blockade with epidural or spinal anesthesia on post-operative morbidity and mortality after various surgeries with or without general anesthesia.
- **Study**: Systematic review of all trials with randomization to intraoperative neuraxial blockade vs. control group.
- **Patients**: 141 trials including 9,569 patients.
- **Main Outcomes**: All cause mortality, MI, PE, DVT, transfusion requirements, pneumonia, other infections, respiratory depression, and renal failure.
- **Results**: With neuraxial blockade, overall mortality was reduced by about one third. Neuraxial blockade reduced the risk of PE by 55%, DVT by 44%, transfusion requirements by 50%, pneumonia by 39%, and respiratory depression by 59%. There were also reductions in MI and renal failure. These mortality reductions are irrespective of surgical group, type of blockade (epidural or spinal), or whether neuraxial blockade was combined with general anesthesia.
- **Conclusions**: Neuraxial blockade reduces post-operative mortality and other serious complications.
Local Anesthesia

Local Anesthetic Agents

- see Table 17, A29 for list of LA agents

Definition and Mode of Action
- LA are drugs that block the generation and propagation of impulses in excitable tissues: nerves, skeletal muscle, cardiac muscle, brain
- LA bind to receptors on the cytosolic side of the Na⁺ channel, inhibiting Na⁺ flux and thus blocking impulse conduction
- different types of nerve fibres undergo blockade at different rates

Absorption, Distribution, Metabolism
- LA readily crosses the blood-brain barrier (BBB) once absorbed into the bloodstream
- ester-type LA (procaine, tetracaine) are broken down by plasma and hepatic esterases; metabolites excreted via kidneys
- amide-type LA (lidocaine, bupivicaine) are broken down by hepatic mixed-function oxidases (P450 system); metabolites excreted via kidneys

Selection of LA
- choice of LA depends on
  ▪ onset of action: influenced by pKa (the lower the pKa, the higher the concentration of the base form of the LA, and the faster the onset of action)
  ▪ duration of desired effects: influenced by protein binding (longer duration of action when protein binding of LA is strong)
  ▪ potency: influenced by lipid solubility (agents with high lipid solubility penetrate the nerve membrane more easily)
  ▪ unique needs (e.g. sensory blockade with relative preservation of motor function by bupivicaine at low doses)
  ▪ potential for toxicity

Systemic Toxicity

- see Table 17, A29 for maximum doses, potency, and duration of action for common LA agents
- occurs by accidental intravascular injection, LA overdose, or unexpectedly rapid absorption
- CNS effects
  ▪ CNS effects first appear to be excitatory due to initial block of inhibitory fibres, then subsequent block of excitatory fibres
  ▪ effects in order of appearance
    ▪ numbness of tongue, perioral tingling, metallic taste
    ▪ disorientation, drowsiness
    ▪ tinnitus
    ▪ visual disturbances
    ▪ muscle twitching, tremors
    ▪ unconsciousness
    ▪ convulsions, seizures
    ▪ generalized CNS depression, coma, respiratory arrest
- CVS effects
  ▪ vasodilation, hypotension
  ▪ decreased myocardial contractility
  ▪ dose-dependent delay in cardiac impulse transmission
    ▪ prolonged PR, QRS intervals
    ▪ sinus bradycardia
  ▪ CVS collapse
- treatment of systemic toxicity
  ▪ early recognition of signs, get help
  ▪ 100% O₂, manage ABCs
  ▪ diazepam or sodium thiopental may be used to increase seizure threshold
  ▪ manage arrhythmias (see ACLS Guidelines, A32)
  ▪ Intralipid* 20% to bind local anesthetic in circulation

Figure 10. Local anesthetic systemic toxicity
Local Infiltration and Hematoma Blocks

Local Infiltration
- injection of tissue with LA, producing a lack of sensation in the infiltrated area due to LA acting on nerves
- suitable for small incisions, suturing, excising small lesions
- can use fairly large volumes of dilute LA to infiltrate a large area
- low concentrations of epinephrine (1:100,000–1:200,000) cause vasoconstriction, thus reducing bleeding and prolonging the effects of LA by reducing systemic absorption

Fracture Hematoma Block
- special type of local infiltration for pain control during manipulation of certain fractures
- hematoma created by fracture is infiltrated with LA to anesthetize surrounding tissues
- sensory blockade may only be partial
- no muscle relaxation

Topical Anesthetics
- various preparations of local anesthetics available for topical use, may be a mixture of agents (EMLA cream is a combination of 2.5% lidocaine and prilocaine)
- must be able to penetrate the skin or mucous membrane

Post-Operative Care
- pain management should be continuous from OR to post-anesthetic care unit (PACU) to hospital ward and home

Common Post-Operative Anesthetic Complications

Nausea and Vomiting
- hypotension and bradycardia must be ruled out
- pain and surgical manipulation also cause nausea
- often treated with dimenhydrinate (Gravol®), metoclopramide (Maxeran®; not with bowel obstruction), prochlorperazine (Stemetil®), ondansetron (Zofran®), granisetron (Kytril®)
- metabolic disturbance (hypoglycemia, hypercalcemia, hyponatremia – especially post-TURP)
- drug effect (ketamine, anticholinergics, serotonin)
- elderly patients are more susceptible to post-operative delirium

Confusion and Agitation
- ABCs first – confusion or agitation can be caused by airway obstruction, hypercapnea, hypoxemia
- neurologic status (Glasgow Coma Scale, pupils), residual paralysis from anesthetic
- fear/anxiety/separation from caregivers, language barriers
- reduced cardiac output (hypovolemia, most common cause) and/or peripheral vasodilation
- drug effect (ketamine, anticholinergics, serotonin)
- elderly patients are more susceptible to post-operative delirium

Respiratory Complications
- susceptible to aspiration of gastric contents due to PONV and unreliable airway reflexes
- airway obstruction (secondary to reduced muscle tone from residual anesthetic, soft tissue trauma and edema, or pooled secretions) may lead to inadequate ventilation, hypoxemia, and hypercapnia
- airway obstruction can often be relieved with head tilt, jaw elevation, and anterior displacement of the mandible. If the obstruction is not reversible, a nasal or oral airway may be used

Hypotension
- must be identified and treated quickly to prevent inadequate perfusion and ischemic damage
- reduced cardiac output (hypovolemia, most common cause) and/or peripheral vasodilation (residual anesthetic agent)
- first step in treatment is usually the administration of fluids ± inotropic agents

Hypertension
- pain, hypercapnia, hypoxemia, increased intravascular fluid volume, and sympathomimetic drugs can cause hypertension
- sodium nitroprusside or β-blocking drugs (e.g. esmolol and metoprolol) can be used to treat hypertension

Where Not to Use LA with Epinephrine
“Ears, Fingers, Toes, Penis, Nose”

Risk Factors for Post-Operative Nausea and Vomiting (PONV)
- Young age
- Female
- History of PONV
- Non-smoker
- Type of surgery: ophtho, ENT, abdo/pelvic, plastics
- Type of anesthetic: N2O, opioids, volatile agents

Drugs for Preventing Post-Operative Nausea and Vomiting
Cochrane DB Syst Rev 2006;3:CD004125
Purpose: To evaluate the efficacy of antiemetics in preventing PONV
Methods: A meta-analysis was performed looking at randomized controlled trials comparing an antiemetic to either a second antiemetic or placebo. Trials looking at dosing and/or timing of medication administration were also included. PONV was used as the primary outcome.
Results: 737 studies involving 103,237 patients. Eight drugs significantly reduced the occurrence of PONV, namely: droperidol, metoclopramide, ondansetron, tropisetron, dolasetron, dexamethasone, cyclizine, and granisetron. Relative risk (RR) versus placebo varied between 0.67 and 0.80. Side effects included a significant increase in drowsiness for droperidol (RR 1.32) and headache for ondansetron (RR 1.16). The cumulative number needed to treat was 3.5.
Conclusion: Antiemetic medication is effective for reducing the occurrence of PONV. However, further investigation needs to be done to determine whether antiemetics can cause more severe (and likely rare) side effects, which could alter how liberally they are used.
## Pain Management

### Definitions
- **pain**: perception of nociception, which occurs in the brain
- **nociception**: detection, transduction, and transmission of noxious stimuli

### Pain Classifications
- **temporal**: acute vs. chronic
- **mechanism**: nociceptive vs. neuropathic

### Acute Pain
- pain of short duration (<6 wk) usually associated with surgery, trauma, or acute illness; often associated with inflammation
- usually limited to the area of damage/trauma and resolves with healing

## Pharmacological Management of Acute Pain
- ask the patient to rate the pain out of 10, or use visual analog scale, to determine severity
- pharmacological treatment guided by WHO analgesia ladder
- patient controlled analgesia (PCA)
  - involves the use of computerized pumps that can deliver a constant infusion as well as bolus breakthrough doses of parenterally-administered opioid analgesics
  - limited by lockout intervals
  - most commonly used agents: morphine and hydromorphone
  - see Table 12, A28 for suggested infusion rate, PCA dose and lockout intervals

- **Cautionary Use of NSAIDs in Patients with**
  - Asthma
  - Coagulopathy
  - G.I ulcers
  - Renal insufficiency
  - Pregnancy, 3rd trimester

- **Common Side Effects of Opioids**
  - N/V
  - Constipation
  - Sedation
  - Pruritus
  - Abdominal pain
  - Urinary retention
  - Respiratory depression

- When prescribing opioids, consider:
  - Breakthrough dose
  - Anti-emetics
  - Laxative

### PCA Parameters
- **Loading dose**
- **Bolus dose**
- **Lockout interval**
- **Continuous infusion (optional)**
- **Maximum 4 h dose (limit)**

- **Advantages of PCA**
  - Improved patient satisfaction
  - Fewer side effects
  - Accomodates patient variability
  - Accomodiates changes in opioid requirements

Opioid Antagonists (naloxone, naltrexone)
- Indication: opioid overdose (manifests primarily at CNS, e.g. respiratory depression)
- Mechanism of action: competitively inhibit opioid receptors, predominantly μ receptors
  - Naloxone is short-acting (t1/2 = 1 h); effects of narcotic may return when naloxone wears off; therefore, the patient must be observed closely following its administration
  - Naltrexone is longer-acting (t1/2 = 10 h); less likely to see return of opioid effects
- Side effects: relative overdose of naloxone may cause nausea, agitation, sweating, tachycardia, hypertension, re-emergence of pain, pulmonary edema, seizures (essentially opioid withdrawal)
  - Resistant to allodynia (pain in response to normally painless stimuli) or hyperalgesia (increased sensitivity to painful stimuli)
  - Consider adding anticonvulsants (gabapentin, pregabalin) or low-dose tricyclic antidepressant as combination, these lead to an increased risk of aspiration – therefore for surgery, a pregnant patient is given sodium citrate 30 cc PO immediately before surgery to neutralize gastric acidity
  - Patient is positioned in left uterine displacement using a wedge under her right flank
  - Cesarean delivery
  - Breastfeeding difficulties, long-term back pain, or long-term urinary incontinence.

Neuropathic Pain
- Pain caused by peripheral or central nervous system injury, often described as burning, lancinating, shooting, or tingling
- Nociceptive and neuropathic components; dysregulation of analgesic pathways
- In the peripartum period, consider continuing regular long-acting analgesics and augmenting with regional techniques, adjuvants, additional opioid analgesia and non-pharmacological techniques

Obstetric Anesthesia

Physiologic Changes in Pregnancy
- Airway
  - Possible difficult airway as tissues becomes edematous and friable especially in labour
- Respiratory
  - Decreased FRC and increased O2 consumption → desaturation occurs more quickly during apnea
- Cardiovascular system
  - Increased blood volume > increased RBC mass → mild anemia
  - Decreased SVR proportionately greater than increased CO → decreased BP
- Prone to decreased BP due to aortocaval compression – therefore for surgery, a pregnant patient is positioned in left uterine displacement using a wedge under her right flank
- Central nervous system
  - Decreased MAC due to hormonal effects
  - Increased block height due to engorged epidural veins
- Gastrointestinal system
  - Delayed gastric emptying
  - Increased volume and acidity of gastric fluid
  - Decreased LES tone
  - Increased abdominal pressure

Combined, these lead to an increased risk of aspiration – therefore for surgery, a pregnant patient is given sodium citrate 30 cc PO immediately before surgery to neutralize gastric acidity
Options for Analgesia during Labour
- psychoprophylaxis – Lamaze method
  - patterns of breathing and focused attention on fixed object
- systemic medication
  - easy to administer, but risk of maternal or neonatal depression
  - opioids most commonly used if delivery is not expected within 4 h
- inhalational analgesia
  - easy to administer, makes uterine contractions more tolerable, but does not relieve pain completely
  - 50% nitrous oxide
- neuraxial anesthesia
  - provides excellent analgesia with minimal depressant effects
  - hypotension is the most common complication
  - maternal BP monitored q2-5 min for 15-20 min after initiation and regularly thereafter
  - epidural usually given as it preferentially blocks sensation, leaving motor function intact

Options for Caesarean Section
- neuraxial: spinal or epidural
- general: used if contraindications or time precludes regional blockade

Pediatric Anesthesia

Respiratory System
- in comparison to adults, anatomical differences in infants include:
  - large head, short trachea/neck, large tongue, adenoids, and tonsils
  - narrow nasal passages (obligate nasal breathers until 5 mo)
  - narrowest part of airway at the level of the cricoid vs. glottis in adults
  - epiglottis is longer, U shaped and angled at 45°; carina is wider and is at the level of T2 (T4 in adults)
- physiologic differences include
  - faster RR, immature respiratory centres which are depressed by hypoxia/hypercapnea (airway closure occurs in the neonate at the end of expiration)
  - less oxygen reserve during apnea – decreased total lung volume, vital and functional reserve capacity together with higher metabolic needs
  - greater V/Q mismatch – lower lung compliance due to immature alveoli (mature at 8 yr)
  - greater work of breathing – greater chest wall compliance, weaker intercostals/diaphragm, and higher resistance to airflow

Cardiovascular System
- blood volume at birth is approximately 80 mL/kg; transfusion should be started if >10% of blood volume lost
- children have a high HR and low BP
- CO is dependent on HR, not stroke volume because of low heart wall compliance; therefore, bradycardia → severe compromise in CO

Temperature Regulation
- vulnerable to hypothermia
- minimize heat loss by use of warming blankets, covering the infant’s head, humidification of inspired gases, and warming of infused solutions

Central Nervous System
- MAC of halothane is increased compared to the adult (0.75% adult, 1.2% infant, 0.87% neonate)
- NMJ is immature for the first 4 wk of life and thus there is an increased sensitivity to non-depolarizing relaxants
- parasymptethetics mature at birth, sympthetics mature at 4-6 mo → autonomic imbalance
- infant brain is 12% of body weight and receives 34% of CO (adult: 2% body weight and 14% CO)

Glucose Maintenance
- infants less than 1 yr old can become seriously hypoglycemic during pre-operative fasting and post-operatively if feeding is not recommened as soon as possible
- after 1 yr, children are able to maintain normal glucose homeostasis in excess of 8 h

Pharmacology
- higher dose requirements because of higher TBW (75% vs. 60% in adults) and greater volume of distribution
- barbiturates/opioids more potent due to greater permeability of BBB
Uncommon Complications

Malignant Hyperthermia

- hypermetabolic disorder of skeletal muscle
- due to an uncontrolled increase in intracellular Ca\(^{2+}\) (because of an anomaly of the ryanodine receptor which regulates the Ca\(^{2+}\) channel in the sarcoplasmic reticulum of skeletal muscle)
- autosomal dominant inheritance
- incidence of 1-5 in 100,000, may be associated with skeletal muscle abnormalities such as dystrophy or myopathy
- anesthetic drugs triggering MH include
  - all inhalational agents except nitrous oxide
  - depolarizing muscle relaxants: SCh

Clinical Picture

- onset: immediate or hours after contact with trigger agent
  - increased oxygen consumption
  - increased ET\(_{CO_2}\) on capnograph
  - tachycardia/dysrhythmia
  - tachypnea/cyanosis
  - diaphoresis
  - hypertension
  - increased temperature (late sign)
- muscular symptoms
  - trismus (masseter spasm) common but not specific for MH (occurs in 1% of children given SCh with halothane anesthesia)
  - tender, swollen muscles due to rhabdomyolysis
  - trunk or total body rigidity

Complications

- coma
- DIC
- rhabdomyolysis
- myoglobinuric renal failure/hepatic dysfunction
- electrolyte abnormalities (e.g. hyperkalemia) and secondary arrhythmias
- ARDS
- pulmonary edema
- can be fatal if untreated

Prevention

- suspect MH in patients with a family history of problems/death with anesthetic
- avoid all trigger medications, use vapour free equipment, use regional anesthesia if possible
- central body temp and ET\(_{CO_2}\) monitoring

Malignant Hyperthermia Management (Based on Malignant Hyperthermia Association of the U.S. [MHAUS] Guidelines, 2008)

1. notify surgeon, discontinue volatile agents and succinylcholine, hyperventilate with 100% oxygen at flows of 10 L/min or more, halt the procedure as soon as possible
2. dantrolene 2.5 mg/kg IV, through large-bore IV if possible
   - repeat until there is control of signs of MH; sometimes up to 30 mg/kg is necessary
3. bicarbonate 1-2 mEq/kg if blood gas values are not available for metabolic acidosis
4. cool patients with core temperature >39°C
   - lavage open body cavities, stomach, bladder, rectum; apply ice to surface; infuse cold saline IV
   - stop cooling if temperature is <38°C to prevent drift to <36°C
5. dysrhythmias usually respond to treatment of acidosis and hyperkalemia
   - use standard drug therapy except Ca\(^{2+}\) channel blockers as they may cause hyperkalemia and cardiac arrest in presence of dantrolene

ET T Sizing in Pediatrics

<table>
<thead>
<tr>
<th>Diameter (mm) of tracheal tube in children after 1 year</th>
<th>= (age/4) + 4</th>

<tbody>
<tr>
<td>Length (cm) of tracheal tube</td>
<td>= (age/2) + 12</td>
</tr>
</tbody>
</table>

Basic Principles of MH Management

"Some Hot Dude Better Get Iced Fluids Fast"

Stop all triggering agents, give 100% \(O_2\)
Hyperventilate
Dantrolene 2.5 mg/kg every 5 min
Bicarbonate
Glucose and insulin
IV fluids; cool patient to 38°C
Fluid output; consider furosemide
Tachycardia: be prepared to treat VT
6. hyperkalemia
   - treat with hyperventilation, bicarbonate, glucose/insulin, calcium
   - bicarbonate 1-2 mEq/kg IV, calcium chloride 10 mg/kg or calcium gluconate 10-50 mg/kg
     for life-threatening hyperkalemia and check glucose levels hourly
7. follow ETCO2, electrolytes, blood gases, creatine kinase (CK), core temperature, urine output/colour with Foley catheter, coagulation studies
   - if CK and/or potassium rises persistently or urine output falls to <0.5 mL/kg/h, induce
clearance to >1 mL/kg/h urine to avoid myoglobinuric renal failure
8. maintain anesthesia with benzodiazepines, opioids, and propofol
9. transfer to ICU bed

Abnormal Pseudocholinesterase

- pseudocholinesterase hydrolyzes SCh and mivacurium
- individuals with abnormal pseudocholinesterase will have prolonged muscular blockade
- SCh and mivacurium are contraindicated in those with abnormal pseudocholinesterase
- if SCh or mivacurium are given accidentally, treat with mechanical ventilation until function returns to normal (do not use cholinesterase inhibitors)

Common Medications

<tr>
<td>Nitrous oxide (N2O)*</td>
<td>104</td>
<td>—</td>
<td>—</td>
<td>—</td>
<td>—</td>
</tr>
</tbody>
</table>

*Properties and Adverse Effects of N2O

Due to its high MAC, nitrous oxide is combined with other anesthetic gases to attain surgical anesthesia. A MAC of 104% is possible in a pressurized chamber only. Second Gas Effect: see Determinants of Speed of Onset of Volatile Anesthetics sidebar, A17

Expansion of closed spaces: closed spaces such as a pneumothorax, the middle ear, bowel lumen and ET cuff will markedly enlarge if N2O is administered

Diffusion hypoxia: during anesthesia, the washout of N2O from body stores into alveoli can dilute the alveolar [O2], creating a hypoxic mixture if the original [O2] is low

**Coronary steal: isoflurane causes small vessel dilation which may compromise blood flow to areas of the heart with fixed perfusion (e.g. stents, atherosclerosis)
Table 14. Depolarizing Muscle Relaxants (Non-Competitive): Succinylcholine (SCh)

<table>
<thead>
<tr>
<th>Mechanism of Action</th>
<th>Mimics ACh and binds to ACh receptors causing prolonged depolarization; initial fasciculation may be seen, followed by temporary paralysis secondary to blocked ACh receptors by SCh.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Intubating Dose</td>
<td>1-1.5 mg/kg</td>
</tr>
<tr>
<td>Onset</td>
<td>30-60 s – RAPID (fastest of all muscle relaxants)</td>
</tr>
<tr>
<td>Duration</td>
<td>3-5 min – SHORT (no reversing agent for SCh)</td>
</tr>
<tr>
<td>Metabolism</td>
<td>SCh is hydrolyzed by plasma cholinesterase (pseudocholinesterase), found only in plasma and not at the NMJ.</td>
</tr>
</tbody>
</table>
| Indications         | • Assist intubation  
• Increased risk of aspiration (need rapid paralysis and airway control)  
• Short procedures (e.g. full stomach), hiatus hernia, obesity, pregnancy, trauma  
• Electroconvulsive therapy (ECT)  
• Laryngospasm                                                                                     |
| Side Effects         | 1. SCh also stimulates muscarinic cholinergic autonomic receptors (in addition to nicotinic receptors)                                                                                                  |
|                      | • May cause bradycardia, dysrhythmias, sinus arrest, increased secretions of salivary glands (especially in children)                                                                                   |
|                      | 2. Hyperkalemia                                                                                                                                     |
|                      | • Disruption of motor nerve activity causes proliferation of extrajunctional (outside NMJ) cholinergic receptors                                                                                       |
|                      | • Depolarization of an increased number of receptors by SCh may lead to massive release of potassium out of muscle cells                                                                               |
|                      | • Patients at risk  
• 3rd degree burns 24 h-6 mo after injury  
• Traumatic paralysis or neuromuscular diseases (e.g. muscular dystrophy)  
• Severe intra-abdominal infections  
• Severe closed head injury  
• Upper motor neuron lesions                                                                                                               |
|                      | 3. Can trigger MH                                                                                                                                    |
|                      | 4. Increased ICP/Intraocular pressure/intragastric pressure (no increased risk of aspiration if competent lower esophageal sphincter)                                                               |
|                      | 5. Fasciculations, post-operative myalgia – may be minimized if small dose of non-depolarizing agent given before SCh administration                                                                  |
| Contraindications   | Absolute  
• Known hypersensitivity or allergy, positive history of malignant hyperthermia, myotonia (m. congenita, m. dystrophica, paramyotonia congenital), high risk for hyperkalemic response |
|                      | Relative  
Known history of plasma cholinesterase deficiency, myasthenia gravis, myasthenic syndrome, familial periodic paralysis, open eye injury

Difficult Tracheal Intubation in Unconscious Patient

Figure 14. Difficult tracheal intubation encountered in the unconscious patient

SGD = supraglottic device

Difficult Tracheal Intubation

Airway exam or history predicts difficult tracheal intubation

If general anesthesia is induced . . .
1. Is tracheal intubation predicted to success in no more than 3 attempts?
2. If tracheal intubation fails, will face mask or SGD ventilation succeed?

. . . and are other patient and contextual issues favourable?
1. Rapid oxygen desaturation unlikely with onset of apnea?
2. Little risk of aspiration once unconscious?
3. No obstructing airway pathology?
4. Additional skilled help available?
5. Clinician skilled in planned technique(s) and equipment available?

Low risk of failed oxygenation if induced
Consider intubation after induction of general anesthesia
• e.g. IV induction (e.g. RSI)
• e.g. inhalational induction

Significant risk of failed oxygenation if induced
Consider awake intubation/techniques
• e.g. awake oral/nasal
• e.g. awake tracheotomy

Is awake intubation feasible?
• Patient can cooperate
• Situation acuity permits

Other options
• e.g. induction with “double set-up” preparation for immediate cricothyrotomy or tracheotomy

Figure 15. Anticipated difficult tracheal intubation
IV = intravenous; RSI = rapid sequence induction/intubation; SGD = supraglottic device

Figure 16. Adult cardiac arrest algorithm
**Adult Tachycardia**

**With Pulse**

1. Assess appropriateness for clinical condition
   - Heart rate typically ≥150/min if tachyarrhythmia

2. Identify and treat underlying cause
   - Maintain patent airway; assist breathing as necessary
   - Oxygen (if hypoxemic)
   - Cardiac monitor to identify rhythm; monitor blood pressure and oximetry

3. Persistent tachyarrhythmia causing:
   - Hypotension?
   - Acutely altered mental status?
   - Signs of shock?
   - Ischemic chest discomfort?
   - Acute heart failure?

4. Synchronized cardioversion
   - Consider sedation
   - If regular narrow complex, consider adenosine

5. Wide QRS? ≥0.12 second
   - IV access and 12-lead ECG if available
   - Consider adenosine only if regular and monomorphic
   - Consider antiarrhythmic infusion
   - Consider expert consultation

6. Persistent tachyarrhythmia causing:
   - Adenosine IV Dose:
     - First dose: 6 mg rapid IV push; follow with NS flush
     - Second dose: 12 mg if required
   - Antiarrhythmic Infusions for Stable Wide-QRS Tachycardia
     - Procainamide IV Dose:
       - First dose: 20-50 mg/min until arrhythmia suppressed, hypotension ensues, QRS duration increases ≥50%, or maximum dose 17 mg/kg given
       - Maintenance infusion: 1-4 mg/min
       - Avoid if prolonged QT or CHF
     - Amiodarone IV Dose:
       - First dose: 150 mg over 10 min
       - Repeat as needed if VT recurs
       - Follow by maintenance infusion of 1 mg/min for first 6 h
     - Sotalol IV Dose:
       - 100 mg (1.5 mg/kg) over 5 min
       - Avoid if prolonged QT

**Adult Bradycardia**

**With Pulse**

1. Assess appropriateness for clinical condition
   - Heart rate typically <50/min if bradyarrhythmia

2. Identify and treat underlying cause
   - Maintain patent airway; assist breathing as necessary
   - Oxygen (if hypoxemic)
   - Cardiac monitor to identify rhythm; monitor blood pressure and oximetry
   - IV access
   - 12-Lead ECG if available; do not delay therapy

3. Persistent bradyarrhythmia causing:
   - Hypotension?
   - Acutely altered mental status?
   - Signs of shock?
   - Ischemic chest discomfort?
   - Acute heart failure?

4. Monitor and observe
   - No
   - Yes

5. Atropine
   - If atropine ineffective:
     - Transcutaneous pacing
     - Dopamine infusion
     - Epinephrine infusion

6. Consider:
   - Expert consultation
   - Transvenous pacing

---

Coronary Anatomy Circulation

- conventional arterial supply to the heart arises from the right and left coronary arteries, which originate from the root of the aorta
  - right coronary artery (RCA)
    - acute marginal branches
    - atrioventricular (AV) nodal artery
    - posterior interventricular artery (PIV) = posterior descending artery (PD)
  - left main coronary artery (LCA): two major branches
    - left anterior descending artery (LAD)
      - septal branches
      - diagonal branches
    - left circumflex artery (LC)
      - obtuse marginal branches
- dominance of circulation
  - right-dominant circulation: PIV and at least one posterolateral branch arise from RCA (80%)
  - left-dominant circulation: PIV and at least one posterolateral branch arise from LC (15%)
  - balanced circulation: dual supply of posteroinferior LV from RCA and LC (5%)
- the sinoatrial (SA) node is supplied by the SA nodal artery, which may arise from the RCA (60%) or LCA (40%)
- most venous blood from the heart drains into the RA through the coronary sinus, although a small amount drains through thebesian veins into all four chambers, contributing to the physiologic R-L shunt

Figure 1. Anatomy of the coronary arteries (right anterior oblique projection)
Figure 2a. Cardiac cycle
Grey shaded bars indicate isovolumic contraction (left) and isovolumic relaxation (right)

Figure 2b. JVP waveform

Legend:
AV – aortic valve
LA – left atrium
LV – left ventricle
MV – mitral valve

Cardiac Anatomy

- layers of the heart
  - endocardium
  - myocardium
  - epicardium
  - visceral pericardium
  - parietal pericardium

- valves
  - semilunar valves: no subvalvular apparatus present
    - aortic valve, 3 valve leaflets: separates LV and ascending aorta
    - pulmonic valve, 3 valve leaflets: separates RV and main pulmonary artery (PA)
  - atrioventricular valves: subvalvular apparatus present in the form of chordae tendinae and papillary muscles
    - tricuspid valve, 3 valve leaflets: separates RA and RV
    - mitral valve, 2 valve leaflets: separates LA and LV

- conduction system
  - SA node governs pacemaking control
  - anterior-, middle-, and posterior-interval nodal tracts carry impulses in the right atrium and along Bachmann's bundle in the left atrium
  - atrial impulses converge at the AV node
    - the AV node is the only conducting tract from the atria to the ventricles because of electrical isolation by the annulus fibrosis (except when accessory pathways are present)
    - the bundle of His bifurcates into left and right bundle branches (LBB and RBB)
    - RBB further splits into anterior and posterior fascicles
    - RBB and fascicles of LBB give off Purkinje fibres which conduct impulses into the ventricular myocardium

Figure 3. Conduction system of the heart

Figure 4. Blood vessel structure

Features of Abnormal JVP Wave Formation
- Atrial fibrillation: absent a wave
- 3rd degree heart block: cannon a waves
- Tricuspid regurgitation: cv wave, elevated JVP
- Cardiac tamponade: x descent only, absent y descent
- Constrictive pericarditis: prominent y descent, Kussmaul's sign (paradoxic increase in JVP with inspiration)

cardiovascular innervation
- sympathetic nerves
  - innervate the SA node, AV node, ventricular myocardium and vasculature
  - SA node (β1) fibres increase pacemaking activity (chronotropy)
  - cardiac muscle (β1) fibres increase contractility (inotropy) to help increase cardiac output
  - stimulation of β1- and β2-receptors in the skeletal and coronary circulation causes vasodilatation
- parasympathetic nerves
  - innervate the SA node, AV node, atrial myocardium but few vascular beds
  - basal vagal tone dominates the tonic sympathetic stimulation of the SA node and AV node resulting in slowing of pacemaker activity and conduction (i.e. reduced dromotropy – if only affecting AV node conduction)
  - parasympathetics have very little impact on total peripheral vascular resistance

Differential Diagnoses of Common Presentations

Note: **bold** text indicates most common, *underlined* text indicates life threatening condition

### Chest Pain
- cardiac
  - **MI**/angina
  - myocarditis
  - pericarditis/Dressler’s syndrome
  - cardiac tamponade
- pulmonary
  - pneumonia
  - PE
  - pneumothorax/hemothorax, tension pneumothorax
  - empyema
  - pulmonary neoplasm
  - bronchiectasis
  - TB
- gastrointestinal
  - esophageal: spasm, GERD, esophagitis, ulceration, achalasia, neoplasm, Mallory-Weiss syndrome, esophageal rupture

### Loss of Consciousness
- hypovolemia
- cardiac
  - structural or obstructive causes
    - ACS
    - AS
    - HCM
    - *cardiac tamponade*, constrictive pericarditis
    - arrhythmias (see Arrhythmias, C17)
- respiratory
  - massive pulmonary embolism
  - pulmonary hypertension
  - hypoxia
  - hypercapnia
- neurologic
  - stroke/TIA
    - (esp. vertebrobasilar insufficiency)

### Generalized Edema
- increased hydrostatic pressure/fluid overload
  - heart failure
  - pregnancy
  - drugs (e.g. CCBs)
  - *iatrogenic* (e.g. IV fluids)
- decreased oncotic pressure/ hypoalbuminemia
  - nephrotic syndrome
- liver cirrhosis
- malnutrition
- increased capillary permeability
- severe sepsis
- hormonal
- hypothyroidism
- exogenous steroids
- pregnancy
- estrogens

### Local Edema
- inflammation/infection
- venous or lymphatic obstruction
  - thrombophlebitis/deep vein thrombosis
- venous insufficiency
- chronic lymphangitis
- lymphatic tumour infiltration
- filariasis
- migraine
- seizure
- metabolic
  - anemia
  - *hypoglycemia*
- drugs
  - antihypertensives
  - antiarrhythmics
  - diuretics
  - vasovagal
  - autonomic dysfunction
  - diabetic neuropathy
  - psychiatric
  - panic attack
Palpitations

- cardiac
  - arrhythmias (PAC, PVC, SVT, VT)
  - valvular heart disease
  - HCM
- endocrine
  - thyrotoxicosis
  - pheochromocytoma
  - hypoglycemia
- systemic
  - fever
  - anemia
- drugs
  - stimulants and anticholinergics
- psychiatric
  - panic attack

Dyspnea

- cardiovascular
  - acute MI
  - CHF/LV failure
  - aortic/mitral stenosis
  - aortic/mitral regurgitation
  - arrhythmia
  - cardiac tamponade
  - constrictive pericarditis
  - left-sided obstructive lesions (e.g. left atrial myxoma)
  - elevated pulmonary venous pressure
- respiratory
  - airway disease
    - asthma
  - COPD exacerbation
  - upper airway obstruction
    (anaphylaxis, foreign body, mucus plugging)
- parenchymal lung disease
  - ARDS
  - pneumonia
  - interstitial lung disease
  - pulmonary vascular disease
  - PE
  - pulmonary HTN
  - pulmonary vasculitis
  - pleural disease
  - pneumothorax
  - pleural effusion
  - neuromuscular and chest wall disorders
    - C-spine injury
    - polymyositis, myasthenia gravis, Guillain-Barré syndrome
    - kyphoscoliosis
    - anxiety/psychosomatic
    - hematological/metabolic
      - anemia, acidosis, hypercapnia

Cardiac Diagnostic Tests

Electrocardiography Basics

Description
- a graphical representation (time versus amplitude of electrical vector projection) of the electrical activity of the heart

Indications
- detect myocardial injury, ischemia, and the presence of prior infarction
- palpitations, syncope, antiarrhythmic drug monitoring
- arrhythmia surveillance in patients with documented or potentially abnormal rhythms
- surveillance of non-sustained arrhythmias that can lead to prophylactic intervention

Contraindications
- no absolute contraindications
- patient refusal
- allergies (sensitivities to electrodelatex adhesive)

Risks
- no absolute risks

on the ECG graph
  - the horizontal axis represents time (at usual paper speed 25 mm/s)
    - 1 mm (1 small square) = 40 msec
    - 5 mm (1 large square) = 200 msec
  - the vertical axis represents voltage (at usual standard gain setting 10 mm/mV)
    - 1 mm (1 small square) = 0.1 mV
    - 10 mm (2 large squares) = 1 mV
- leads
  - standard 12-lead ECG
    - limb leads: I, II, III, aVL, aVF, aVF
    - precordial leads: V1-V6 (V1-V2 septal, V3-V4 anterior, V5-V6 lateral)
  - additional leads
    - right-sided leads: V3R-V6R (useful in RV infarction and dextrocardia)
    - lateral = I, aVL, V5, V6; inferior = II, III, aVF; anterior = V1-V4

Figure 5. ECG lead placement

Figure 6. ECG waveforms and normal values
Approach to ECGs

Introduction
Historically, the electrocardiogram has been a tricky subject for medical students. For many years, the classical approach has been taught in medical schools, which has demystified the ECG. Below, we are presenting both the Classical Approach and the newer PQRSTU Approach to provide students with different ways to view the ECG. Despite methodological differences, the rigor and final result is the same. These two approaches should help you better understand the concepts of ECG interpretation and equip you with the necessary skills to interpret ECGs in exam scenarios and clinical practice.

Classical Approach to ECGs

RATE
• normal = 60-100 bpm (atrial rate: 150-250 bpm = paroxysmal tachycardia, 250-350 bpm = atrial flutter, >350 bpm = AFib)
• regular rhythm
  • to calculate the rate, divide 300 by number of large squares between 2 QRS complexes (there are 300 large squares in 1 min: 300 x 200 msec = 60 sec)
  • or remember 300-150-100-75-60-50-43 (rate falls in this sequence with the number of large squares between 2 QRS complexes)
• irregular rhythm
  • rate = 6 x number of R-R intervals in 10 s (the ”rhythm strips” are 10 sec recordings)
  • types: wandering pacemaker, multifocal atrial tachycardia, AFib
• atrial escape = 60-80 bpm; junctional escape = 40-60 bpm; ventricular escape = 20-40 bpm

RHYTHM
• regular: R-R interval is the same across the tracing
• irregular: R-R interval varies across the tracing
• regularly irregular: repeating pattern of varying R-R intervals
• irregularly irregular: R-R intervals vary erratically
• normal sinus rhythm (NSR)
  • P wave precedes each QRS; QRS follows each P wave
  • P wave axis is normal (positive in 2 out of the 3 following leads I, aVF, II)
  • rate between 60-100 bpm

AXIS
• mean axis indicates the direction of the mean vector
• can be determined for any waveform (P, QRS, T)
• the standard ECG reported QRS axis usually refers to the mean axis of the frontal plane – it indicates the mean direction of ventricular depolarization forces
• QRS axis in the frontal plane
  • normal axis: -30° to 90° (i.e. positive QRS in leads I and II)
  • left axis deviation (LAD): axis < -30°
  • right axis deviation (RAD): axis > 90°
• QRS axis in the horizontal plane is not routinely calculated – it is directed posteriorly and to the left
• transition from negative to positive is usually in lead V3

Table 1. Conduction Abnormalities

</tr>
</tbody>
</table>

ISCHEMIA/INFARCTION
- look for the anatomic distribution of the following ECG abnormalities (see Table 3)
- ischemia
  - ST segment depression
  - T wave inversion (most commonly in V1-V6)
- injury
  - transmural (involving the epicardium)
    - ST elevation in the leads facing the area injured/infarcted
    - transient ST elevation may occur in patients with coronary artery spasm (e.g. Prinzmetal angina) which can be slight or prominent (>10 mm)
  - subendocardial
    - marked ST depression in the leads facing the affected area
    - may be accompanied by enzyme changes and other signs of MI
    - may also occur with angina

Figure 10. Typical ECG changes with infarction
- evolving infarction (ST elevation in contiguous leads in the same territory = acute MI)
- ST elevation: at least 1 mm in 2 adjacent limb leads or at least 1-2 mm in adjacent precordial leads in STEMI (signifies occlusion and transmural ischemic injury) vs. diffuse pattern in early pericarditis
- "typical" sequential changes of evolving MI
  1. hyperacute T waves (tall, symmetric T waves) in the leads facing the infarcted area, with or without ST elevation
  2. ST elevation (injury pattern) in the leads facing the infarcted area
    • usually in the first hours post infarct
    • in acute posterior infarction, there is ST depression in V1-V3 (reciprocal to ST elevation in the posterior leads, that are not recorded in the standard 12-lead ECG)
  3. significant Q waves: >40 msec or >1/3 of the total QRS and present in at least 2 consecutive leads in the same territory (hours to days post-infarct)
  4. inverted T waves (one day to weeks after infarction)
    • this classical sequence does not always occur
    - Q waves of infarction may appear in the very early stages, with or without ST changes
    - non-Q wave infarction: there may be only ST or T changes despite clinical evidence of infarction
• completed infarction
  ▪ abnormal Q waves (Q waves may be present in leads III and aVL in normal individuals due to initial septal depolarization)
    ▪ duration >40 msec (>30 msec in aVF for inferior infarction)
    ▪ Q/QRS voltage ratio is >33%
    ▪ present in at least 2 consecutive leads in the same territory
  ▪ abnormal R waves (R/S ratio >1, duration >40 msec) in V1 and occasionally in V2 are found in posterior infarction (usually in association with signs of inferior and/or lateral infarction)

Table 3. Areas of Infarction/Ischemia (right dominant anatomy)

<table>

</table>

### MISCELLANEOUS ECG CHANGES

**Electrolyte Disturbances**

- hyperkalemia
  ▪ mild to moderate (K+ 5-7 mmol/L): tall peaked T waves
  ▪ severe (K+ >7 mmol/L): progressive changes whereby P waves flatten and disappear, QRS widens and may show bizarre patterns, axis shifts left or right, ST shift with tall T waves, eventually becomes a "sine wave" pattern
- hypokalemia
  ▪ ST segment depression, prolonged QT interval, low T waves, prominent U waves (U>T)
  ▪ enhances the toxic effects of digitals
- hypercalcemia
  ▪ shortened QT interval (more extracellular Ca²⁺ means shorter plateau in cardiac action potential)
- hypocalcemia
  ▪ prolonged QT interval (less extracellular Ca²⁺ means longer plateau in cardiac action potential)

**Hypothermia**

- sinus bradycardia
- when severe, prolonged QRS and QT intervals
- AFib with slow ventricular response and other atrial/ventricular dysrhythmias
- Osborne J waves: “hump-like” waves at the junction of the J point and the ST segment

**Pericarditis**

- early: diffuse ST segment elevation ± PR segment depression, upright T waves
- later: isoelectric ST segment, flat or inverted T waves
- ± tachycardia

**Drug Effects**

- digitals
  ▪ therapeutic levels may be associated with "digitalis effect"
    ▪ ST downsloping or "scooping"
    ▪ T wave depression or inversion
    ▪ QT shortening ± U waves
    ▪ slowing of ventricular rate in AFib

### Low Voltage

- Definition: total QRS height in precordial leads <10 mm and/or limb leads <5 mm
- Differential diagnosis
  ▪ Myocardial disease
    ▪ Ischemia
    ▪ Cardiomyopathy (usually infiltrative type), myocardiitis
  ▪ Pericardial effusion
  ▪ Thick chest wall/barrel chest: COPD, obesity
  ▪ Generalized edema
  ▪ Hypothyroidism/myxedema
  ▪ Inappropriate voltage standardization

**Figures**

- Figure 11. Hyperkalemia
- Figure 12. Hypokalemia
- Figure 13. Osborne J waves of a hypothermic patient
- Pacemakers
  ▪ Demand pacemaker has discharge (narrow vertical spike on ECG strip) prior to widened QRS
  ▪ Atrial pacemaker has discharge prior to P wave
  ▪ Triggered pacemaker has discharge following the P wave but prior to the widened QRS
  ▪ Atrial and ventricular pacing have discharge before the P wave and widened QRS wave
• toxic levels associated with
  • arrhythmias: paroxysmal atrial tachycardia (PAT) with conduction block, severe bradycardia in AFib, accelerated junctional rhythms, PVCs, ventricular tachycardia (see Arrhythmias, C17)
  • “regularization” of ventricular rate in AFib due to a junctional rhythm and AV dissociation
• amiodarone, quinidine, phenothiazines, tricyclic antidepressants, antipsychotics, some antihistamines, some antibiotics: prolonged QT interval, U waves

Figure 14. Atrial fibrillation, ST change due to digitalis (“digitalis effect”)

Pulmonary Disorders
• cor pulmonale (often secondary to COPD)
  • low voltage, right axis deviation (RAD), poor R wave progression in precordial leads
  • RAE and RVH with strain
• multifocal atrial tachycardia (MAT)
• massive pulmonary embolism (PE)
  • sinus tachycardia and AFib/atrial flutter are the most common arrhythmias
  • RAD, RVH with strain
• most specific sign is S1Q3T3 (S in I, Q and inverted T wave in III) but rather uncommon

Alternative PQRSTU Approach to ECGs

Note: the information seen in this alternative approach – the PQRSTU Approach – is the same as the information in the Classical Approach; it is just organized in a slightly different way based on the anatomy of the ECG

Figure 15. ECG correlations with heart activity
P WAVE
- the P wave provides a view into the atria of the heart and represents atrial contraction
- the best leads to view the P waves are II and V1
- assess the P waves for rate (based on the P-P interval relative to the R-R interval), rhythm (rounded, flutter/sawtooth, fibrillation) and axis
- lead II: the P wave should be rounded, <120 msec and <2.5 mm in height
- lead V1: the P wave is biphasic with a negative phase slightly greater than the positive phase

Common P Wave Pathology
- atrial flutter: sawtooth P wave (HINT: flip the ECG upside-down to see it better if unclear)
- atrial fibrillation: absent P wave, may have fibrillatory wave, irregular rhythm
- right atrial enlargement: tall P wave (>2.5 mm) in II or V1 (P pulmonale)
- left atrial enlargement: negative deflection >1 mm deep or >1 mm wide in V1, wide (>100 msec) notched P wave in II may be present (P mitrale)

P-R INTERVAL
- the P-R interval shows the delay between atrial and ventricular contraction that is mediated by the AV node; the magnitude of the delay is referred to as “dromotropy”
- positive dromotropy increases conduction velocity (e.g. epinephrine stimulation), negative dromotropy decreases velocity (e.g. vagal stimulation)
- P-R interval should be 120-200 msec
- long P-R interval (>200 msec)
  - heart block: first degree (fixed, prolonged P-R interval), second degree Mobitz I/Wenckebach (steadily prolonging to eventual dropped beat)
  - heart block
    - first degree: fixed, prolonged P-R interval
    - second degree Mobitz I/Wenckebach: steadily prolonging P-R interval to eventual dropped beat
    - second degree Mobitz II/Hay: fixed P-R interval with ratio of beat to dropped beat (e.g. for every 3 beats, there is one dropped beat [3:1])
    - third degree/complete: variable P-R intervals, P-P and R-R intervals individually constant but not in sync
  - atrial flutter
  - sinus bradycardia (normal to have long P-R if heart rate slow)
  - hypokalemia
  - trifascicular block
- short P-R interval (<120 msec)
  - pre-excitation syndrome (delta wave: upswooping of the P-R segment into the QRS complex indicating pre-excitation)
  - accessory pathways
  - WPW

QRS COMPLEX
- the QRS is where ventricular contraction is visualized
- rate: check the R-R interval to see if it matches the P-P interval
- amplitude: check for hypertrophy (see Table 2, C7)
- narrow width (<120 msec) QRS means that the His-Purkinje system is being used
- wide width (>120 msec) QRS means that the His-Purkinje system is being bypassed or is diseased
  - BBB, VT, ventricular hypertrophy, cardiomyopathy, WPW, ectopic ventricular beat, hyperkalemia, drugs (e.g. TCAs, antiarrhythmics)
  - Q wave: the first downward deflection of the QRS complex
    - significant Q wave: >40 msec or >33% of total QRS amplitude; indicate myocardial necrosis (new or historical)
  - R and S wave abnormalities typically show pathology in terms of BBB or intraventricular abnormalities

ST SEGMENT
- one of the more famous ECG personas mostly due to its role in detecting MI
- located between QRS complex and the T wave
  - corresponds to the completion of ventricular depolarization
  - normally at the same level as "baseline/TP segment"
- ST elevation: at least 1 mm in 2 adjacent limb leads or at least 1-2 mm in adjacent precordial leads in STEMI (signifies occlusion and transmural ischemic injury) vs. diffuse pattern in early pericarditis
- ST depression: ischemia
  - ischemia which causes ST depression can result in myocardial damage (NSTEMI)
  - lateral ST depression (leads I, aVL, V5, V6) may actually indicate a STEMI in the right heart
T WAVE
- This is the repolarization phase of the ventricles (repolarization of the atria are obscured by the QRS complex)
- Typically positive (except in aVR and V1) on ECG but normal isolated negative T waves may be present (esp. in V1 and V2)
- Pathology when T wave variation occur in consecutive leads
  - Inversion: BBB, ischemia, hypertrophy, drugs (e.g. digitalis), pulmonary embolism (lead III as part of S1Q3T3 sign)
  - Elevation: infarction (STEMI, Prinzmetal, hyperacute), hyperkalemia (wider, peaked)
  - Flattened: hypokalemia, pericarditis, drugs (e.g. digitalis), pericardial effusion
  - Variations: T wave alternans; beat-to-beat variations due to PVC overlap (R on T phenomenon which may precipitate VT or VFib)
- Appropriate T wave discordance: in BBB, T wave deflection should be opposite to that of the terminal QRS deflection (i.e. T wave negative if ends with R or R'; positive if ends with S)
- Inappropriate T wave concordance suggests ischemia or infarction

Q-T INTERVAL
- This represents the duration of ventricular depolarization and repolarization and is often difficult to interpret
- Corrected QT (QTc) is often used instead in practice to correct for the repolarization duration; QTc = QT / √RR
- Normal QTc is 360-450 msec for males and 360-460 for females
  - Increased (>450 msec for males and >460 for females): risk of Torsades de Pointes (a lethal tachyarrhythmia)
  - Decreased (<360 msec): risk of VFib
- Genetic Long QT Syndrome (often a channelopathy)
- Drugs: antibiotics, SSRIs, antipsychotics, antiarrhythmics
- Electrolytes: low Ca²⁺, low Mg²⁺, low K⁺
- Others: hypothyroidism, hyperthermia, cardiomyopathy

U WAVE
- Origin unclear but may be repolarization of Purkinje fibres or delayed/prolonged repolarization of the myocardium
- More visible at slower heart rates
- Deflection follows T wave with <25% of the amplitude
- Variations from norm could indicate pathologic conditions:
  - Prominent (>25% of T wave): electrolyte (low K⁺), drugs (digoxin, antiarrhythmics)
  - Inverted (from T wave): ischemia, volume overload

Cardiac Biomarkers
- Provide diagnostic and prognostic information in acute coronary syndromes and in heart failure

Table 4. Cardiac Enzymes

<table>
<thead>

</tbody>
</table>

- Check troponin I at presentation and 8 h later ± creatine kinase-MB (CK-MB; depends on local laboratory protocol)
- New CK-MB elevation can be used to diagnose re-infarction
- Other biomarkers of cardiac disease
  - AST and LDH also increased in MI (low specificity)
  - BNP and NT-proBNP: secreted by ventricles in response to increased end-diastolic pressure and volume
  - DDx of elevated BNP: CHF, AFib, PE, COPD exacerbation, pulmonary HTN
Ambulatory ECG

- **description**
  - extended ambulatory ECG of 24 or 48 hours or 14 or 30 days duration
  - provides a view of only two or three leads of electrocardiographic data over an extended period of time
  - permits evaluation of changing dynamic cardiac electrical phenomena that are often transient and of brief duration
  - **continuous loop**: a small, lightweight, battery operated recorder that records two or three channels of electrocardiographic data
    - patient activated event markers
    - minimum of 24–48 h
  - **implantable device**: subcutaneous monitoring device for the detection of cardiac arrhythmias
    - typically implanted in the left pectoral region and stores events when the device is activated automatically according to programmed criteria or manually with magnet application
    - can be used for months to years

- **indications**
  - evaluation of cardiac rhythm abnormalities
  - has also been used for assessing pacemaker and implantable cardioverter-defibrillator function, evidence of myocardial ischemia, late potentials, and heart rate variability

- **contraindications**
  - no absolute contraindications
  - patient refusal
  - allergies (sensitivities to latex adhesive)

- **risks**: no absolute risks

Transesophageal Echocardiography (TEE)

- **description**: ultrasound beams are directed across the chest wall to obtain images of the heart

- **indications**
  - evaluation of LVEF, wall motion abnormalities, myocardial ischemia and complications of MI
  - evaluation of chamber size, wall thickness, valve morphology, proximal great vessel morphology, pericardial effusion
  - evaluation of unexplained hypotension, murmurs, syncope, congenital heart disease

- **contraindications**
  - limited information retrieved from patients with a thick chest wall (obesity) or overcrowded ribs (underweight) due to penetration of ultrasound waves

- **risks**: No absolute risks

**Echocardiography**

**Transthoracic Echocardiography (TTE)**

- **description**: ultrasound beams are directed across the chest wall to obtain images of the heart

- **indications**
  - evaluation of LVEF, wall motion abnormalities, myocardial ischemia and complications of MI
  - evaluation of chamber size, wall thickness, valve morphology, proximal great vessel morphology, pericardial effusion
  - evaluation of unexplained hypotension, murmurs, syncope, congenital heart disease

- **contraindications**
  - limited information retrieved from patients with a thick chest wall (obesity) or overcrowded ribs (underweight) due to penetration of ultrasound waves

- **risks**: No absolute risks

**Transoesophageal Echocardiography (TEE)**

- **description**: invasive procedure used to complement transthoracic echocardiography

- **indications**
  - evaluation for left atrial/leaflet atrial appendage thrombus in a patient with atrial fibrillation/atrial flutter to facilitate clinical decision making regarding anticoagulation, cardioversion, or ablation

- **contraindications**
  - suspected acute aortic pathology (i.e. dissection, transection, intramural hematoma)
  - suspected prosthetic valve dysfunction
  - suspected complications of endocarditis (fistula, abscess)
  - known serious esophageal pathology (e.g. esophageal stricture, bleeding esophageal varices)

- **risks**
  - serious complications are extremely rare (<1 in 5,000)
  - esophageal perforation
  - gastrointestinal bleeding
  - pharyngeal hematoma
  - methemoglobinemia (topical benzocaine and related agents used for posterior pharyngeal anesthesia)
Stress Echocardiography (SE)
- **description:** echocardiography using either exercise (treadmill or bicycle) or pharmacologic agents (dobutamine) as the stress mechanism
- **indications**
  - when ECG cannot be interpreted appropriately
  - intermediate pre-test probability with normal/equivocal exercise ECG
  - post-ACS when used to decide on potential efficacy of revascularization
  - to evaluate the clinical significance of valvular heart disease
  - evaluation of myocardial viability, dyspnea of possible cardiac origin, mitral valve disease, aortic stenosis, mitral regurgitation, pulmonary hypertension in patients with hypertrophic cardiomyopathy (for LVOT obstruction)
  - dobutamine
    - pharmacologic stress for patients who are physically unable to exercise; same indications as exercise stress echo
    - low dose dobutamine stress echo can be used to assess myocardial viability and for assessing aortic stenosis with LV systolic dysfunction
- **contraindications**
  - contraindications to exercise testing
  - contraindications to dobutamine stress echocardiography: tachyarrhythmias and systemic hypertension
  - AAA has been considered as a relative contraindication to exercise testing or dobutamine stress echocardiograph
- **risks**
  - no known adverse effects
  - dobutamine: cardiac and non-cardiac side effects can occur; VF and MI are rare

Contrast Echocardiography with Agitated Saline Contrast
- **description:** improves resolution and provides real-time assessment of intracardiac blood flow
  - conventional agent is agitated saline (contains microbubbles of air)
  - allows visualization of right heart and intracardiac shunts, most commonly patent foramen ovale (PFO) and intrapulmonary shunt
- **indications**
  - cardiac shunt (ASD, VSD, etc.)
  - extra-cardiac shunt: PDA
  - pulmonary AV fistula
  - patent foramen ovale (PFO)
  - structure identification (persistent left SVC)
  - evaluation of complex congenital heart disease
  - evaluation of TR by enhancing the Doppler signal

Contrast Echocardiography with Transpulmonary Contrast Agents
- **description:** newer contrast agents are capable of crossing the pulmonary bed and achieving left heart opacification following intravenous injection; these contrast agents improve visualization of endocardial borders and enhance evaluation of LV ejection fraction, wall motion abnormalities, and intracardiac mass
- **indications**
  - visualization of the endocardial border when ≥2 consecutive segments are not seen on non-contrast images
  - potential assessment of myocardial profusion, viability
- **contraindications**
  - known hypersensitivity to perflutren (Definity)
  - for FS069 (Optison) only, known hypersensitivity to blood, blood products, or albumin
  - fixed right to left, bi-directional or transient right to left cardiac shunts
- **risks**
  - risk of non-fatal MI and death are rare
  - ultrasound contrast agents may cause back pain, headache, urticaria, and anaphylaxis

**Stress Testing**

**EXERCISE TESTING**
- **description:** cardiovascular stress test that uses treadmill or bicycle exercise with electrocardiographic and blood pressure monitoring
- **indications**
  - patients with intermediate (10-90%) pretest probability of CAD based on age, gender, and symptoms
  - ST depression <1 mm at rest, no left bundle branch block, no digoxin or estrogen use
exercise test results stratify patients into risk groups
1. low risk patients can be treated medically without invasive testing
2. intermediate risk patients may need additional testing in the form of exercise imaging studies or cardiac catheterization
3. high risk patients should be referred for cardiac catheterization

contraindications
- acute myocardial infarction (within two days)
- unstable angina pectoris
- uncontrolled arrhythmias causing symptoms of hemodynamic compromise
- symptomatic severe valvular stenosis
- uncontrolled symptomatic heart failure
- active endocarditis or acute myocarditis or pericarditis
- acute aortic dissection
- acute pulmonary or systemic embolism
- acute non-cardiac disorders that may affect exercise performance or may be aggravated by exercise
- termination of exercise testing
  - patient’s desire to stop
  - drop in systolic blood pressure of >10 mmHg from baseline despite an increase in workload, when accompanied by other evidence of ischemia
  - moderate to severe angina
  - ST elevation (>1 mm) in leads without diagnostic Q-waves (other than V1 or aVR)
  - increasing nervous system symptoms (e.g. ataxia, dizziness, or near syncope)
  - signs of poor perfusion (cyanosis or pallor)
  - technical difficulties in monitoring ECG or systolic blood pressure
  - sustained ventricular tachycardia

risks: death, myocardial infarction, arrhythmia, hemodynamic instability, and orthopedic injury (<1-5/10,000 supervised tests)

NUCLEAR CARDIOLOGY
description
- myocardial perfusion imaging (MPI) with ECG-gated single photon emission computed tomography (SPECT), using radiolabelled tracer
- evaluates myocardial viability, detects ischemia, and assesses perfusion and LV function simultaneously
- predicts the likelihood of further cardiac event rates independent of the patient’s history, examination, resting ECG, and stress ECG
- often denoted as MIBI scan with reference to radiolabelled tracer (sestamibi)
- stress with either treadmill or IV vasodilator stress (dipyridamole, adenosine, regadenoson)
- images of the heart obtained during stress and at rest 3-4 h later
- tracers
  - Thallium-201 (²⁰¹Tl, a K⁺ analogue)
  - Technetium-99 (⁹⁹Tc)-labeled tracer (sestamibi/Cardiolite® or hexamibi/Myoview®)

Indications
- exercise MPI
  - when ECG cannot be interpreted appropriately
  - intermediate pre-test probability with normal-equivocal exercise ECG
  - in patients with previous imaging whose symptoms have changed
  - to diagnose ischemia
- dipyridamole/adenosine MPI
  - to diagnose CAD in possible ACS patients with non-diagnostic ECG and negative serum biomarkers
  - when ECG is cannot be interpreted appropriately due to LBBB or V-paced rhythm among patients unable to exercise, with the same indications as exercise MPI

contraindications
- contraindications to exercise testing
- vasodilators (i.e. adenosine, regadenoson, and dipyridamole) are contraindicated in patients with hypotension, sick sinus syndrome, high-degree AV block (in the absence of backup pacemaker capability), and reactive airways disease
- pregnancy

risks: radiation exposure

STRESS ECHOCARDIOGRAPHY
- see Echocardiography, C12
Right Heart Catheterization (Swan-Ganz Catheter)

- **description:** also known as pulmonary artery catheterization
  - obtain direct measurements of central venous, right-sided intracardiac, pulmonary artery, and pulmonary artery occlusion pressures
  - can estimate cardiac output, systemic and pulmonary vascular resistance as well as mixed venous oxyhemoglobin saturation, oxygen delivery, and oxygen uptake
  - right atrial, right ventricular, and pulmonary artery pressures are recorded
  - can also be used to measure the Cardiac Index (CI)
    - \( CI = \frac{CO}{\text{body surface area}} \)
    - cardiac index is a measure of cardiac function
    - <1.8 L/min/m² usually means cardiogenic shock
    - 2.6-4.2 L/min/m² is considered normal
  - pulmonary capillary wedge pressure (PCWP)
    - obtained by advancing the catheter to wedge in the distal pulmonary artery
    - records pressure measured from the pulmonary venous system
    - in the absence of pulmonary venous disease reflects left atrial pressure

- **indications**
  - unexplained or unknown volume status in shock
  - severe cardiogenic shock (e.g. acute valvular disease, suspected pericardial tamponade)
  - suspected or known pulmonary artery hypertension
  - severe underlying cardiopulmonary disease (e.g. congenital heart disease, left-to-right shunt, severe valvular disease, pulmonary hypertension) and undergoing corrective or other surgery

- **contraindications**
  - lack of consent
  - infection at the insertion site
  - the presence of a right ventricular assist device
  - insertion during cardiopulmonary bypass

- **risks**
  - complications for diagnostic catheterization <1%
  - inadequate diagnostic procedures occur in <1% of cases
  - complications of insertion: atrial and/or ventricular arrhythmias (~3% of patients)
  - catheter misplacement or knotting (uncommon)
  - perforation of a cardiac chamber and rupture of a cardiac valve or the pulmonary artery (rare)
  - complications of catheterization: pulmonary artery rupture, pulmonary infarction, thromboembolic events, infection, and data misinterpretation
  - within 24 h of catheterization: death, MI, or stroke (0.2% to 0.3% of patients)
Left Heart Catheterization

- **description**
  - accomplished by introducing a catheter into the brachial or femoral artery and advancing it through the aorta, across the aortic valve, and into the left ventricle
  - evaluates mitral and aortic valvular defects and myocardial disease
  - systolic and end-diastolic pressure tracings recorded
  - LV size, wall motion and ejection fraction can be assessed by injecting contrast into the LV (left ventriculography) via femoral/radial artery catheterization
  - cardiac output (measured by the Fick oxygen method or the indicator dilution method)

- **indications**
  - identification of the extent and severity of CAD and evaluation of left ventricular function
  - assessment of the severity of valvular or myocardial disorders (e.g. aortic stenosis or insufficiency, mitral stenosis or insufficiency, and various cardiomyopathies) to determine the need for surgical correction
  - collection of data to confirm and complement noninvasive studies
  - determination of the presence of CAD in patients with confusing clinical presentations or chest pain of uncertain origin

- **contraindications**
  - severe uncontrolled hypertension
  - ventricular arrhythmias
  - acute stroke
  - severe anemia
  - active gastrointestinal bleeding
  - allergy to radiographic contrast
  - acute renal failure
  - uncontrolled congestive failure (so that the patient cannot lie flat)
  - unexplained febrile illness or untreated active infection
  - electrolyte abnormalities (e.g. hypokalemia)
  - severe coagulopathy

- **risks**
  - complications for diagnostic catheterization <1%
  - inadequate diagnostic procedures occur in <1% of cases
  - within 24 h of catheterization: death, MI, or stroke (0.2% to 0.3% of patients)

Coronary Angiography

- **description**
  - radiographic visualization of the coronary vessels after injection of radiopaque contrast media
  - coronary vasculature accessed via the coronary ostia

- **indications**
  - to define the coronary anatomy and the degree of luminal obstruction of the coronary arteries
  - to determine the presence and extent of obstructive CAD
  - to assess the feasibility and appropriateness of various forms of therapy, such as revascularization by percutaneous or surgical interventions
  - can also be used when the diagnosis of CAD is uncertain and CAD cannot be reasonably excluded by noninvasive techniques

- **contraindications**: severe renal failure (due to contrast agent toxicity – must check patient’s renal status)

- **risks**: major complications <2%, but increased in patients with pre-existing renal failure (especially in diabetic patients)

**ACC/AHA 2011 Recommended Indications for Coronary Angiography**

- Disabling (CCS classes III and IV) chronic stable angina despite medical therapy
- High-risk criteria on clinical assessment or non-invasive testing
- Serious ventricular arrhythmia or CHF
- Uncertain diagnosis or prognosis after non-invasive testing
- Inability to undergo non-invasive testing

**Coronary Angiography**

Gold standard for localizing and quantifying CAD

Hemodynamically significant stenosis is defined as 70% or more narrowing of the luminal diameter

---

**Figure 18. Coronary angiogram schematic**

AM = acute marginal; LAD = left anterior descending; OM = obtuse marginal; RCA = right coronary artery

Diagnostic Catheterization
• complications for diagnostic catheterization <1%
• inadequate diagnostic procedures occur in fewer than 1% of cases
• provocative pharmacological agents can be used to unmask pathology
  ▪ fluid loading may unmask latent pericardial constriction
  ▪ afterload reduction or inotropic stimulation may be used to increase the outflow tract gradient in HCM
  ▪ coronary vasoreactive agents (e.g. methylergonovine, acetylcholine)
  ▪ a variety of pulmonary vasoreactive agents in primary pulmonary HTN (e.g. oxygen, calcium channel blockers, adenosine, nitric oxide, or prostacyclin)

Contrast-Enhanced CT Coronary Angiography
• description: fast ECG-synchronized multi-slice CT image acquisition in the heart to enable non-invasive imaging of the coronary arterial tree
• indications: often used to assess coronary artery and previous graft stenosis/viability that could not be seen during coronary angiography
• sensitivity = 85%, specificity = 90% for the diagnosis of obstructive coronary disease with >50% stenosis
• contraindications: allergy to contrast dye; severe renal dysfunction
• risks: radiation exposure

Magnetic Resonance Imaging
• description: offers high spatial resolution, eliminates the need for iodinated contrast, and does not involve exposure to ionizing radiation
• indications: valuable in assessment of congenital cardiac anomalies, abnormalities of the aorta, and assessment of viable myocardium
• contraindications: metallic foreign bodies/implants
• risks: hazards posed by certain metallic devices inside patients

CARDIAC DISEASE

Arrhythmias

Mechanisms of Arrhythmias

Alterations in Impulse Formation

A. Abnormal Automaticity
• automaticity is a property of certain cardiomyocytes to spontaneously depolarize to their threshold voltage to generate action potentials in a rhythmic fashion
• under normal circumstances only cells in the specialized conduction system (SA node, AV node, and ventricular conduction system) exhibit natural automaticity. These cells are pacemaking cells. The automaticity of these cells can become abnormally increased or decreased
• in disease (e.g. post-MI ventricular ischemia) cells in the myocardium outside the conduction system may inappropriately acquire the property of automaticity and contribute to abnormal depolarization. If these ectopic generators depolarize at a rate greater than the SA node, they assume pacemaking control and become the source of abnormal rhythm
• automaticity can be influenced by:
  ▪ neurohormonal tone (sympathetic and parasympathetic stimulation)
  ▪ abnormal metabolic conditions (hypoxia, acidosis, hypothermia)
  ▪ electrolyte abnormalities
  ▪ drugs (e.g. digitalis)
  ▪ local ischemia/infarction
  ▪ other cardiac pathology
• this mechanism is responsible for the accelerated idioventricular rhythm and ventricular tachycardia that often occurs 24-72 h post MI
B. Triggered Activity due to Afterdepolarizations

1. Early Afterdepolarizations
   - occur in the context of action potential prolongation
   - consequence of the membrane potential becoming more positive during repolarization (e.g. not returning to baseline)
   - result in self-maintaining depolarizing oscillations of action potential, generating a tachyarrrhythmia (e.g. new baseline voltage is greater than threshold, which automatically triggers a new action potential after the refractory period ends)
   - basis for the degeneration of QT prolongation, either congenital or acquired, into Torsades de Pointes

2. Delayed Afterdepolarizations
   - occur after the action potential has fully repolarized, but before the next usual action potential, thus called a delayed afterdepolarization
   - commonly occurs in situations of high intracellular calcium (e.g. digitalis intoxication, ischemia) or during enhanced catecholamine stimulation (e.g. “twitchy” pacemaker cells)

Alterations in Impulse Conduction

A. Re-Entry Circuits
   - the presence of self-sustaining re-entry circuit causes rapid repeated depolarizations in a region of myocardium (see Figure 26, C22, for an example in the context of AV nodal re-entrant tachycardia)
     - e.g. myocardium that is infarcted/ischemic will consist of non-excitable and partially excitable zones which will promote the formation of re-entry circuits

B. Conduction Block
   - ischemia, fibrosis, trauma, and drugs can cause transient, permanent, unidirectional or bidirectional block
   - most common cause of block is due to refractory myocardium (cardiomyocytes are in refractory period or zone of myocardium unexcitable due to fibrosis)
   - if block occurs along the specialized conduction system distal zones of the conduction system can assume pacemaking control
   - conduction block can lead to bradycardia or tachycardia when impaired conduction leads to re-entry phenomenon

C. Bypass Tracts
   - normally the only conducting tract from the atria to the ventricles is the AV node into the His-Purkinje system
   - congenital/acquired accessory conducting tracts bypass the AV node and facilitate premature ventricular activation before normal AV node conduction
   - see Pre-Excitation Syndromes, C23

Figure 19. Clinical approach to arrhythmias
Bradyarrhythmias

1. SA NODAL DYSFUNCTION
A. A. Sinus Bradycardia

- P axis normal (P waves positive in I and aVF)
- Rate <60 bpm; marked sinus bradycardia (<50 bpm)
- May be seen in normal adults, particularly athletes, and in elderly individuals
- Increased vagal tone or vagal stimulation; drugs (β-blockers, calcium channel blockers, etc.); ischemia/infarction

Atropine; pacing for sick sinus syndrome

Figure 20. Sinus bradycardia

2. AV CONDUCTION BLOCKS
A. First Degree AV Block

- Prolonged PR interval (>200 msec)
- Frequently found among otherwise healthy adults

No treatment required

Figure 21. First degree AV block

B. Second Degree AV Block: Type I (Mobitz I)

- A gradual prolongation of the PR interval precedes the failure of conduction of a P wave (Wenckebach phenomenon)
- AV block is usually in AV node (proximal) triggers (usually reversible): increased vagal tone (e.g. following surgery), RCA-mediated ischemia

Figure 22. Second degree AV block with Wenckebach phenomenon (Mobitz I) (4:3 conduction) (lead V1)

B. Second Degree AV Block: Type II (Mobitz II)

- The PR interval is constant; there is an abrupt failure of conduction of a P wave
- AV block is usually distal to the AV node (i.e. bundle of His); increased risk of high grade or 3rd degree AV block

Figure 23. Second degree AV block (Mobitz II) (3:2 conduction) (lead V1)

B. Third Degree AV Block: Type II

- Complete failure of conduction of the supraventricular impulses to the ventricles; ventricular depolarization initiated by an escape pacemaker distal to the block
- Wide or narrow QRS, P-P and R-R intervals are constant, variable PR intervals; no relationship between P waves and QRS complexes (P waves “marching through”)

Management (see Electrical Pacing, C25)

Figure 24. Third degree AV block (complete heart block) (lead II)

Supraventricular Tachyarrhythmias

Presentation for SVT (and Pre-Excitation Syndromes)

- presentation can include: palpitations, dizziness, dyspnea, chest discomfort, presyncope/syncope
- may precipitate CHF, hypotension, or ischemia in patients with underlying disease
- untreated tachycardias can cause cardiomyopathy (rare, potentially reversible with treatment of SVTs)
- includes supraventricular and ventricular rhythms

Supraventricular Tachyarrhythmias

- tachyarrhythmias that originate in the atria or AV junction
- this term is used when a more specific diagnosis of mechanism and site of origin cannot be made
- characterized by narrow QRS, unless there is pre-existing bundle branch block or aberrant ventricular conduction (abnormal conduction due to a change in cycle length)

Sinus Tachycardia

- sinus rhythm with rate >100 bpm
- occurs in normal subjects with increased sympathetic tone (e.g. exercise, emotions, pain), alcohol use, caffeinated beverages, drugs (e.g. β-adrenergic agonists, anticholinergic drugs, etc.)
- etiology: fever, hypotension, hypovolemia, anemia, thyrotoxicosis, CHF, MI, shock, PE, etc.
- treatment: treat underlying disease; consider β-blocker if symptomatic, calcium channel blocker if β-blockers contraindicated
Premature Beats

- premature atrial contraction
  - ectopic supraventricular beat originating in the atria
  - P wave morphology of the PAC usually differs from that of a normal sinus beat
- junctional premature beat
  - ectopic supraventricular beat that originates in the vicinity of the AV node
  - P wave is usually not seen or an inverted P wave is seen and may be before or closely follow the QRS complex (referred to as a retrograde, or “traveling backward” P wave)
- treatment usually not required

Atrial Flutter

- rapid, regular atrial depolarization from a macro re-entrant circuit within the atrium (most commonly the right atrium)
- atrial rate 250-350 bpm, usually 300 bpm
- AV block usually occurs; it may be fixed (2:1, 3:1, 4:1, etc.) or variable
- etiology: CAD, thyrotoxicosis, mitral valve disease, cardiac surgery, COPD, PE, pericarditis
- ECG: sawtooth flutter waves (most common type of flutter) in inferior leads (II, III, aVF); narrow QRS (unless aberrancy); commonly see HR of 150
- in atrial flutter with 2:1 block, carotid sinus massage (first check for bruits), Valsalva maneuver, or adenosine may decrease AV conduction and bring out flutter waves
- treatment of acute atrial flutter
  - acute and if unstable (e.g. hypotension, CHF, angina): electrical cardioversion
  - if unstable (e.g. hypotension, CHF, angina): electrical cardioversion
  - if stable
    1. rate control: β-blocker, diltiazem, verapamil, or digoxin
    2. chemical cardioversion: sotalol, amiodarone, type I antiarrhythmics, or electrical cardioversion
- anticoagulation guidelines same as for patients with AFib
- treatment of long-term atrial flutter: antiarrhythmics, catheter radiofrequency (RF) ablation (success rate dependent on site of origin of atrial flutter – i.e. whether right-sided isthmus-dependent or left-sided origin)

Multifocal Atrial Tachycardia (MAT)

- irregular rhythm caused by presence of 3 or more atrial foci (may mimic AFib)
- atrial rate 100-200 bpm – 3 or more distinct P wave morphologies and PR intervals vary, some P waves may not be conducted
- occurs more commonly in patients with COPD, and hypoxemia; less commonly in patients with hypokalemia, hypomagnesemia, sepsis, theophylline, or digitalis toxicity
- treatment: treat the underlying cause; calcium channel blockers may be used (e.g. diltiazem, verapamil), β-blockers may be contraindicated because of severe pulmonary disease
- no role for electrical cardioversion, antiarrhythmics, or ablation

Atrial Fibrillation

- see CCS Atrial Fibrillation Guidelines 2014 for details (free mobile app – iCCS available on iOS and Android)
- most common sustained arrhythmia
- incidence increases with age (10% of population >80 yr old)
- symptoms: palpitations, fatigue, syncope, may precipitate or worsen heart failure
- classification
  - chronic/permanent: continuous AFib that is unresponsive to cardioversion; cardioversion should not be reattempted
  - lone: occurs in persons younger than 60 yr and in whom no clinical or echocardiographic causes are found
  - nonvalvular: not caused by valvular disease, prosthetic heart valves, or valve repair
  - paroxysmal: episodes that terminate spontaneously
  - persistent: AFib sustained for more than 7 d or AFib that terminates only with cardioversion
  - recurrent: two or more episodes of AFib
  - secondary: caused by a separate underlying condition or event (e.g. myocardial infarction, cardiac surgery, pulmonary disease, hyperthyroidism)
  - may be associated with thromboembolic events (stroke risk can be assessed by CHADS2 score in nonvalvular AFib)
- initiation
  - single circuit re-entry and/or ectopic foci act as aberrant generators producing atrial tachycardia (350-600 bpm)
  - impulses conduct irregularly across the atrial myocardium to give rise to fibrillation
  - in some cases, ectopic foci have also been mapped to the pulmonary vein ostia and can be ablated

Figure 25. Atrial flutter with variable block

Atrial Fibrillation – AFFIRM Trial
NEJM 2002;347:1825-1833
Study: Randomized, multicentre trial with mean follow-up of 3.5 yr.
Population: 4,060 patients (mean age 70 yr, 61% male, 89% white) with AF and a high risk of stroke or death.
Intervention: Rate control (β-blockers, calcium channel blockers, or digoxin alone or in combination) vs. rhythm control (antithyrrhythmic drug chosen by the treating physician).
Primary Outcome: All cause mortality.
Results: There was no difference in mortality or disabling stroke, anoxic encephalopathy, major bleeding, and cardiac arrest between the two groups. There were more incidents of hospitalizations (0.1% vs. 7%, p<0.001) and adverse events (Torsades de Pointes (12 vs. 2, p=0.007), pulseless or bradycardic arrest (9 vs. 1, p=0.01), pulmonary event (108 vs. 24, p<0.001), gastrointestinal event (117 vs. 35, p<0.001), prolonged QT interval (51 vs 4, p<0.001), bradycardia (105 vs. 64, p=0.001) in the rhythm-control group.
Conclusion: Rate-control was as effective as rhythm-control in AF and was better tolerated. There were more hospitalization incidents in the rhythm-control group.
Maintenance
- The tachycardia causes atrial structural and electrophysiological remodelling changes that further promote Afib; the longer the patient is in Afib the more difficult it is to convert back to sinus rhythm

Consequences
- The AV node irregularly filters incoming atrial impulses producing an irregular ventricular response of <200 bpm and the tachycardia leads to suboptimal cardiac output
- Fibrillatory conduction of the atria promotes blood stasis increasing the risk of thrombus formation – Afib is an important risk factor for stroke

Wide QRS complexes due to aberrancy may occur following a long-short cycle sequence if: 
- No organized P waves due to rapid atrial activity (350-600 bpm) causing a chaotic Afib on ECG
- Irregularly irregular ventricular response (typically 100-180 bpm), narrow QRS (unless aberrancy or previous BBB)
- Wide QRS complexes due to aberrancy may occur following a long-short cycle sequence (‘Ashman phenomenon’)
- Loss of atrial contraction, thus no “a” wave seen in JVP, no S4 on auscultation

Table 5. CHADS2 Risk Prediction for Non-Valvular Afib and Refer to AHA/ACC/HRS Afib Guidelines 2014 for more details

AFib on ECG
- No organized P waves due to rapid atrial activity (350-600 bpm) causing a chaotic fibrillatory baseline
- Irregularly irregular ventricular response (typically 100-180 bpm), narrow QRS (unless aberrancy or previous BBB)
- Wide QRS complexes due to aberrancy may occur following a long-short cycle sequence (“Ashman phenomenon”)
- Loss of atrial contraction, thus no “a” wave seen in JVP, no S4 on auscultation

Management (adapted from CCS Atrial Fibrillation Guidelines 2012 & 2014)

1. Rate control: β-blockers, diltiazem, verapamil (in patients with heart failure: digoxin, amiodarone)
2. Anticoagulation: use either warfarin or direct oral anticoagulant (DOACs) e.g. apixaban, dabigatran, rivaroxaban to prevent thromboembolism
3. Cardioversion (electrical)
   - If Afib <24-48 h, can usually cardiovert without anticoagulation
   - If Afib >24-48 h, anticoagulate for 3 wk prior and 4 wk after cardioversion due to risk of unstable intra-atrial thrombus
   - If patient unstable (hypotensive, active angina due to tachycardia, uncontrolled heart failure) should cardiovert immediately
4. Etiology
   - HTN, CAD, valvular disease, pericarditis, cardiomyopathy, myocarditis, ASD, post-operative, PE, COPD, thyrotoxicosis, sick sinus syndrome, alcohol (“holiday heart”)
   - May present in young patients without demonstrable disease (“lone Afib”) and in the elderly without underlying heart disease

Additional Management Points Regarding Afib
- Studies of patients with Afib suggest that there is no difference in long-term survival when treating patients with a rhythm-control versus rate-control strategy
- However, many patients with a significant underlying structural heart lesion (e.g. valve disease, cardiomyopathy) will not tolerate Afib well (since may be dependent on atrial kick) and these patients should be cardioverted (chemical or electrical) as soon as possible
Newly Discovered AFib
- anticoagulants may be beneficial if high risk for stroke
- if the episode is self-limited and not associated with severe symptoms, no need for antiarrhythmic drugs
- if AFib persists, 2 options
  1. rate control and anticoagulation (as indicated above)
  2. cardioversion (as above)

Recurrent AFib/Permanent AFib
- if episodes are brief or minimally symptomatic, antiarrhythmic drugs may be avoided; rate control and anticoagulation are appropriate
- patients who have undergone at least one attempt to restore sinus rhythm may remain in AFib after recurrence; permanent AFib may be accepted (with rate control and antithrombotics as indicated by CHADS2 score) in certain clinical situations
- if symptoms are bothersome or episodes are prolonged, antiarrhythmic drugs should be used
  - no or minimal heart disease: flecainide, propafenone, or sotalol
  - LV dysfunction: amiodarone
  - CAD: β-blockers, amiodarone

AV Nodal Re-Entrant Tachycardia (AVNRT)
- re-entrant circuit using dual pathways (fast conducting β-fibres and slow conducting α-fibres) within or near the AV node; often found in the absence of structural heart disease – cause is commonly idiopathic, although familial AVNRT has been reported
- sudden onset and offset
- fast regular rhythm: rate 150-250 bpm
- usually initiated by a supraventricular or ventricular premature beat
- AVNRT accounts for 60-70% of all paroxysmal SVTs
- retrograde P waves may be seen but are usually lost in the QRS complex (see Figure 27)
- treatment
  - acute: Valsalva or carotid massage, adenosine is first choice if unresponsive to vagal maneuvers; if no response, try metoprolol, digoxin, diltiazem, electrical cardioversion if patient hemodynamically unstable (hypotension, angina, or CHF)
  - long-term: 1st line – β-blocker, diltiazem, digoxin; 2nd line – flecainide, propafenone; 3rd line – catheter ablation

Figure 27. AVNRT

Figure 28. Mechanism for AVNRT

Figure 29. Accessory pathway conduction in WPW. Early ventricular activation leads to the appearance of a delta wave (slurred upstroke of the QRS) on the ECG before usual conduction across the AV node
Pre-Excitation Syndromes

• refers to a subset of SVTs mediated by an accessory pathway which can lead to ventricular pre-excitation

Wolff-Parkinson-White Syndrome
• congenital defect present in 1.5-2/1,000 of the general population
• an accessory conduction tract (Bundle of Kent; can be in right or left atrium) abnormally allows early electrical activation of part of one ventricle
• impulses travel at a greater conduction velocity across the Bundle of Kent thereby effectively "bypassing" AV node
• since the ventricles are activated earlier, the ECG shows early ventricular depolarization in the form of initial slurring of the QRS complex – the so-called "delta wave"
• atrial impulses that conduct to the ventricles through both the Bundle of Kent and the normal AV node/His-Purkinje system generate a broad “fusion complex”
• ECG features of WPW
  - PR interval <120 msec
  - delta wave: slurred upstroke of the QRS (the leads with the delta wave vary with site of bypass)
  - widening of the QRS complex due to premature activation
  - secondary ST segment and T wave changes
  - tachyarrhythmias may occur – most often AVRT and Afib

Afib in WPW Patients
• Afib is the index arrhythmia in up to 20% of patients with WPW syndrome
  - it is usually intermittent rather than persistent or permanent
• rapid atrial depolarizations in Afib are conducted through the bypass tract which is not able to filter impulses like the AV node can
• consequently the ventricular rate becomes extremely rapid (>200 bpm) and the QRS complex widens
• treatment: electrical cardioversion, IV procainamide, or IV amiodarone
  - do not use drugs that slow AV node conduction (digoxin, β-blockers) as this may cause preferential conduction through the bypass tract and precipitate VF
  - long-term: ablation of bypass tract if possible

AV Re-Entrant Tachycardia
• re-entrant loop via accessory pathway and normal conduction system
• initiated by a premature atrial or ventricular complex
• orthodromic AVRT: stimulus from a premature complex travels up the bypass tract (V to A) and down the AV node (A to V) with narrow QRS complex (no delta wave because stimulus travels through normal conduction system)
• comprises 95% of the reentrant tachycardias associated with WPW syndrome
• antidromic AVRT: more rarely the stimulus goes up the AV node (V to A) and down the bypass tract (A to V); wide and abnormal QRS as ventricular activation is only via the bypass tract
• treatment
  - acute: similar to AVNRT except avoid long-acting AV nodal blockers (e.g. digoxin and verapamil)
  - long-term: for recurrent arrhythmias ablation of the bypass tract is recommended
    - drugs such as flecainide and procainamide can be used

Ventricular Tachyarrhythmias

Premature Ventricular Contraction (PVC) or Ventricular Premature Beat (VPB)
• QRS width >120 msec, no preceding P wave, bizarre QRS morphology
• origin: LBBB morphology of VT = RV origin; RBBB morphology of VT = LV origin
• PVCs may be benign but are usually significant in the following situations
  - consecutive (≥3 = VT) or multiform (varied origin)
  - PVC falling on the T wave of the previous beat (“R on T phenomenon”): may precipitate ventricular tachycardia or VF

Accelerated Idioventricular Rhythm
• ectopic ventricular rhythm with rate 50-100 bpm
• more frequently occurs in the presence of sinus bradycardia and is easily overdriven by a faster supraventricular rhythm
• frequently occurs in patients with acute MI or other types of heart disease (cardiomyopathy, hypertensive, valvular) but it does not affect prognosis and does not usually require treatment
Ventricular Tachycardia (VT)

- 3 or more consecutive ectopic ventricular complexes
  - rate >100 bpm (usually 140-200)
  - ventricular flutter: if rate >200 bpm and complexes resemble a sinusoidal pattern
  - "sustained VT" if it lasts longer than 30 s
- ECG characteristics: wide regular QRS tachycardia (QRS usually >140 msec)
- AV dissociation; bizarre QRS pattern
- also favour Dx of VT: left axis or right axis deviation, nonspecific intraventricular block pattern, monophasic or biphasic QRS in V1 with RBBB, QRS concordance in V1-V6
- occasionally during VT supraventricular impulses may be conducted to the ventricles generating QRS complexes with normal or aberrant supraventricular morphology ("ventricular capture") or summation pattern ("fusion complexes")

- monomorphic VT
  - identical complexes with uniform morphology
  - more common than polymorphic VT
  - typically result from intraventricular re-entry circuit
  - potential causes: chronic infarct scarring, acute MI/ischemia, cardiomyopathies, myocarditis, arrhythmogenic right ventricular dysplasia, idiopathic, drugs (e.g. cocaine), electrolyte disturbances

- polymorphic VT
  - complexes with constantly changing morphology, amplitude, and polarity
  - more frequently associated with hemodynamic instability due to faster rates (typically 200-250 bpm) vs. monomorphic VT
  - potential causes: acute MI, severe or silent ischemia, and predisposing factors for QT prolongation

- treatment
  - sustained VT (>30 s) is an emergency, requiring immediate treatment
  - hemodynamic compromise: electrical cardioversion
  - no hemodynamic compromise: electrical cardioversion, lidocaine, amiodarone, type Ia agents (procaainamide, quinidine)

Figure 32. Ventricular tachycardia (monomorphic)

*If patient >65 yr and previous MI or structural heart disease, then chance of VT >95%

**May terminate VT in some patients with no structural heart disease

Torsades de Pointes

- a variant of polymorphic VT that occurs in patients with baseline QT prolongation – "twisting of the points"
- looks like usual VT except that QRS complexes "rotate around the baseline" changing their axis and amplitude
- ventricular rate >100 bpm, usually 150-300 bpm
- etiology: predisposition in patients with prolonged QT intervals
  - congenital long QT syndromes
  - drugs: e.g. class IA (quinidine), class III (sotalol), phenothiazines (TCAs), erythromycin, quinolones, antihistamines
  - electrolyte disturbances: hypokalemia, hypomagnesemia
  - nutritional deficiencies causing above electrolyte abnormalities
- treatment: IV magnesium, temporary pacing, isoproterenol and correct underlying cause of prolonged QT, electrical cardioversion if hemodynamic compromise

Arrhythmias that May Present as a Wide QRS Tachycardia

- VT
- SVT with aberrant conduction (rate related)
- SVT with preexisting BBB or nonspecific intraventricular conduction defect
- AV conduction through a bypass tract in WPW patients during an atrial tachyarrhythmia (e.g. atrial flutter, atrial tachycardia)
- Antidromic AVRT in WPW patients (see Pre-Excitation Syndromes, C21)
**Electrophysiology Studies**

- invasive test for the investigation and treatment of cardiac rhythm disorders using intracardiac catheters
- provide detailed analysis of the arrhythmia mechanism and precise site of origin when ECG data are nondiagnostic or unobtainable
- bradycardias: define the mechanisms of SA node dysfunction and localize site of AV conduction block
- tachyarrhythmias: map for possible ablation or to assess inducibility of VT

**Electrical Pacing**

- the decision to implant a pacemaker usually is based on symptoms of a bradyarrhythmia or tachyarrhythmia in the setting of heart disease

**Pacemaker Indications**

- SA node dysfunction (most common): symptomatic bradycardia ± hemodynamic instability
- common manifestations include: syncope, presyncope, or severe fatigue
- SA nodal dysfunction is commonly caused by: intrinsic disease within the SA node (e.g. idiopathic degeneration, fibrosis, ischemia, or surgical trauma), abnormalities in autonomic nervous system function, and drug effects
- AV nodal-infranodal block: Mobitz II, complete heart block

**Pacemaker Complications**

- complications related to surgical implantation include venous access (pneumothorax, hemothorax, air embolism), pacemaker leads (perforation, malposition), pocket hematomas and infection
- complications specific to the pacemaker include a failure to pace, failure to sense, pulse generator failure, pacemaker syndrome and pacemaker mediated tachycardia

**Pacing Techniques**

- temporary: transvenous (jugular, subclavian, femoral) or external (transcutaneous) pacing
- permanent: transvenous into RA, apex of RV, or both
- new generation: rate responsive, able to respond to physiologic demand
- biventricular

**Implantable Cardioverter Defibrillators**

- sudden cardiac death (SCD) usually results from ventricular fibrillation (VFib), sometimes preceded by monomorphic or polymorphic ventricular tachycardia (VT)
- ICDs detect ventricular tachyarrhythmias and are highly effective in terminating VT/VFib and in aborting SCD
- mortality benefit vs. antiarrhythmics in secondary prevention
- benefit seen in patients with ischemic and non-ischemic cardiomyopathy, depressed left ventricular ejection fraction (LVEF), prolonged QRS
- see *Heart Failure*, C36 for current treatment recommendations
Catheter Ablation

Techniques
- Radiofrequency (RF) ablation: a low-voltage high-frequency form of electrical energy (similar to cautery); RF ablation produces small, homogeneous, necrotic lesions approximately 5-7 mm in diameter and 3-5 mm in depth.
- Cryoablation: new technology which uses a probe with a tip that can decrease in temperature to -20°C and -70°C. Produces small, necrotic lesions similar to RF ablation; when brought to -20°C, the catheter tip reversibly freezes the area; bringing the tip down to -70°C for 5 min permanently scars the tissue.
- Advantage: can “test” areas before committing to an ablation.
- Disadvantage: takes much longer than RF (5 min per cryoablation vs. 1 min per RF ablation).

Indications
- Paroxysmal SVT: AVNRT accounts for more than half of all cases.
- Accessory pathway (orthodromic reciprocating tachycardia): 30% of SVT.
- Corrected by targeting the accessory pathway.
- Atrial flutter: reentry pathway in right atrium.
- AFib: potential role for pulmonary vein ablation.
- Ventricular tachycardia: focus arises from the right ventricular outflow tract and less commonly originates in the inferoseptal left ventricle near the apex (note: majority of cases of VT are due to scarring from previous MI and cannot be ablated).

Major Complications
- 1% of patients.
- Death: 0.1-0.2%.
- Cardiac: high grade AV block requiring permanent pacemaker (less risk with cryoablation), tamponade, pericarditis.
- Vascular: hematoma, vascular injury, thromboembolism, TIA/stroke.
- Pulmonary: PE.

Ischemic Heart Disease

Epidemiology
- Most common cause of cardiovascular morbidity and mortality.
- Canadian-led INTERHEART study showed that 9 modifiable risk factors accounted for >90% of MI.
- Atherosclerosis and thrombosis are the most important pathogenetic mechanisms.
- M:F = 2:1 with all age groups included (Framingham study), 8:1 for age <40, 1:1 for age >70.
- According to the Framingham Heart Study, men develop coronary heart disease at a rate double that of women for age <60; incidence in women triples shortly after menopause.
- Peak incidence of symptomatic IHD is age 50-60 (men) and 60-70 (women).
- For primary prevention of ischemic heart disease see Family Medicine, FM7.

* Major risk factor
Chronic Stable Angina

Definition
- Symptom complex resulting from an imbalance between oxygen supply and demand in the myocardium

Etiology and Pathophysiology
- Factors that decrease myocardial oxygen supply
  - Decreased luminal diameter: atherosclerosis, vasospasm
  - Decreased duration of diastole: tachycardia (decreased duration of diastolic coronary perfusion)
  - Decreased hemoglobin: anemia
  - Decreased \( \text{SaO}_2 \): hypoxemia
  - Congenital anomalies
- Factors that increase myocardial oxygen demand
  - Increased heart rate: hyperthyroidism
  - Increased contractility: hyperthyroidism
  - Increased wall stress: myocardial hypertrophy, aortic stenosis

Signs and Symptoms
- Typical: (1) retrosternal chest pain, tightness or discomfort radiating to left (± right) shoulder/arm/neck/jaw, associated with diaphoresis, nausea, anxiety; (2) predictably precipitated by the "3 Es": exertion, emotion, eating; (3) brief duration, lasting <10-15 min and typically relieved by rest and nitrates
- Atypical/probable angina (meets 2 of the above); non-cardiac chest pain (meets <1 of the above)
- Levine’s sign: clutching fist over sternum when describing chest pain
- Anginal equivalents: dyspnea, acute LV failure, flash pulmonary edema

Clinical Assessment
- History including directed risk factor assessment and physical exam
- Labs: Hb, fasting glucose, fasting lipid profile
- ECG (at rest and during episode of chest pain if possible)
- CXR (suspected heart failure, valvular disease, pericardial disease, aortic dissection/aneurysm, or signs or symptoms of pulmonary disease)
- Stress testing (see Stress Testing, C13) or angiography
- Echo
- To assess systolic murmur suggestive of aortic stenosis, mitral regurgitation, and/or HCM
- To assess LV function in patients with Hx of prior MI, pathological Q waves, signs or symptoms of CHF

Differential Diagnosis
- See Differential Diagnosis of Common Presentations, C4
Treatment of Chronic Stable Angina
1. General Measures
   - goals: to reduce myocardial oxygen demand and/or increase oxygen supply
   - lifestyle modification (diet, exercise)
   - treatment of risk factors: statins (see Endocrinology, E2, Family Medicine, FM9 for target lipid guidelines), antihypertensives, etc.
   - pharmacological therapy to stabilize the coronary plaque to prevent rupture and thrombosis
2. Antiplatelet Therapy (first-line therapy)
   - ASA
   - clopidogrel when ASA absolutely contraindicated
3. β-blockers (first-line therapy – improve survival in patients with hypertension)
   - increase coronary perfusion and decrease demand (HR, contractility) and BP (afterload)
   - cardioselective agents preferred (e.g. metoprolol, atenolol) to avoid peripheral effects (inhibition of vasodilation and bronchodilation via β2 receptors)
   - avoid intrinsic sympathomimetics (e.g. acebutolol) which increase demand
4. Nitrates (symptomatic control, no clear impact on survival)
   - decrease preload (venous dilatation) and afterload (arteriolar dilatation), and increase coronary perfusion
   - maintain daily nitrate-free intervals to prevent tolerance (tachyphylaxis)
5. Calcium Channel Blockers (CCBs, second-line or combination)
   - increase coronary perfusion and decrease demand (HR, contractility) and BP (afterload)
   - caution: verapamil/diltiazem combined with β-blockers may cause symptomatic sinus bradycardia or AV block
6. ACE Inhibitors (ACEI, not used to treat symptomatic angina)
   - angina patients tend to have risk factors for CV disease which warrant use of an ACEI (e.g. HTN, DM, proteinuric renal disease, previous MI with LV dysfunction)
   - benefit in all patients at high risk for CV disease (concomitant DM, renal dysfunction, or LV systolic dysfunction)
   - angiotensin II receptor blockers (ARBs) can be used when ACEI contraindicated; avoid combining ACEI and ARB (e.g. hypersensitivity, angioedema)
7. Invasive Strategies
   - revascularization (see Coronary Revascularization, C33 and COURAGE trial sidebar)

VARIANT ANGINA (Prinzmetal’s Angina)
- myocardial ischemia secondary to coronary artery vasospasm, with or without atherosclerosis
- uncommonly associated with infarction or LV dysfunction
- typically occurs between midnight and 8 am, unrelated to exercise, relieved by nitrates
- typically ST elevation on ECG
- diagnosed by provocative testing with ergot vasoconstrictors (rarely done)
- treat with nitrates and CCBs

SYNDROME X
- typical symptoms of angina but normal angiogram
- may show definite signs of ischemia with exercise testing
- thought to be due to inadequate vasodilator reserve of coronary resistance vessels
- better prognosis than overt epicardial atherosclerosis

Acute Coronary Syndromes

Definition
- ACS includes the spectrum of UA, NSTEMI, and STEMI; this distinction aids in providing the appropriate therapeutic intervention
- MI is defined by evidence of myocardial necrosis. It is diagnosed by a rise/fall of serum markers plus any one of
  - symptoms of ischemia (chest/upper extremity/mandibular/epigastric discomfort; dyspnea)
  - ECG changes (ST-T changes, new BBB or pathological Q waves)
  - imaging evidence (myocardial loss of viability, wall motion abnormality, or intracoronary thrombus)
- if biomarker changes are unattainable, cardiac symptoms combined with new ECG changes is sufficient
- NSTEMI meets criteria for myocardial infarction without ST elevation or BBB
- STEMI meets criteria for myocardial infarction characterized by ST elevation or new BBB
• UA is clinically defined by any of the following:
  ▪ accelerating pattern of pain: increased frequency, increased duration, decreased threshold of exertion, decreased response to treatment
  ▪ angina at rest
  ▪ new-onset angina
  ▪ angina post-MI or post-procedure (e.g. percutaneous coronary intervention [PCI], coronary artery bypass grafting [CABG])

Investigations
• history and physical
  ▪ note that up to 30% of MIs are unrecognized or “silent” due to atypical symptoms – more common in women, DM, elderly, post-heart transplant (because of denervation)
• ECG
• CXR
• labs
  ▪ serum cardiac biomarkers for myocardial damage (repeat 8 h later) (see Cardiac Biomarkers, C11)
  ▪ CBC, INR/PTT, electrolytes and magnesium, creatinine, urea, glucose, serum lipids
  ▪ draw serum lipids within 24-48 h because values are unreliable from 2-48 d post-MI

MANAGEMENT OF ACUTE CORONARY SYNDROMES

1. General Measures
• ABCs: assess and correct hemodynamic status first
• bed rest, cardiac monitoring, oxygen
• nitroglycerin SL followed by IV
• morphine IV

2. Anti-Platelet and Anticoagulation Therapy
• see also CCS Antiplatelet Guidelines 2012 for details (free mobile apps available on iOS and Android platforms in the CCS app stores)
• ASA chewed
• NSTEMI
  ▪ ticagrelor in addition to ASA or if ASA contraindicated, subcutaneous low molecular weight heparin or IV unfractionated heparin (UFH) (LMWH preferable, except in renal failure or if CABG is planned within 24 h)
  ▪ clopidogrel used if patient ineligible for ticagrelor
• if PCI is planned: ticagrelor or prasugrel and consider IV GP IIb/IIIa inhibitor (e.g. abciximab)
  ▪ clopidogrel used if patient ineligible for ticagrelor and prasugrel
• prasugrel contraindicated in those with a history of stroke/TIA, and avoidance of or lower dose is recommended for those >75 yr old or weighing under 60 kg (TRITON-TIMI 38)
• anticoagulation options depend on reperfusion strategy:
  ▪ primary PCI: UFH during procedure; bivalirudin is a possible alternative
  ▪ thrombolysis: LMWH (enoxaparin) until discharge from hospital; can use UFH as alternative because of possible rescue PCI
  ▪ no reperfusion: LMWH (enoxaparin) until discharge from hospital
• continue LMWH or UFH followed by oral anticoagulation at discharge if at high risk for thromboembolic event (large anterior MI, AFib, severe LV dysfunction, CHF, previous DVT or PE, or echo evidence of mural thrombus)

3. β-blockers
• STEMI: contraindications include signs of heart failure, low output states, risk of cardiogenic shock, heart block, asthma or airway disease; initiate orally within 24 h of diagnosis when indicated
• if β-blockers are contraindicated or if β-blockers/nitrates fail to relieve ischemia, non-dihydropyridine calcium channel blockers (e.g. diltiazem, verapamil) may be used as second-line therapy in the absence of severe LV dysfunction or pulmonary vascular congestion (calcium channel blockers do not prevent MI or decrease mortality)

4. Invasive Strategies and Reperfusion Options
• UA/NSTEMI: early coronary angiography ± revascularization if possible is recommended with any of the following high-risk indicators:
  ▪ recurrent angina/ischemia at rest despite intensive anti-ischemic therapy
  ▪ CHF or LV dysfunction
  ▪ hemodynamic instability
  ▪ high (≥3) TIMI risk score (tool used to estimate mortality following an ACS)
  ▪ sustained ventricular tachycardia
  ▪ dynamic ECG changes
  ▪ high-risk findings on non-invasive stress testing
PCI within the previous 6 mo
- repeated presentations for ACS despite treatment and without evidence of ongoing ischemia or high risk features
- note: thrombolysis is NOT administered for UA/NSTEMI

- STEMI
  - after diagnosis of STEMI is made, do not wait for results of further investigations before implementing reperfusion therapy
  - goal is to re-perfuse artery: thrombolysis (“EMS-to-needle”) within 30 min or primary PCI (“EMS-to-balloon”) within 90 min (depending on capabilities of hospital and access to hospital with PCI facility)
  - thrombolysis
    - preferred if patient presents ≤12 h of symptom onset, and <30 min after presentation to hospital, has contraindications to PCI, or PCI cannot be administered within 90 min
  - PCI
    - early PCI (≤12 h after symptom onset and <90 min after presentation) improves mortality vs. thrombolysis with fewer intra-cranial hemorrhages and recurrent MIs
    - primary PCI: without prior thrombolytic therapy – method of choice for reperfusion in experienced centres (JAMA 2004;291:736-739)
    - rescue PCI: following failed thrombolytic therapy (diagnosed when following thrombolysis, ST segment elevation fails to resolve below half its initial magnitude and patient still having chest pain)

**Long-Term Management of ACS**

- risk of progression to MI or recurrence of MI or death is highest within 1 mo
- at 1-3 mo after the acute phase, most patients resume a clinical course similar to that in patients with chronic stable coronary disease
- pre-discharge workup: ECG and echo to assess residual LV systolic function
- drugs required in hospital to control ischemia should be continued after discharge in all patients
- other medications for long-term management of ACS are summarized below

**1. General Measures**

- education
- risk factor modification
2. Antiplatelet and Anticoagulation Therapy
- see also CCS Antiplatelet Guidelines 2012 for details (free mobile apps available on iOS and Android platforms in the CCS app stores)
- ECASA 81 mg daily
- ticagrelor 90 mg twice daily or prasugrel 10 mg daily (at least 1 mo, up to 9-12 mo, if stent placed at least 12 mo)
- clopidogrel 75 mg daily can be used as alternatives to ticagrelor and prasugrel when indicated
- ± warfarin x 3 mo if high risk (large anterior MI, LV thrombus, LVEF <30%, history of VTE, chronic AFib)

3. β-Blockers (e.g. metoprolol 25-50 mg bid or atenolol 50-100 mg daily)

4. Nitrates
- alleviate ischemia but do not improve outcome
- use with caution in right-sided MI patients who have become preload dependent

5. Calcium Channel Blockers (NOT recommended as first line treatment, consider as alternative to β-blockers)

6. Angiotensin-Converting Enzyme Inhibitors
- prevent adverse ventricular remodelling
- recommended for asymptomatic high-risk patients (e.g. diabetics), even if LVEF >40%
- used for symptomatic CHF, reduced LVEF (<40%), anterior MI
- use ARBs in patients who are intolerant of ACEI; avoid combing ACE and ARB

7. ± Aldosterone Antagonists
- if on ACEI and β-blockers and LVEF <40% and CHF or DM
- significant mortality benefit shown with eplerenone by 30 d

8. Statins (early, intensive, irrespective of cholesterol level; e.g. atorvastatin 80 mg daily)

9. Invasive Cardiac Catheterization if indicated (risk stratification)

Figure 37. Post-MI risk stratification

Prognosis following STEMI
- 5-15% of hospitalized patients will die
  - risk factors
    - infarct size/severity
    - age
    - comorbid conditions
    - development of heart failure or hypotension
- post-discharge mortality rates
  - 6-8% within first year, half of these within first 3 mo
  - 4% per year following first yr
- risk factors
  - LV dysfunction
  - residual myocardial ischemia
  - ventricular arrhythmias
  - history of prior MI

Complication Etiology Presentation Therapy

**Treatment Algorithm for Chest Pain**

![Treatment Algorithm for Chest Pain](image)

**Enoxaparin vs. Unfractionated Heparin with Fibrinolysis for ST-elevation Myocardial Infarction**

**AEJM 2008;354:1477-1488**

**Study:** Prospective multicentre RCT.

**Patients:** 20,479 patients (median age 60 yr, 77% male) with STEMI who were scheduled to undergo fibrinolysis.

**Intervention:** Patients were randomized to receive either enoxaparin or weight based unfractionated heparin in addition to thrombolysis and standard therapies.

**Primary Outcome:** Death or recurrent nonfatal MI 30 d post event.

**Results:** The composite primary outcome occurred less often in the enoxaparin group compared with those who received unfractionated heparin (9.9% vs. 12.0%, p=0.001; NNT=43). Taken separately, there was a trend toward reduced mortality (6.9% vs. 7.5%, p=0.11) and a significant reduction in nonfatal reinfarction (5.0% vs. 4.3%, p=0.001) in the enoxaparin group. The risk of major bleeding was significantly increased in the enoxaparin group (2.1% vs. 1.4%, p<0.001, NNI=142).

**Conclusion:** In patients with STEMI receiving thrombolysis, enoxaparin is superior to unfractionated heparin in preventing recurrent nonfatal MI and may lead to a small reduction in mortality.

**Intensive vs. Moderate Lipid Lowering with Statins after Acute Coronary Syndromes**

**AEJM 2004;350:1495-1504**

**Study:** Prospective, double blind, RCT; mean follow-up of 2 yr.

**Population:** 4,162 patients who had been hospitalized for an ACS within the preceding 10 d.

**Intervention:** Patients were randomized to receiving pravastatin 40 mg or atorvastatin 80 mg daily.

**Primary Outcome:** Composite of death from any cause, myocardial infarction, documented unstable angina requiring rehospitalization, revascularization (performed at least 30 d after randomization), and stroke.

**Results:** High dose atorvastatin was associated with a 16% hazard ratio reduction (p=0.005; 99% CI 5-26%) in the primary outcome compared to standard dose pravastatin.

**Conclusions:** In patients who recently experienced an ACS, high dose statin therapy provides greater protection against death and major cardiovascular events than standard dose therapy.

---

**Figure 38. Treatment algorithm for patients with symptoms suggestive of an acute coronary syndrome**

**Sudden Cardiac Arrest**

**Definition**
- unanticipated, non-traumatic cardiac death in a stable patient which occurs within 1 h of symptom onset; VFib is most common cause

**Etiology**
- primary cardiac pathology
  - ischemia/MI
  - LV dysfunction
  - severe ventricular hypertrophy
    - HCM
    - AS
  - congenital heart disease e.g. arrhythmogenic right ventricular dysplasia
  - mutations in cardiac ion channels e.g. long QT syndrome, Brugada syndrome

**Management**
- acute: resuscitate with prompt CPR and defibrillation
- investigate underlying cause (cardiac catheterization, electrophysiologic studies, echo)
- treat underlying cause
- antiarrhythmic drug therapy: amiodarone, β-blockers
- implantable cardioverter defibrillator (ICD)
- refer to ACLS guidelines (see Anesthesia, A33)

**Coronary Revascularization**

**PERCUTANEOUS CORONARY INTERVENTION**
- interventional cardiology technique aimed at relieving significant coronary stenosis
- main techniques: balloon angioplasty, stenting
- less common techniques: rotational/directional/extraction atherectomy

**Indications**
- medically refractory angina
- NSTEMI/UA with high risk features (e.g. high TIMI risk score)
- primary/rescue PCI for STEMI

**Balloon Angioplasty and Intracoronary Stenting**
- coronary lesions dilated with balloon inflation
- major complication is restenosis (approximately 15% at 6 mo), felt to be due to elastic recoil and neointimal hyperplasia
- majority of patients receive intracoronary stent(s) to prevent restenosis
  - bare metal stent (BMS) versus drug-eluting stents: FRAMI trial demonstrated stenting non-culprit lesions results in 14% absolute risk reduction of cardiac death, nonfatal MI, or refractory angina
  - coated with antiproliferative drugs (sirolimus, paclitaxel, everolimus)
  - reduced rate of neointimal hyperplasia and restenosis compared to BMS (5% vs. 20%)
- complication: late stent thrombosis (5 events per 1,000 stents implanted)

**Adjunctive Therapies**
- ASA and heparin decrease post-procedural complications
- further reduction in ischemic complications has been demonstrated using GPIIb/IIIa inhibitors (abciximab, eptifibatide, tirofiban) in coronary angiography and stenting
- following stent implantation
  - dual antiplatelet therapy (ASA and clopidogrel) for 1 mo with BMS or ≥12 mo with DES
  - DAPT study showed benefit of dual antiplatelet therapy beyond 12 mo
  - ASA and prasugrel can be considered for those at increased risk of stent thrombosis

**Procedural Complications**
- mortality and emergency bypass rates <1%
- nonfatal MI: approximately 2-3%

**CORONARY ARTERY BYPASS GRAFT SURGERY**
- objective of CABG is complete reperfusion of the myocardium
Indications
- **CABG**
  - ≥50% diameter stenosis in the left main coronary artery
  - ≥70% diameter stenosis in three major coronary arteries
  - ≥70% diameter stenosis in the proximal LAD artery plus one other major coronary artery
  - survivors of sudden cardiac arrest with presumed ischemia-mediated VT caused by significant (≥70% diameter) stenosis in a major coronary artery
- **other**
  - ≥70% diameter stenosis in two major coronary arteries (without proximal LAD disease) and evidence of extensive ischemia
  - ≥70% diameter stenosis in the proximal LAD artery and evidence of extensive ischemia
  - LV systolic dysfunction (LVEF 35% to 50%) and significant multivessel CAD or proximal LAD stenosis where viable myocardium is present in the region of intended revascularization
- **PCI**
  - UA/NSTEMI if not a CABG candidate
  - STEMI when PCI can be performed more rapidly and safely than CABG
  - CABG or PCI
  - one or more significant (≥70% diameter) coronary artery stenosis amenable to revascularization and unacceptable angina despite medical therapy

<table>
<thead>
<tr>
<th>Graft</th>
<th>Occlusion/Patency Rate</th>
<th>Considerations</th>
</tr>
</thead>
<tbody>
<tr>
<td>Saphenous Vein Grafts (SVG)</td>
<td>At 10 yr, 50% occluded, 25% stenotic, 25% angiographically normal</td>
<td>Used when arterial grafts are not available or many grafts are required, such as triple or quadruple bypass</td>
</tr>
<tr>
<td>Left Internal Thoracic/Mammary Artery (LITA/LIMA) (LIMA to LAD)</td>
<td>90-95% patency at 15 yr</td>
<td>Most preferred option because of excellent patency, improved event-free survival (angina, MI), decreased late cardiac events, no increase in operative risk</td>
</tr>
<tr>
<td>Right Internal Thoracic/Mammary Artery (RITA/RIMA)</td>
<td>Pedicled RIMA patency comparable to LIMA, Free RIMA patency less</td>
<td>Used in bilateral ITA/IMA grafting, patients receiving bilateral ITAs/IMAs have less risk of recurrent angina, late MI, angioplasty</td>
</tr>
<tr>
<td>Radial Artery (free graft)</td>
<td>85-90% patency at 5 yr</td>
<td>Prone to severe vasospasm post-operatively due to muscular wall</td>
</tr>
<tr>
<td>Right Gastroepiploico Artery</td>
<td>80-90% patency at 5 yr</td>
<td>Primarily used as an in situ graft to bypass the RCA, use limited because of the fragile quality of the artery, other technical issues, increased operative time (laparotomy incision), and incisional discomfort with associated ileus</td>
</tr>
</tbody>
</table>

**Complete Arterial Revascularization**
- For younger patients (<60 yr of age), is preferred due to longer term graft patency

**Redo Bypass Grafting**
- Operative mortality 2.3x higher than first operation 10% perioperative MI rate
- Recommeration undertaken only in symptomatic patients who have failed medical therapy and in whom angiography has documented progression of the disease
- Increased risk with redo-sternotomy secondary to adhesions which may result in laceration to aorta, RV, IMA/ITA, and other bypass grafts

**Percutaneous Coronary Intervention vs. Coronary-Artery Bypass Grafting for Severe Coronary Artery Disease: The SYNTAX Trial**
- **Study**: Prospective RCT.
- **Population**: 1,800 patients with untreated three-vessel or left main coronary artery disease and anatomically equivalent for both Percutaneous Intervention (PCI) and Coronary Artery Bypass Graft (CABG).
- **Intervention**: PCI vs. CABG.
- **Outcome**: Composite of death from any cause, stroke, MI, or repeat revascularization in 12 mo post-intervention.
- **Results**: Incidence of primary outcome was lower in the CABG intervention vs. PCI (12.4% vs. 17.1%, p=0.002, NNT=19). PCI was associated with significantly higher rates of repeat revascularization (13.5% vs. 5.9%, p<0.001) and cardiac death (3.7% vs. 2.1%, p=0.05), while CABG had higher rates of stroke (2.2% vs. 0.6%, p=0.03).
- **Conclusions**: In patients with three-vessel or left main coronary artery disease, CABG is superior to PCI in preventing major adverse cardiovascular and cerebrovascular events within 12 mo of intervention.
Operative Issues

- left ventricular (LV) function is an important determinant of outcome of all heart diseases
- patients with severe LV dysfunction usually have poor prognosis, but surgery can sometimes dramatically improve LV function
- assess viability of non-functioning myocardial segments in patients with significant LV dysfunction using delayed thallium myocardial imaging, stress echocardiography, PET scanning, or MRI

**CABG and Antiplatelet Regimens**

- please refer to CCS guidelines – 2012 update on antiplatelet therapy – for more information if possible
- prior to CABG, clopidogrel and ticagrelor should be discontinued for 5 d and prasugrel for 7 d before surgery
- dual antiplatelet therapy should be continued for 12 mo in patients with ACS within 48-72 h after CABG
- ASA (81 mg) continued indefinitely (can be started 6 h after surgery)
- patients requiring CABG after PCI should continue their dual antiplatelet therapy as recommended in the post-PCI guidelines

### Table 12. Risk Factors for CABG Mortality and Morbidity (decreasing order of significance)

### Procedural Complications

- CABG using cardiopulmonary bypass (CPB)
  - stroke and neurocognitive defects (microembolization of gaseous and particulate matter)
  - immunosuppression
  - systemic inflammatory response leading to
    - myocardial dysfunction
    - renal dysfunction
    - neurological injury
    - respiratory dysfunction
    - coagulopathies

### OFF-PUMP CORONARY ARTERY BYPASS SURGERY

**Procedure**

- avoids the use of CPB by allowing surgeons to operate on a beating heart
  - stabilization devices (e.g. Genzyme Immobilizer) hold heart in place allowing operation while positioning devices (Medtronic Octopus® and Starfish® system) allow the surgeon to lift the beating heart to access the lateral and posterior vessels
  - procedure is safe and well tolerated by most patients; however, this surgery remains technically more demanding

**Indications**

- used in poor candidates for CPB who have: calcified aorta, poor LVEF, severe peripheral vascular disease (PVD), severe COPD, chronic renal failure, coagulopathy, transfusion objections (e.g. Jehovah’s Witness), good target vessels, anterior/lateral wall revascularization, target revascularization in older, sicker patients
- **absolute contraindications**: hemodynamic instability, poor quality target vessels including intramyocardial vessels, diffusely diseased vessels, and calcified coronary vessels
- **relative contraindications**: cardiomegaly/CHF, critical left main disease, small distal targets, recent or current acute MI, cardiogenic shock, LVEF <35%

**Outcomes**

- OPCAB decreases in-hospital morbidity (decreased incidence of chest infection, inotropic requirement, supraventricular arrhythmia), blood product transfusion, ICU stay, length of hospitalization, and CK-MB and troponin I levels
- no significant difference in terms of survival at 2 yr, frequency of cardiac events (MI, PCI, CHF, recurrent angina, redo CABG), or medication usage compared to on-pump CABG
Congestive Heart Failure

Low-Output HF
- Systolic Dysfunction
  - Injury and ischaemia in myocardium
  - Decreased cardiac output
- Diastolic Dysfunction
  - Ineffective ventricular filling

High-Output HF
- Systolic Dysfunction
  - Inflammation and fibrosis
  - Increased cardiac output
- Diastolic Dysfunction
  - Thickened myocardium

Increased Cardiac Workload
- Myocardial stress
- Volume overload
- Pressure overload

Compensation
- Increased heart rate
- Myocardial contractility
- Increased blood volume

Decompensation
- Deterioration of heart function
- Heart unable to maintain blood circulation

Systemic Response
- Activation of SNS and RAAS activity

ECG
Atrial fibrillation 3.8 (1.7-8.8)
Any abnormal finding 2.2 (1.0-4.1)

Dichotomies of Heart Failure
- Forward vs. backward
- Left-sided vs. right-sided
- Systolic vs. diastolic dysfunction
- Low output vs. high output

Use Ejection Fraction to Grade LV Dysfunction
- Grade I (EF > 60%) (Normal)
- Grade II (EF = 40-59%)
- Grade III (EF = 21-39%)
- Grade IV (EF ≤20%)
Pathophysiology
- most common causes are ischemic heart disease, hypertension and valvular heart disease
- myocardial insult causes pump dysfunction/impaired filling leading to myocardial remodelling
  - pressure overload (e.g. AS or HTN) leads to compensatory hypertrophy (concentric remodelling) and eventually interstitial fibrosis
  - volume overload (e.g. AI) leads to dilatation (eccentric remodelling)
- both processes lead to maladaptive changes contributing to disease process
- results in decreased volume cardiac output resulting in activation of the SNS and RAAS
- Na⁺ and water retention, increasing preload and afterload, tachycardia
- perpetuates cycle of increasing cardiac demand and decompensation

Heart Failure with Reduced Ejection Fraction
- impaired myocardial contractile function → decreased LVEF and SV → decreased CO

Volume Overload and Eccentric Remodeling is the Typical Phenotype
- findings: apex beat displaced, S3, cardiothoracic ratio >0.5, decreased LVEF, LV dilatation
- causes
  - ischemic (e.g. extensive CAD, previous MI)
  - non-ischemic
    - HTN
    - DM
    - alcohol (and other toxins)
    - myocarditis
    - dilated cardiomyopathy (multiple causes – see Dilated Cardiomyopathy, C42)

Heart Failure with Preserved Ejection Fraction
- previously known as “diastolic heart failure”
- concentric remodeling with a “stiff” left ventricle is the typical phenotype
- 1/2 of patients with heart failure have preserved EF; confers similar prognosis to HRoEF; more common in the elderly and females
- reduced LV compliance causes increased LV filling pressures, increased LA pressure/volume, and pulmonary congestion
- findings: HTN, apex beat sustained, S4, normal-sized heart on CXR, IVH on ECG/echo, normal EF
- causes
  - transient ischemia (relaxation of myocardium is active and requires ATP)
  - permanent
    - severe hypertrophy (HTN, aortic stenosis, HCM)
    - restrictive cardiomyopathy (e.g. amyloid)
    - MI

High-Output Heart Failure
- caused by demand for increased cardiac output
- often exacerbates existing heart failure or decompensates a patient with other cardiac pathology
- differential diagnosis: anemia, thiamine deficiency (beriberi), hyperthyroidism, A-V fistula or L-R shunting, Paget’s disease, renal disease, hepatic disease

Precipitants of Symptomatic Exacerbations
- consider natural progression of disease vs. new precipitant
- always search for reversible cause
- differential diagnosis can also be organized as follows
  - new cardiac insult/disease: MI, arrhythmia, valvular disease
  - new demand on CV system: HTN, anemia, thyrotoxicosis, infection, etc.
  - medication non-compliance
  - dietary indiscretion e.g. salt intake
  - obstructive sleep apnea

Investigations
- identify and assess precipitating factors and treatable causes of CHF
- blood work: CBC, electrolytes (including calcium and magnesium), BUN, creatinine, fasting blood glucose, HbA1c, lipid profile, liver function tests, serum TSH ± ferritin, BNP, uric acid
- ECG: look for chamber enlargement, arrhythmia, ischemia/infarction
- CXR: cardiomegaly, pleural effusion, redistribution, Kerley B lines, bronchial-alveolar cuffing
- echo: systolic function (LVEF), diastolic function (E/A ratio, E/e’), cardiac dimensions, wall motion abnormalities, RVSP (from TR jet), valvular disease, pericardial effusion
- radionuclide angiography: LVEF
- myocardial perfusion scintigraphy (thallium or sestamibi SPECT)
Acute Treatment of Pulmonary Edema
- treat acute precipitating factors (e.g. ischemia, arrhythmias)
- L – Lasix® (furosemide) 40-500 mg IV
- M – morphine 2-4 mg IV: decreases anxiety and preload (venodilation)
- N – nitroglycerin: topical/IV/SL - use with caution in preload-dependent patients (e.g. right HF or RV infarction) as it may precipitate CV collapse
- O – oxygen: in hypoxemic patients
- P – positive airway pressure (CPAP/BiPAP): decreases preload and need for ventilation when appropriate
- P – position: sit patient up with legs hanging down unless patient is hypotensive
- in ICU setting or failure of LMNOPP, other interventions may be necessary
  - nitroprusside IV
  - hydralazine PO
  - sympathomimetics
    - dopamine
      - low dose: selective renal vasodilation (high potency D1 agonist)
      - medium dose: inotropic support (medium potency β1 agonist)
      - high dose: increases SVR (low potency β1 agonist), which is undesirable
  - dobutamine
    - β1-selective agonist causing isotropy, tachycardia, hypotension (low dose) or hypertension (high dose); most serious side effect is arrhythmia, especially AF
  - phosphodiesterase inhibitors (milrinone)
    - inotropic effect and vascular smooth muscle relaxation (decreased SVR), similar to dobutamine
- consider pulmonary artery catheter to monitor pulmonary capillary wedge pressure (PCWP)
- if patient is unstable or a cardiac etiology is uncertain (PCWP >18 indicates likely cardiac etiology)
- mechanical ventilation as needed
- rarely used, but potentially life-saving measures:
  - intra-aortic balloon pump (IABP) - reduces afterload via systolic unloading and improves coronary perfusion via diastolic augmentation
  - left or right ventricular assist device (LVAD/RVAD)
  - cardiac transplant

Long-Term Management
- overwhelming majority of evidence-based management applies to HREF
- currently no proven pharmacologic therapies shown to reduce mortality in HFPEF; control risk factors (e.g. hypertension)

Conservative Measures
- symptomatic measures: oxygen in hospital, bedrest, elevate the head of bed
- lifestyle measures: diet, exercise, DM control, smoking cessation, decrease alcohol consumption, patient education, sodium and fluid restriction
- multidisciplinary heart failure clinics: for management of individuals at higher risk, or with recent hospitalization

Non-Pharmacological Management
- from CCS guidelines (2013 update)
- cardiac rehabilitation: participation in a structured exercise program for NYHA class I-III after clinical status assessment to improve quality of life (HF-ACTION trial)

Pharmacological Therapy

1. Renin-angiotensin-aldosterone blockade
  - ACEI: standard of care – slows progression of LV dysfunction and improves survival
  - all symptomatic patients functional class II-IV
  - all asymptomatic patients with LVEF <40%
  - post-MI
  - angiotensin II receptor blockers
    - second-line to ACEI if not tolerated, or as adjunct to ACEI if β-blockers not tolerated
    - combination with ACEI is not routinely recommended and should be used with caution as it may precipitate hyperkalemia, renal failure, the need for dialysis and increase (CHARM, ONTARGET)
  - combination angiotensin II receptor blockers with neprilysin inhibitors (ARNI) is a new class of medication that has morbidity and mortality benefit over ACE inhibitor alone; this may become standard first line therapy

2. β-blockers: slow progression and improve survival
  - class I-III with LVEF <40%
  - stable class IV patients
  - carvedilol improves survival in class IV HF (COMET)
  - note: should be used cautiously, titrate slowly because may initially worsen CHF
3. Mineralocorticoid receptor (aldosterone) antagonists: mortality benefit in symptomatic heart failure and severely depressed ejection fraction
   - spironolactone or eplerenone symptomatic heart failure in patients already on ACEI, beta blocker and loop diuretic
   - note: potential for life threatening hyperkalemia
   - monitor K+ after initiation and avoid if Cr >220 µmol/L or K+ >5.2 mmol/L

4. Diuretics: symptom control, management of fluid overload
   - furosemide (40-500 mg daily) for potent diuresis
   - metolazone may be used with furosemide to increase diuresis
   - furosemide, metolazone, and thiazides oppose the hyperkalemia that can be induced by β-blockers, ACEI, ARBs, and aldosterone antagonists

5. Digoxin and cardiac glycosides: digoxin improves symptoms and decreases hospitalizations, no effect on mortality
   - indications: patient in sinus rhythm and symptomatic on ACEI, or CHF and AFib
   - patients on digitalis glycosides may worsen if these are withdrawn

6. Antiarrhythmic drugs: for use in CHF with arrhythmia
   - can use amiodarone, β-blocker, or digoxin

7. Anticoagulants: warfarin for prevention of thromboembolic events
   - prior thromboembolic event or AFib, presence of LV thrombus on echo

Procedural Interventions
- resynchronization therapy: symptomatic improvement with biventricular pacemaker
- consider if QRS >150 msec, LVEF <35%, and persistent symptoms despite optimal therapy
- greatest benefit likely with marked LV enlargement, mitral regurgitation, QRS >150 msec,
- ICD: mortality benefit in 1st prevention of sudden cardiac death
- prior MI, optimal medical therapy, LVEF <30%, clinically stable
- prior MI, non-sustained VT, LVEF 30-40%, EPS inducible VT
- LVAD/RVAD (see Ventricular Assist Devices, C40)
- cardiac transplantation (see Cardiac Transplantation, C40)
- valve repair if patient is surgical candidate and has significant valve disease contributing to CHF (see Valvular Heart Disease, C4)

Sleep-Disordered Breathing
- 45-55% of patients with CHF have sleep disturbances, including Cheyne-Stokes breathing and sleep apnea (central or obstructive)
- associated with a worse prognosis and greater LV dysfunction
- nasal continuous positive airway pressure (CPAP) is effective in treating symptoms of sleep apnea with secondary beneficial effects in cardiac function and symptoms
Cardiac Transplantation

- treatment for end-stage heart disease; due to ischemic or non-ischemic cardiomyopathy
- worldwide 1 yr survival is 85-90%, 5 yr survival about 60%, annual mortality rate of 4%
- matching is according to blood type, body size and weight (should be within 25%), and HLA tissue matching (if time allows)

Indications for Surgery
- severe cardiac disability despite maximal medical therapy (e.g. recurrent hospitalizations for CHF, NYHA III or IV, peak metabolic oxygen consumption <14 mL/kg/min in absence of β-blocker)
- symptomatic cardiac ischemia refractory to conventional treatment (e.g. unstable angina not amenable to CABG or PCI with LVEF <30%; recurrent, symptomatic ventricular arrhythmias)
- exclusion of all surgical alternatives to cardiac transplantation

Prerequisites
- psychosocial stability
- medically compliant and motivated
- relative contraindications: incurable malignancy, major systemic illness, irreversible major organ disease, active systemic infection, obesity, irreversible pulmonary HTN (pulmonary vascular resistance [PVR] >6 Wood units), severe COPD (FEV1 <1 L) or active drug addiction or alcoholism

Complications
- rejection
  - common, <5% have serious hemodynamic compromise
  - gold standard to detect rejection: endomyocardial biopsy
  - risk of acute rejection is greatest during the first 3 mo after transplant
- infection
  - leading cause of morbidity and mortality after cardiac transplantation
  - risk peaks early during the first few months after transplantation and then declines to a low persistent rate
- allograft CAD
  - approximately 50% develop graft CAD within 5 yr of transplantation
  - most common cause of late death following transplantation
- malignancy
  - develops in 15% of cardiac transplant recipients due to immunosuppressive medication
  - second most common cause of late death following transplantation
- cutaneous neoplasms most common, followed by non-Hodgkin's lymphoma and lung cancer
- immunosuppressive medication side effects (prednisone, cyclosporine, tacrolimus, sirolimus)

Ventricular Assist Devices

- work to unload the ventricle while maintaining output; also results in decreased myocardial oxygen consumption permitting recovery of the myocardium that is not irreversibly injured
- can support the left (LVAD), right (RVAD), or both ventricles (BiVAD)
- indications
  - bridge to transplantation, bridge to decision (for transplant), or long term permanent therapy (“destination therapy”)
  - post-operative mechanical support when unable to separate from cardiopulmonary bypass despite inotropic and intra-aortic balloon pump (IABP) support
    - IABP is a catheter based device inserted into the femoral artery and advanced to the descending aorta that decreases myocardial O2 demand and increases blood flow to coronary arteries
  - inflation of the balloon occurs during diastole to increase ascending aorta and coronary artery perfusion pressure; deflation occurs at systole to reduce intra-aortic pressure thus reducing afterload
  - post-operative cardiogenic shock

REMATCH Trial
NEJM 2001;345:1435-1443
Increased survival of 23% vs. 8% with LVAD vs. medical management of heart failure after 2 yr. Heartmate VAD has a biologic surface therefore does not require long-term anticoagulation but appears to improve the clinical course of the heart allograft recipient.

Effects of Donor Pre-Treatment with Dopamine on Survival After Heart Transplantation: A Cohort Study of Heart Transplant Recipients Nested in a Randomized Controlled Multicentre Trial
J Am Coll Cardiol 2010;56:1768-1777
Treatment of brain-dead donors with dopamine of 4 μg/kg/min will not harm cardiac allografts but appears to improve the clinical course of the heart allograft recipient.

Canadian Cardiovascular Society Focused Position Statement Update on Assessment of the Cardiac Patient for Fitness to Drive: Fitness following Left Ventricular Assist Device Implantation
Can J Cardio 2012;28:137-140
Patients with a continuous flow, NYHA class HB, LVAD that are stable 2 mo post LVAD implantation qualify for private driving only and are disqualified from commercial driving.
**Myocardial Disease**

**Definition of Cardiomyopathy**
- intrinsic or primary myocardial disease not secondary to congenital, hypertensive, coronary, valvular, or pericardial disease
- functional classification: dilated, hypertrophic, or restrictive
- LV dysfunction 2º to MI often termed “ischemic cardiomyopathy”, is not a true cardiomyopathy (i.e. primary myocardial disorder) since the primary pathology is obstructive CAD

<table>

---

**Myocarditis**

**Definition**
- inflammatory process involving the myocardium ranging from acute to chronic; an important cause of dilated cardiomyopathy

**Etiology**
- idiopathic
- infectious
  - viral: *S. aureus, C. perfringens, C. diphtheriae, Mycoplasma, Rickettsia*
  - bacterial: *S. aureus, C. perfringens, C. diphtheriae, Mycoplasma, Rickettsia*
  - fungi
  - spirochetal (*Lyme disease – Borrelia burgdorferi*)
  - Chagas disease (*Trypanosoma cruzi*)
- toxic: catecholamines, chemotheraphy, cocaine
- hypersensitivity/eosinophilic: drugs (antibiotics, diuretics, lithium, clozapine), insect/snake bites
- systemic diseases: collagen vascular diseases (SLE, rheumatoid arthritis, others), sarcoidosis, autoimmune
- other: giant cell myocarditis, acute rheumatic fever

**Signs and Symptoms**
- constitutional symptoms
- acute CHF - dyspnea, tachycardia, elevated JVP
- chest pain – due to pericarditis or cardiac ischemia
- arrhythmias
- systemic or pulmonary emboli
- pre-syncope/syncope/sudden death

**Investigations**
- ECG: non-specific ST-T changes ± conduction defects
- blood work
  - increased CK, troponin, LDH, and AST with acute myocardial necrosis ± increased WBC, ESR, ANA, rheumatoid factor, complement levels
  - blood culture, viral titres and cold agglutinins for Mycoplasma
- CXR: enlarged cardiac silhouette
- echo: dilated, hypokinetic chambers, segmental wall motion abnormalities
- cardiovascular magnetic resonance: functional and morphological abnormalities as well as tissue pathology (gadolinium enhancement)
- myocardial biopsy

**Management**
- supportive care
- restrict physical activity
- treat CHF
- treat arrhythmias
- anticoagulation
- treat underlying cause if possible
Prognosis
• often unrecognized, and may be self-limited
• myocarditis treatment trial showed 5yr mortality between 25-50%
• giant cell myocarditis, although rare can present with fulminant CHF and be rapidly fatal, with 5yr mortality >80%
• sudden death in young adults
• may progress to dilated cardiomyopathy

Dilated Cardiomyopathy

Definition
• unexplained dilation and impaired systolic function of one or both ventricles

Etiology
• idiopathic (presumed viral or idiopathic) ~50% of DCM
• alcohol
• familial/genetic
• uncontrolled tachycardia (e.g. persistent rapid AFib)
• collagen vascular disease: SLE, polyarteritis nodosa, dermatomyositis, progressive systemic sclerosis
• infectious: viral (coxsackie B, HIV), Chagas disease, Lyme disease, Rickettsial diseases, acute rheumatic fever, toxoplasmosis
• neuromuscular disease: Duchenne muscular dystrophy, myotonic dystrophy, Friedreich's ataxia
• metabolic: uremia, nutritional deficiency (thiamine, selenium, carnitine)
• endocrine: hyper/hypothyroidism, DM, pheochromocytoma
• peripartum
• toxic: cocaine, heroin, organic solvents
• drugs: chemotherapies (doxorubicin, cyclophosphamide), anti-retrovirals, chloroquine, clozapine, TCA
• radiation

Signs and Symptoms
• may present as
  • CHF
  • systemic or pulmonary emboli
  • arrhythmias
  • sudden death (major cause of mortality due to fatal arrhythmia)

Investigations
• blood work: CBC, electrolytes, Cr, bicarbonate, BNP, CK, troponin, LFTs, TSH, TIBC
• ECG: variable ST-T wave abnormalities, poor R wave progression, conduction defects (e.g. BBB), arrhythmias (non-sustained VT)
• CXR: global cardiomegaly (globular heart), signs of CHF, pleural effusion
• echocardiography: chamber enlargement, global hypokinesis, depressed LVEF, MR and TR, mural thrombi
• endomyocardial biopsy: not routine, used to rule out a treatable cause
• coronary angiography: in selected patients to exclude ischemic heart disease

Management
• treat underlying disease: e.g. abstinence from alcohol
• treat CHF: see Heart Failure, C36
• thromboembolism prophylaxis: anticoagulation with warfarin
• indicated for: AFib, history of thromboembolism or documented thrombus
• treat symptomatic or serious arrhythmias
• immunize against influenza and S. pneumoniae
• consider surgical options (e.g. LVAD, transplant, volume reduction surgery) in appropriate candidates with severe, drug refractory disease
• consider ICD among patients with a LVEF <30%

Prognosis
• depends on etiology
• better with reversible underlying cause, worst with infiltrative diseases, HIV, drug-induced
• cause of death usually CHF (due to pump failure) or sudden death 2° to ventricular arrhythmias
• systemic emboli are significant source of morbidity
• 20% mortality in 1st yr, 10% per year after
Hypertrophic Cardiomyopathy

Definition
- Defined as unexplained ventricular hypertrophy
- Various patterns of HCM are classified, but most causes involve pattern of septal hypertrophy

Etiology and Pathophysiology
- Histopathologic features include myocyte disarray, myocyte hypertrophy, and interstitial fibrosis
- Cause is felt to be a genetic defect involving one of the cardiac sarcomeric proteins (>400 mutations associated with autosomal dominant inheritance, incomplete penetrance)
- Prevalence of 1/500-1/1,000 in general population
- Generally presents in early adulthood

Hemodynamic Classification
- Hypertrophic obstructive cardiomyopathy (HOCM): dynamic LV outflow tract (LVOT) obstruction, either at rest or with provocation, defined as LVOT gradient of at least 30 mmHg
  - Dynamic i.e. obstruction (and the murmur) is reduced with maneuvers that increase preload, and augmented with maneuvers that reduce preload
- Non-obstructive HCM: no LVOT obstruction
- Many patients have diastolic dysfunction (impaired ventricular filling secondary to LV hypertrophy which decreases compliance)

Signs and Symptoms
- Clinical manifestations: asymptomatic (common, therefore screening is important), SOB on exertion, angina, presyncope/syncope (due to LV outflow obstruction or arrhythmia), CHF, arrhythmias, SCD
- Pulses: rapid upstroke, "spike and dome" pattern in carotid pulse (in HCM with outflow tract obstruction)
- Precordial palpation: PMI localized, sustained, double impulse, ‘triple ripple’ (triple apical impulse in HOCM), LV lift
- Precordial auscultation: normal or paradoxically split S2, S4, harsh systolic diamond-shaped murmur at LLSB or apex, enhanced by squat to standing or Valsalva (murmur secondary to LVOT obstruction as compared to AS); often with pansystolic murmur due to mitral regurgitation

Investigations
- ECG/Holter monitor: LVH, high voltages across precordium, prominent Q waves (lead I, aVL, V5, V6), tall R wave in V1, P wave abnormalities
- Transthoracic echocardiography and echo-Doppler study: asymmetric septal hypertrophy (less commonly apical), systolic anterior motion (SAM) of mitral valve and MR; LVOT gradient can be estimated by Doppler measurement
- Genetic studies (± magnetic resonance imaging) can be helpful when echocardiography is inconclusive for diagnosis
- Cardiac catheterization (only when patient being considered for invasive therapy)

Management
- Avoid factors which increase obstruction (e.g. volume depletion)
  - Avoidance of all competitive sports
- Treatment of obstructive HCM
  - Medical agents: β-blockers, disopyramide, verapamil (started only in monitored setting), phenylephrine (in setting of cardiogenic shock)
  - Avoid nitrates, diuretics, and ACEI as they increase LVOT gradient and worsen symptoms
- Patients with obstructive HCM and drug-refractory symptoms
  - Surgical myectomy
  - Alcohol septal ablation - percutaneous Intervention that ablates the hypertrophic septum with 100% ethanol via the septal artery
  - Dual chamber pacing (rarely done)
- Treatment of patients at high risk of sudden death: ICD
- First-degree relatives (children, siblings, parents) of patients with HCM should be screened (physical, ECG, 2D echo) every 12-18 mo during during adolescence, then serially every 5 yr during adulthood
Prognosis
• potential complications: AFib, VT, CHF, sudden cardiac death (1% risk/yr; most common cause of SCD in young athletes)
  ▪ major risk factors for sudden death (consider ICD placement)
  ▪ history of survived cardiac arrest/sustained VT
  ▪ family history of multiple premature sudden deaths
  ▪ other factors associated with increased risk of sudden cardiac death
    • syncope (presumed to be arrhythmic in origin)
    • non-sustained VT on ambulatory monitoring
    • marked ventricular hypertrophy (maximum wall thickness ≥30 mm)
    • abnormal BP in response to exercise (in patients <40 yr old with HCM)

Restrictive Cardiomyopathy

Definition
• impaired ventricular filling with preserved systolic function in a non-dilated, non-hypertrophied ventricle secondary to factors that decrease myocardial compliance (fibrosis and/or infiltration)

Etiology
• infiltrative: amyloidosis, sarcoidosis
• non-infiltrative: scleroderma, idiopathic myocardial fibrosis
• storage diseases: hemochromatosis, Fabry’s disease, Gaucher’s disease, glycogen storage diseases
• endomyocardial
  ▪ endomyocardial fibrosis, Loeffer’s endocarditis, or eosinophilic endomyocardial disease
  ▪ radiation heart disease
  ▪ carcinoid syndrome (may have associated tricuspid valve or pulmonary valve dysfunction)

Clinical Manifestations
• CHF (usually with preserved LV systolic function), arrhythmias
• elevated JVP with prominent x and y descents, Kussmaul’s sign
• S3, S4, MR, TR
• thromboembolic events

Investigations
• ECG: low voltage, non-specific, diffuse ST-T wave changes ± non-ischemic Q waves
• CXR: mild cardiac enlargement
• Echo: LAE, RAE; specific Doppler findings with no significant respiratory variation
• cardiac catheterization: increased end-diastolic ventricular pressures
• endomyocardial biopsy: to determine etiology (especially for infiltrative RCM)

Management
• exclude constrictive pericarditis
• treat underlying disease: control HR, anticoagulate if AFib
• supportive care and treatment for CHF, arrhythmias
• heart transplant: might be considered for CHF refractory to medical therapy

Prognosis
• depends on etiology

Key Investigations
• Echo: may show respiratory variation in blood flow in CP
• CT: may show very thickened pericardium and calcification in CP
• MRI: best modality to directly visualize pericardium and myocardium

RCM vs. Constrictive Pericarditis (CP)
Present similarly but CP is treatable with surgery
Valvular Heart Disease

- see Guidelines on the Management of Valvular Heart Disease. JACC Jun 10;63(22):2438-88 for details

Infective Endocarditis

- see Infectious Diseases, ID16
- American Heart Association (AHA) 2007 guidelines recommend IE prophylaxis
  - only for patients with
    - prosthetic valve material
    - past history of IE
    - certain types of congenital heart disease
    - cardiac transplant recipients who develop valvulopathy
  - only for the following procedures
    - dental
    - respiratory tract
    - procedures on infected skin/skin structures/MSK structures
    - not GI/GU procedures specifically

Rheumatic Fever

- see Pediatrics, P59

Prognosis

- acute complications: myocarditis (DCM/CHF), conduction abnormalities (sinus tachycardia, AFib), valvulitis (acute MR), acute pericarditis (not constrictive pericarditis)
- chronic complications: rheumatic valvular heart disease – fibrous thickening, adhesion, calcification of valve leaflets resulting in stenosis/regurgitation, increased risk of IE ± thromboembolism
- onset of symptoms usually after 10-20 yr latency from acute carditis of rheumatic fever
- mitral valve most commonly affected

Valve Repair and Valve Replacement

- indication for valve repair or replacement depends on the severity of the pathology; typically recommended when medical management has failed to adequately improve the symptoms or reduce the risk of morbidity and mortality
- pathologies that may require surgical intervention include congenital defects, infections, rheumatic heart disease, as well as a variety of valve diseases associated with aging
- valve repair: balloon valvuloplasty, surgical valvuloplasty (commissurotomy, annuloplasty), chordae tendineae shortening, tissue patch
- valve replacement: typically for aortic or mitral valves only; repair is favored in younger individuals; percutaneous techniques being established

Choice of Valve Prosthesis

Mitrval Valve Repair vs. Replacement for Severe Ischemic Mitral Regurgitation

NEJM 2014;370:23-32

Purpose: Ischemic mitral regurgitation is associated with significant mortality risk. The purpose of this study was to compare the effectiveness and safety of repairing versus replacing the mitral valve in patients with severe chronic ischemic mitral regurgitation.

Study Design: RCT with 251 patients with severe ischemic mitral regurgitation were randomly assigned to mitral valve repair or chordal-sparing replacement. The primary endpoint was the left ventricular end-systolic volume index (LVESVI) at 12 mo.

Results: There were no significant between-group differences in LVESVI, in the rate of major adverse cardiac or cerebrovascular events, in functional status, or in quality of life at 12 mo. The rate of moderate or severe mitral regurgitation recurrence at 12 mo was significantly higher in the repair group than in the replacement group (32.6% vs. 2.3%, respectively).

Conclusions: No significant difference in left ventricular reverse modeling or survival at 12 mo between patients who underwent mitral valve repair or replacement. Replacement provided more durable correction of mitral regurgitation, but there were no significant differences in clinical outcomes.

**Summary of Valvular Disease**

### Aortic Stenosis (AS)
- **Etiology:** Congenital (bicuspid, unicuspid valve), calcification (wear and tear), rheumatic disease
- **Definition:** Normal aortic valve area = 3.4 cm²
  - Mild AS: 1.5 to 3 cm²
  - Moderate AS: 1.0 to 1.5 cm²
  - Severe AS: < 1.0 cm²
- **Pathophysiology:** Outflow obstruction → increased EDP → concentric LVH → LV failure → CHF, subendocardial ischemia
- **Symptoms:** Exertional angina, syncope, dyspnea, PND, orthopnea, peripheral edema
- **Physical Exam:** Narrow pulse pressure, brachial-radial delay, pulsus parvus et tardus, sustained PMI
  - Echocardiography: decreased aortic valve area, pressure gradient, LVH, reduced LV function
- **Investigations:**
  - Electrocardiogram (ECG): LVH and strain, LBBB, LAE, AFib
  - Chest X-ray (CXR): LAE, CHF, aortic valve calcification
  - Echocardiogram (Echo): reduced valve area, pressure gradient, LVH, reduced LV function
- **Treatment:**
  - Asymptomatic: serial echos, avoid exertion
  - Symptomatic: avoid nitrates/arterial dilators and ACEI in severe AS
- **Interventional Options:**
  - Percutaneous balloon valvuloplasty (in very young)
  - Valve replacement
  - Valve repair
- **Surgical Options:**
  - Aortic root replacement (Bentall procedure): when ascending aortic aneurysm present, valve conduit used

### Mitral Stenosis (MS)
- **Etiology:** Rheumatic disease most common cause, congenital (rare)
- **Definition:** Severe MS is mitral valve area (MVA) < 1.2 cm²
- **Pathophysiology:**
  - MS → fixed CO and LAE → increased LA pressure → pulmonary vascular resistance and CHF; worse with AFib (no atrial kick), tachycardia (decreased atrial emptying time) and pregnancy (increased preload)
- **Symptoms:**
  - DSB on exertion, orthopnea, fatigue, palpitations, peripheral edema, malar flush, pinched and blue facies (severe MS)
  - Physical Exam: AFib, no “a” wave on JVP, left parasternal lift, palpable diastolic thrill at apex
  - Auscultation: mid-diastolic rumble at apex, best heard with bell in left lateral decubitus position following exertion, loud S1, OS following loud P2 (heard best during expiration), long diastolic murmur and short A2-OS interval correlate with worse MS
- **Investigations:**
  - ECG: NSR, AFib, LVEF (P mitral), RVH, RAD
  - CXR: LAE, CHF, mitral valve calcification
  - Echo/TTE: shows restricted opening of mitral valve
  - Cath: indicated in concurrent CAD if > 40 yr (male) or > 50 yr (female)
- **Treatment:**
  - Avoid exertion, fever (increased LA pressure), treat AFib and CHF, increase diastolic filling time (I-blockers, digitalis)
  - Surgery if: NYHA class III-IV CHF, LV dilatation/aneurysm (CHF, DCM, myocardin), IE abscess, Marfan’s syndrome, HOCM, acute MI, myxoma, mitral valve annulus calcification, chordae/papillary muscle trauma/ischemia/rupture (acute), rheumatic disease
- **Interventional Options:**
  - Percutaneous balloon valvuloplasty: young rheumatic pts and good leaflet morphology (can be determined by echo), asymptomatic pts with moderate-severe MS, pulmonary HTN
  - Contraindication: left atrial thrombus, moderate MR
- **Surgical Options:**
  - Open Mitral Commissurotomy: if mild calcification + leaflet/chordal thickening
  - Valve replacement: failure of repair, heavily calcified annulus
  - Advantage of repair: low rate of endocarditis, no anticoagulation, less chance of re-operation
Table 16. Valvular Heart Disease (continued)

**Tricuspid Stenosis (TS)**

**Etiology**
Rheumatic disease, congenital, carcinoid syndrome, fibroelastosis; usually accompanied by MS

**Pathophysiology**
Increased RA pressure → right heart failure → decreased CO and fixed on exertion

**Symptoms**
Peripheral edema, fatigue, palpitations

**Physical Exam**
Prominent "a" waves in JVP; +ve abdominojugular reflex, Kussmaul’s sign, diastolic rumble 4th left intercostal space

**Investigations**
ECG: RAE
CXR: dilatation of RA without pulmonary artery enlargement
Echo: diagnostic

**Treatment**
Preload reduction (diuretics), slow HR, surgery if: only if other surgery required (e.g. mitral valve replacement)

**Surgical Options**
Valve Replacement:
- Only if severely diseased valve
- Bioprosthesis preferred

**Tricuspid Regurgitation (TR)**

**Etiology**
RV dilation, IE (particularly due to IV drug use), rheumatic disease, congenital (Ebstein anomaly), carcinoid

**Pathophysiology**
RV dilatation → TR → further RV dilatation → right heart failure

**Symptoms**
Peripheral edema, fatigue, palpitations

**Physical Exam**
"cv" waves in JVP; +ve abdominojugular reflex, Kussmaul’s sign, holosystolic murmur at LLSB accentuated by inspiration, left parasternal lift

**Investigations**
ECG: RAE, RV, AFib
CXR: RAE, RV enlargement
Echo: diagnostic

**Treatment**
Preload reduction (diuretics)
Surgery if: only if other surgery required (e.g. mitral valve replacement)

**Surgical Options**
Annuloplasty (i.e. repair, rarely replacement)

**Pulmonary Stenosis (PS)**

**Etiology**
Usually congenital, rheumatic disease (rare), carcinoid syndrome

**Pathophysiology**
Increased RV pressure → RV hypertrophy → right heart failure

**Symptoms**
Chest pain, syncope, fatigue, peripheral edema

**Physical Exam**
Systolic murmur at 2nd left intercostal space accentuated by inspiration, pulmonary ejection click, right-sided S4

**Investigations**
ECG: RVH
CXR: prominent pulmonary arteries enlarged RV
Echo: diagnostically

**Treatment**
Balloon valvuloplasty if severe symptoms

**Surgical Options**
Percutaneous or open balloon valvuloplasty

**Pulmonary Regurgitation (PR)**

**Etiology**
Pulmonary HTN, IE, rheumatic disease, tetralogy of Fallot (post-repair)

**Pathophysiology**
Increased RV volume → increased wall tension → RV hypertrophy → right heart failure

**Symptoms**
Chest pain, syncope, fatigue, peripheral edema

**Physical Exam**
Early diastolic murmur at LLSB, Graham Steell (diastolic) murmur 2nd and 3rd left interspace increasing with inspiration

**Investigations**
ECG: RVH
CXR: prominent pulmonary arteries if pulmonary HTN; enlarged RV
Echo: diagnostic

**Treatment**
Rarely requires treatment; valve replacement (rarely done)

**Surgical Options**
Pulmonary valve replacement

**Mitral Valve Prolapse (MVP)**

**Etiology**
Myxomatous degeneration of chordae, thick, bulky leaflets that crowd orifice, associated with Marfan’s syndrome, pectus excavatum, straight back syndrome, other MSK abnormalities; <3% of population

**Pathophysiology**
Mitral valve displaced into LA during systole; no causal mechanisms found for symptoms

**Symptoms**
Prolonged, stabbing chest pain, dyspnea, anxiety/panic, palpitations, fatigue, presyncope

**Physical Exam**
Auscultation: mid-systolic click (due to billowing of mitral leaflet into LA; tensing of redundant valve tissue); mid to late systolic murmur at apex, accentuated by Valsalva or squat-to-stand maneuvers

**Investigations**
ECG: non-specific ST-T wave changes, paroxysmal SVT, ventricular ectopy
Echo: systolic displacement of thickened mitral valve leaflets into LA

**Treatment**
Asymptomatic: no treatment; reassurance
Symptomatic: ß-blockers and avoidance of stimulants (caffeine) for significant palpitations, anticoagulation if AFib

**Surgical Options**
Mitral valve surgery (repair favoured over replacement) if symptomatic and significant MR
Figure 41. Hemodynamics of aortic stenosis
Stenosis across the aortic valve results in the generation of a significant pressure gradient between the left ventricle and the aorta and a crescendo-decrescendo murmur during systolic contraction. The stenosis decreases the intensity of aortic valve closure hence diminishing S2.

Figure 42. Hemodynamics of aortic regurgitation
Regurgitation across the aortic valve during diastole causes the aortic pressure to rapidly decrease and a decrescendo murmur can be heard at the onset of diastole (after S2 is audible). The presence of regurgitant blood from the aorta increases left-ventricular end-diastolic volume.

Figure 43. Hemodynamics of acute mitral regurgitation
During systolic contraction, blood regurgitates from the left ventricle into the left atrium across the incompetent mitral valve resulting in an audible holosystolic murmur between S1 and S2. The portion of left ventricular end-diastolic volume that regurgitates into the left atrial myocardium increases left atrial pressures resulting in a tall V-wave (in the JVP).

Figure 44. Hemodynamics of mitral stenosis
First note that the left atrial pressure exceeds the left ventricular pressure during diastole due to mitral stenosis and the consequent generation of a pressure gradient across the left atrium and left ventricle. In diastole the stenotic mitral valve opens which corresponds to the opening snap (OS) and the passage of blood across the mitral stenosis results in an audible decrescendo murmur. Left atrial contraction prior to S1 increases the pressure gradient resulting in accentuation of the murmur before S1 is audible.
Pericardial Disease

Acute Pericarditis

Etiology of Pericarditis/Pericardial Effusion
- idiopathic is most common: presumed to be viral
- infectious
  - viral: Coxsackie virus A, B (most common), echovirus
  - bacterial: *S. pneumoniae, S. aureus*
- TB
- fungal: histoplasmosis, blastomycosis
- post-MI: acute (direct extension of myocardial inflammation, 1-7 d post-MI), Dressler’s syndrome (autoimmune reaction, 2-8 wk post-MI)
- post-cardiac surgery (e.g. CABG), other trauma
- metabolic: uremia (common), hypothyroidism
- neoplasm: Hodgkin’s, breast, lung, renal cell carcinoma, melanoma
- collagen vascular disease: SLE, polyarteritis, rheumatoid arthritis, scleroderma
- vascular: dissecting aneurysm
- other: drugs (e.g. hydralazine), radiation, infiltrative disease (sarcoid)

Signs and Symptoms
- diagnostic triad: chest pain, friction rub and ECG changes (diffuse ST elevation and PR depression with reciprocal changes in aVR)
- pleuritic chest pain: alleviated by sitting up and leaning forward
- pericardial friction rub: may be uni-, bi-, or triphasic; evanescent and rare
- ± fever, malaise

Investigations
- ECG: initially diffuse elevated ST segments ± depressed PR segment, the elevation in the ST segment is concave upwards → 2-5 d later ST isoelectric with T wave flattening and inversion
- CXR: normal heart size, pulmonary infiltrates
- Echo: performed to assess for pericardial effusion

Treatment
- treat the underlying disease
- anti-inflammatory agents (high dose NSAIDs/ASA, steroids use controversial), analgesics

Complications
- recurrent episodes of pericarditis, atrial arrhythmia, pericardial effusion, tamponade, constrictive pericarditis

Pericardial Effusion

Etiology
- transudative (serous)
- CHF, hypoalbuminemia/hypoproteinemia, hypothyroidism
- exudative (serosanguinous or bloody)
  - causes similar to the causes of acute pericarditis
  - may develop acute effusion secondary to hemopericardium (trauma, post-MI myocardial rupture, aortic dissection)
- physiologic consequences depend on type and volume of effusion, rate of effusion development, and underlying cardiac disease

Signs and Symptoms
- may be asymptomatic or similar to acute pericarditis
- dyspnea, cough
- extra-cardiac (esophageal/recurrent laryngeal nerve/tracheo-bronchial/phrenic nerve irritation)
- JVP increased with dominant “x” descent
- arterial pulse normal to decreased volume, decreased pulse pressure
- auscultation: distant heart sounds ± rub
- Ewart’s sign

Ewart’s Sign
Bronchial breathing and dullness to percussion at the lower angle of the left scapula in pericardial effusion due to effusion compressing left lower lobe of lung
Investigations
- ECG: low voltage (sum of QRS in I + II + III < 155 or V1 + V2 + V3 < 3010 MM), flat T waves, electrical alternans (classic, but not sensitive to exclude effusion)
- be cautious in diagnosing STEMI in a patient with pericarditis and an effusion - antiplatelets may precipitate hemorrhagic effusion
- CXR: cardiomegaly, rounded cardiac contour
- ER: bedside ultrasound with subxiphoid view showing fluid in pericardial sac
- Echo (procedure of choice): fluid in pericardial sac
- pericardiocentesis: definitive method of determining transudate vs. exudate, identify infectious agents, neoplastic involvement

Treatment
- mild: frequent observation with serial echos, treat underlying cause, anti-inflammatory agents
- severe: treat as in tamponade (see Cardiac Tamponade)

Cardiac Tamponade

Etiology
- major complication of rapidly accumulating pericardial effusion
- cardiac tamponade is a clinical diagnosis
- any cause of pericarditis but especially trauma, malignancy, uremia, proximal aortic dissection with rupture

Pathophysiology
- high intra-pericardial pressure → decreased venous return → decreased diastolic ventricular filling → decreased CO → hypotension and venous congestion

Signs and Symptoms
- tachypnea, dyspnea, shock, muffled heart sounds
- pulsus paradoxus (inspiratory fall in systolic BP > 10 mmHg during quiet breathing)
- JVP “x” descent only, blunted “y” descent
- hepatic congestion/peripheral edema

Investigations
- ECG: electrical alternans (pathognomonic variation in R wave amplitude), low voltage
- echo: pericardial effusion, compression of cardiac chambers (RA and RV) in diastole
- cardiac catheterization

Treatment
- pericardiocentesis: Echo-guided
- pericardiotomy
- avoid diuretics and vasodilators (these decrease venous return to already under-filled RV → decrease LV preload → decrease CO)
- IV fluid may increase CO
- treat underlying cause

Constrictive Pericarditis

Etiology
- chronic pericarditis resulting in fibrosed, thickened, adherent, and/or calcified pericardium
- any cause of acute pericarditis may result in chronic pericarditis
- major causes are idiopathic, post-infectious (viral, TB), radiation, post-cardiac surgery, uremia, MI, collagen vascular disease

Signs and Symptoms
- dyspnea, fatigue, palpitations
- abdominal pain
- may mimic CHF (especially right-sided HF)
  - ascites, hepatosplenomegaly, edema
  - increased JVP, Kussmaul's sign (paradoxical increase in JVP with inspiration), Friedreich's sign (prominent “y” descent)
  - BP usually normal (and usually no pulsus paradoxus)
  - precordial examination: ± pericardial knock (early diastolic sound)
- see Table 17 for differentiation from cardiac tamponade

Investigations
- ECG: non-specific – low voltage, flat T wave, ± AFib
- CXR: pericardial calcification, effusions
- echo/CT/MRI: pericardial thickening
- cardiac catheterization: equalization of end-diastolic chamber pressures (diagnostic)

Treatment
- medical: diuretics, salt restriction
- surgical: pericardiectomy (only if refractory to medical therapy)
- prognosis best with idiopathic or infectious cause and worst in post-radiation; death may result from heart failure

### Common Medications

#### ANGIOTENSIN CONVERTING ENZYME INHIBITORS (ACEI)
- **Examples**
  - enalapril (Vasotec®)
  - perindopril (Coversyl®)
  - ramipril (Altace®)
  - lisinopril (Zestril®)
- **Mechanism of Action**
  Inhibit ACE-mediated conversion of angiotensin I to angiotensin II (AT II), causing peripheral vasodilation and decreased aldosterone synthesis
- **Indications**
  - HTN, CAD, CHF, post-MI, DM
- **Side Effects**
  - Dry cough, 10% hypotension, fatigue, hyperkalemia, renal insufficiency, angioedema
- **Contraindications**
  - Bilateral renal artery stenosis, pregnancy, caution in decreased GFR

#### ANGIOTENSIN II RECEPTOR BLOCKERS (ARBs)
- **Examples**
  - candesartan
  - irebesartan
  - valsartan
- **Mechanism of Action**
  Block AT II receptors, causing similar effects to ACEI
- **Indications**
  - Same as ACEI, although evidence is generally less for ARBs; often used when ACEI are not tolerated
- **Side Effects**
  - Similar to ACEI, but do not cause dry cough
- **Contraindications**
  - Same as ACEI

#### DIRECT RENIN INHIBITORS (DRIs)
- **Examples**
  - aliskiren
- **Mechanism of Action**
  Directly blocks renin thus inhibiting the conversion of angiotensinogen to angiotensin I; this also causes a decrease in AT II
- **Indications**
  - HTN (exact role of this drug remains unclear)
- **Side Effects**
  - Diarrhea, hyperkalemia (higher risk if used with an ACEI), rash, cough, angioedema, reflux, hypotension, rhabdomyolysis, seizure
- **Contraindications**
  - Pregnancy, severe renal impairment

#### &-BLOCKERS
- **Examples**
  - &1 antagonists
    - atenolol, metoprolol, bisoprolol
  - &1/2 antagonists
    - propranolol
  - &1 antagonists with intrinsic sympathomimetic activity
    - acebutalol
- **Mechanism of Action**
  Block &-adrenergic receptors, decreasing HR, BP, contractility, and myocardial oxygen demand, slow conduction through the AV node
- **Indications**
  - HTN, CAD, acute MI, post-MI, CHF (start low and go slow), AFib, SVT
- **Side Effects**
  - Hypotension, fatigue, light-headedness, depression, bradycardia, hyperkalemia, bronchospasm, Raynaud’s phenomenon, claudication
- **Contraindications**
  - Sinus bradycardia, 2nd or 3rd degree heart block, hypotension, WPW

#### CALCIUM CHANNEL BLOCKERS (CCBs)
- **Examples**
  - Benzothiazepines
    - diltiazem
  - Phenylalkylamines (non-dihydropyridines)
    - verapamil
  - Dihydropyridines
    - amlodipine
    - nifedipine (Adalat®)
    - felodipine (Plendil®)
- **Mechanism of Action**
  Block smooth muscle and myocardial calcium channels causing effects similar to &-blockers
- **Indications**
  - HTN, CAD, SVT, diastolic dysfunction
- **Side Effects**
  - Hypotension, edema, flushing, headache, light-headedness
- **Contraindications**
  - Sinus bradycardia, 2nd or 3rd degree heart block, hypotension, WPW

#### DIURETICS
- **Examples**
  - Thiazides
    - hydrochlorothiazide, chlorothalidone, metolazone
  - Loop diuretics
    - furosemide (Lasix®)
  - Aldosterone receptor antagonists
    - spironolactone
    - eplerenone
- **Mechanism of Action**
  Reduce Na+ reabsorption in the distal convoluted tubule (DCT)
  Blocks Na+ /K+ -ATPase in the loop of Henle
  Antagonize aldosterone receptors
- **Indications**
  - HTN, CHF, hypokalemia
  - Edema, hyperkalemia, gynecomastia
- **Side Effects**
  - Hypotension, polyuria
  - Hypovolemia, hypokalemic metabolic alkalosis
  - Edema, hyperkalemia, anorexia, N/V
- **Contraindications**
  - Sufa allergy, pregnancy
  - Hypovolemia, hypokalemia
  - Renal insufficiency, hyperkalemia, pregnancy

#### INOTROPES
- **Examples**
  - digoxin (Lanoxin®)
- **Mechanism of Action**
  Inhibit Na+ /K+ -ATPase, leading to increased intracellular Na+ and Ca2+ concentration and increased myocardial contractility
  Also slows conduction through the AV node
- **Indications**
  - CHF, AFib
  - AV block, tachyarrhythmias, bradyarrhythmias, blurred or yellow vision (van Gogh syndrome), anorexia, N/V
- **Contraindications**
  - 2nd or 3rd degree AV block, hypokalemia, WPW

Arrhythmias

Percutaneous Angiography/PCI

Cardiovascular Surgery
General Principles

Drug Nomenclature

- **chemical name**: describes chemical structure; consistent in all countries (e.g. \(N\)-(4-hydroxyphenyl)acetamide is acetaminophen)
- **DIN** or **NDC**: DIN assigned by Health Canada; NDC assigned by FDA (US)
- **non-proprietary name**: approved name (post-phase III trial), official name (listed in pharmacopoeia), or generic name (off-patent) (e.g. acetaminophen)
- **proprietary (trade) name**: the brand name or registered trademark (e.g. Tylenol®)

**Phases of Clinical Drug Testing**

- **phase I**: first administration to healthy human volunteers, following animal studies; to determine PK and PD
- **phase II**: first administration to patients, small sample sizes; to determine initial safety and efficacy, dose range, PK, and PD
- **phase III**: large sample sizes, often double-blinded RCT; comparative (new drug vs. placebo or standard of care) to establish safety and efficacy
- **phase IV**: post-marketing surveillance, wide distribution; to determine effects of long-term use, rare ADRs, ideal dosing, and effects in real-world practice

**Drug Administration**

- choice of route of administration depends on: drug properties, local and systemic effects, desired onset and/or duration of action, and patient characteristics

**Table 1. Routes of Drug Administration**

<table>
<thead>
<tr>
<th>Route</th>

**Common Latin Abbreviations**

- q each, every
- OD/bid/tid/qid once/twice/three/four times a day
- hs at bedtime
- ac/po/cc before/after/with meals
- prn as necessary
- gtt drops
- ung ointment
- ud as directed
- od/os/ou right/left/each eye
- ad/as/ae right/left/each ear

At the time of drug launch, only data from phases I-III are available; thus, effectiveness and safety may be unknown because real-world patients and usage patterns often differ from those in premarket phases.
Pharmacokinetics

- study of “what the body does to a drug”
- definition: relationship between drug administration, time-course/rate of absorption and distribution, concentration changes in the body compartments, and the drug’s removal from the body

Absorption

- definition: movement of the drug from the site of administration into plasma

Mechanisms of Drug Absorption

- most drugs are absorbed into the systemic circulation via passive diffusion
- other mechanisms: active transport, facilitated diffusion, and pinocytosis/phagocytosis

Factors Affecting the Rate and Extent of Drug Absorption

- \( P_{o/w} \) (i.e. its relative solubility in oil (lipid) vs. water)
- local blood flow at the site of administration (e.g. sublingual vessels facilitate rapid absorption of SL medications)
- molecular size (e.g. small molecular weight drugs absorb faster)
- \( \text{pH and drug ionization} \)
  - drugs are usually weak acids (e.g. ASA) or weak bases (e.g. ketoconazole) and thus exist in ionized and non-ionized forms
  - body compartment \( \text{pH} \) and drug \( \text{pK}_a \) determine the ratio of ionized to non-ionized drug molecules (using the Henderson-Hasselbach equation)
  - non-ionized forms cross cell membranes much faster than ionized (charged) forms
- total surface area for absorption
  - small intestinal villi are the primary site of absorption for most oral drugs

Bioavailability (F)

- definition: proportion of dose that reaches systemic circulation in an unchanged state
- decreased by: limited drug absorption or gut metabolism and hepatic first-pass effect
- IV dose has 100% bioavailability (\( F = 1 \))

First-Pass Effect

- definition: drug metabolism by the liver and sometimes the gut before it reaches systemic circulation, resulting in reduced F
- occurs with PO administration of a drug: GI tract (absorption) → portal vein to liver (first-pass metabolism) → systemic circulation
- occurs to a much lesser extent with PR administration because drug absorbed in colon bypasses the portal system: colon (absorption) → internal pudendal veins → IVC → systemic circulation

Efflux Pump

- Pgp is a protein in the GI tract, renal epithelium, and elsewhere that acts as a multidrug efflux pump involved in the transport of drugs out of cells
- opposes intestinal absorption and enhances renal elimination of certain drugs (e.g. digoxin, dabigatran, etoposide, paclitaxel, tacrolimus, cyclosporine)
- some drugs (e.g. macrolide antibiotics) inhibit Pgp function, leading to increased levels of Pgp substrates; Pgp inducers (e.g. St. John’s wort) do the opposite
- some tumours overexpress Pgp leading to multidrug resistance to chemotherapy agents

Distribution

- definition: movement of drugs between different body compartments and to the site of action
- major body fluid compartments: plasma, interstitial fluid, intracellular fluid, transcellular fluid (e.g. CSF, peritoneal, pleural)
- tissue compartments: fat, brain

Factors Affecting the Rate and Extent of Drug Distribution

- physiochemical properties of the drug (e.g. \( P_{o/w} \) and \( \text{pK}_a \))
- \( \text{pH} \) of fluid
- plasma protein binding
- binding within compartments (i.e. depots)
- regional blood flow

**Figure 1. Distribution of total body water (TBW)**
Volume of Distribution
- maximum actual V_d (anatomic fluid volume accessible to drug) = TBW (TBW~40 L for average adult)
- V_d: the apparent volume of fluid into which a drug distributes
  - a calculated value = amount of drug in body ÷ plasma drug concentration
  - a theoretical value that does not correspond to an anatomical space (i.e. can exceed TBW)
  - a calculated V_d of a drug that concentrates in plasma and/or binds plasma proteins to a high degree
  - large V_d corresponds to a drug that distributes into tissues (fat, muscle, etc.); most is not in blood (measured) space, and it therefore appears to distribute in a large volume
  - V_d of plasma-protein bound drugs can be altered by liver and kidney disease
- example: amiodarone distributes into TBW (actual V_d = 40 L), but it also concentrates in fat tissues giving instead an apparent V_d of 400 L; therefore, to achieve a given plasma concentration of amiodarone, we dose as though the drug distributes into 400 L of body fluid

Plasma Protein Binding
- drug molecules in the blood exist in an equilibrium of two forms:
  1. bound to plasma protein: acidic drugs bind to albumin, basic drugs bind to α1-acid glycoprotein
  2. free or unbound: can leave the circulation to distribute into tissues and exert an effect, subject to metabolism and elimination
- bound fraction is determined by drug concentration, binding affinity, and plasma protein concentration (number of binding sites)
- reduced number of binding sites (e.g. hypoalbuminemia) or saturation of binding sites (e.g. competition/displacement) may result in increased concentration of free drug, which is often metabolized with no harmful effects, although toxicity is possible

Depots
- a body compartment in which drug molecules tend to be stored and released slowly over a long period of time
- fat is a depot for very lipid soluble drugs (e.g. diazepam)
- some oil-based medications are injected IM for slow release (e.g. depot medroxyprogesterone acetate q3mo; depot risperidone q2wk)

Barriers (relative)
- body structures that limit or prevent diffusion of drug molecules, such as the placenta or BBB (a barrier composed of tight junctions between capillary endothelial cells and astrocytes)
- many of these barriers result, in part, from the activity of multidrug efflux pumps (e.g. Pgp), which serve as a natural defense mechanism against drugs and xenobiotics
- need to consider dosing route if drugs are meant to cross these barriers

Metabolism (Biotransformation)
- definition: chemical transformation of a drug in vivo to enhance elimination
- sites of biotransformation: liver (main), GI tract, lung, plasma, kidney
- as a result of the process of biotransformation:
  - an inactive prodru may be activated (e.g. tamoxifen to endoxifen; codeine to morphine)
  - a drug may be changed to another active metabolite (e.g. diazepam to oxazepam)
  - a drug may be changed to a toxic metabolite (e.g. meperidine to normeperidine)
  - a drug may be inactivated (most drugs)

Drug Metabolizing Pathways
- phase I (P450) reactions
  - minor molecular changes introduce or unmask polar groups on a parent compound to increase water solubility (e.g. oxidation-reduction, hydrolysis, hydroxylation); the change in P=0 is typically minimal compared to phase II, and often phase I places a polar ‘handle’ on a lipophilic drug to allow for phase II
  - mediated by CYPs found in the endoplasmic reticulum
  - product of the reaction can be excreted or undergo further phase II reactions
- phase II (conjugation) reactions
  - conjugation with large polar endogenous substrates (e.g. glucuronidation, glutathione conjugation, sulfation)
  - dramatically increases water solubility and renal elimination
  - can result in biologically active metabolites (e.g. glucuronides of morphine)
  - can occur independently of phase I reactions
Factors Affecting Drug Biotransformation

- genetic polymorphisms of metabolizing enzymes
  - individual genotypes may determine rate of drug metabolism (e.g. poor, intermediate, extensive, or ultrarapid metabolizers)
  - may lead to toxicity or ineffectiveness of a drug at a normal dose
    - tamoxifen and codeine are prodrugs activated by CYP2D6 (nonfunctional alleles reduce effectiveness, whereas overactive/duplicated alleles impart “ultra-rapid metabolizer” phenotype)
    - warfarin is metabolized by CYP2C9 (nonfunctional alleles lead to greater effect and lower dose requirements)
- enzyme inhibition may sometimes be due to other drugs
  - CYP inhibition leads to an increased concentration and bioavailability of the substrate drug (e.g. erythromycin [CYP3A4 inhibitor], can predispose patients to simvastatin toxicity [metabolized by CYP3A4])
- enzyme induction
  - certain medications enhance gene transcription leading to an increase in the activity of a metabolizing enzyme
  - a drug may induce its own metabolism (e.g. carbamazepine) or that of other drugs (e.g. phenobarbital can induce the metabolism of OCPs) by inducing the CYP system
- liver dysfunction (e.g. hepatitis, alcoholic liver, biliary cirrhosis, or hepatocellular carcinoma) may decrease drug metabolism but this may not be clinically significant due to the liver's reserve capacity
- renal disease often results in decreased drug clearance
- extremes of age (neonates or elderly) have reduced biotransformation capacity, and doses should be adjusted accordingly
- nutrition: insufficient protein and fatty acid intake decreases CYP biotransformation, and vitamin/mineral deficiencies may also impact other metabolizing enzymes
- alcohol: while acute alcohol ingestion inhibits CYP2E1, chronic consumption can induce CYP2E1 and increase risk of hepatocellular damage from acetaminophen by increasing the generation of acetaminophen's toxic metabolite
- smoking can induce CYP1A2, thus increasing the metabolism of some drugs (e.g. theophylline, antipsychotic)

Elimination

- definition: removal of drug from the body

Routes of Drug Elimination

- kidney (main organ of elimination): two mechanisms
  1. glomerular filtration
     - a passive process, so that only the free drug fraction can be eliminated
     - drug filtration rate depends on GFR, degree of protein binding of drug, and size of drug
  2. tubular secretion
     - an active process that is saturable allowing both protein-bound and free drug fractions to be excreted
     - distinct transport mechanisms for weak acids (e.g. penicillin, salicylic acid, probenecid, chlorothiazide) and weak bases (e.g. quinine, quaternary ammonium compounds such as choline)
     - drugs may competitively block mutual secretion if both use the same secretion system (e.g. probenecid can reduce the excretion of penicillin)

- tubular reabsorption: drugs can be passively reabsorbed back to the systemic circulation, countering elimination mechanisms
- renal function (decreases with age and is affected by many disease states) is assessed clinically using serum Cr levels
- stool: some drugs and metabolites are actively excreted in the bile or directly into the GI tract
- enterohepatic reabsorption counteracts stool elimination, and can prolong the drug's duration in the body
  - some glucuronide conjugates that are excreted in bile may be hydrolyzed in the intestines by bacteria back to their original form and can be systemically reabsorbed
- lungs: elimination of anesthetic gases and vapours by exhalation
- saliva: saliva concentrations of some drugs parallel their plasma levels (e.g. rifampin)
Pharmacokinetic Calculation

- definition: the quantitative description of the rates of the various steps of drug disposition (i.e. how drugs move through the body)
- the pharmacokinetic principles of ADME (absorption, distribution, metabolism, and elimination) can be graphically represented on a concentration vs. time graph

Time Course of Drug Action
- many kinetic parameters are measured using IV dosing, such that absorption is immediate and distribution for most drugs is rapid; thus elimination is the main process being measured
- the concentration axis is converted to a log10 concentration to allow for easier mathematical calculations
- drugs such as warfarin can exhibit hysteresis where a delayed pharmacological response results from a series of biological events upon the drug interacting with a specific receptor at the effect site

Half-Life
- definition: time taken for the serum drug level to fall 50% during elimination
- drugs with first order kinetics require five half-lives to reach steady state with repeated dosing or for complete drug elimination once dosing is stopped

<table>
<thead>
<tr>
<th># of Half-Lives</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>3.3</th>
<th>4</th>
<th>5</th>
</tr>
</thead>
<tbody>
<tr>
<td>% of Steady State Concentration</td>
<td>50</td>
<td>75</td>
<td>87.5</td>
<td>90</td>
<td>93.8</td>
<td>96.9</td>
</tr>
</tbody>
</table>

Steady State
- drug concentration remains constant when amount of drug entering the system is eliminated from the system
- appropriate timing is important for therapeutic monitoring since drug levels are reliable only when the drug has reached steady state
- special situations
  - use a loading dose for drugs with a long half-life and when there is clinical need to rapidly achieve therapeutic levels (e.g. amiodarone, digoxin, phenytoin)
  - use continuous infusion for drugs with a very short half-life and when there is need for a long-term effect or multiple or frequently repeated doses are too inconvenient (e.g. nitroprusside, insulin, unfractionated heparin)

Clearance
- a quantitative measurement of the body fluid volume from which a substance is removed per unit time
- CI = rate of elimination of drug / plasma drug concentration
- must consider CI from a specific part of the body and total body CI

Elimination Kinetics
- first-order kinetics (most common type)
  - constant fraction of drug eliminated per unit time
  - some drugs can follow first-order kinetics until elimination is saturated (usually at large doses) at which point the CI decreases
  - becomes linear relationship when plotted on a log(concentration) vs. time graph
- zero-order kinetics (less common, associated with overdose, e.g. alcohol)
  - a constant rate of drug eliminated regardless of concentration; concept of half-life does not apply
  - the concentration axis is converted to a log (concentration) to allow for easier mathematical calculations

Table 2. Loading vs. Maintenance Dosing

<table>
<thead>

<tbody>
<tr>
<td>Use when you need an IMMEDIATE effect</td>
<td>After a loading dose OR beginning with maintenance doses</td>
</tr>
<tr>
<td>Often parenteral medication</td>
<td>Steady-state levels achieved after ~5 half-lives</td>
</tr>
<tr>
<td>Rationale: give large dose of medication to “fill up” the volume of distribution</td>
<td>Can be given as either a continuous infusion (relatively rare, short half-life drug) OR much more commonly as intermittent doses</td>
</tr>
</tbody>
</table>

Figure 2. Time course of drug action
For most drugs it takes 5 half-lives to reach steady state with repeated dosing or to eliminate a drug once dosing is stopped

Figure 3. Steady state of a drug displaying first-order kinetics
Steady state of a drug with t1/2 of 3 h. It takes about 15 h (5 x t1/2) to reach steady state.

Dosing interval = 6 h

Steady State at 5 t1/2

Figure 4. First and zero order kinetics
In first order kinetics (solid line), a constant fraction of the drug is eliminated per unit time; in zero order kinetics (dashed line), a constant amount of the drug is eliminated per unit time

Principles of Pharmacokinetics
- $V_d =$ amount of drug in the body / plasma drug concentration
- $Cl =$ rate of elimination of drug/plasma drug concentration
- $Half-life (t_{1/2}) = \frac{0.7xV_d}{Cl}$
Pharmacodynamics

• study of “what the drug does to the body”

Dose-Response Relationship

• graded dose-response relationships: relates dose to intensity of effect

Efficacy

• the maximum biological response produced by a drug
• measured by $E_{\text{max}}$ (the maximal response that a drug can elicit in a RCT or under optimal circumstances)

Potency

• measured by $EC_{50}$ (the concentration of a drug needed to produce 50% of $E_{\text{max}}$)
• a drug that reaches its $EC_{50}$ at a lower dose is more potent

Efficacy vs. Potency

• Efficacy measures the maximal effect of a drug
• Potency measures the concentration of a drug needed to produce a certain effect

Effects of Drugs on Receptors

Agonists

• drugs that mimic the effects of the endogenous ligand and evoke a response when bound to the receptor
  ▪ affinity: the ability of the agonist to bind to the receptor (e.g. the $\beta_2$-agonist salbutamol has greater affinity for $\beta_2$-receptors than $\beta_1$-receptors)
  ▪ efficacy: the ability to recapitulate endogenous response via the receptor interaction (e.g. binding of salbutamol to $\beta_2$-receptors results in smooth muscle relaxation)
• full agonists: can elicit a maximal effect at a receptor
• partial agonists: can only elicit a partial effect, no matter the concentration at the receptor (i.e. reduced efficacy compared to full agonists) (e.g. varenicline is a partial agonist of the $\alpha_4\beta_2$ nicotinic receptor)

Antagonists

• drugs that block the action of an agonist or of an endogenous ligand
• chemical antagonism: direct chemical interaction between agonist and antagonist prevents agonist-receptor binding (e.g. chelating agents for removal of heavy metals)
• functional antagonism: two agonists that act independently at different receptors and have opposite physiological effects (e.g. acetylcholine at the muscarinic receptor compared to epinephrine at the adrenergic receptor)
• reversible and irreversible competitive antagonism
  ▪ drugs that have affinity but no efficacy for their cognate receptors, and therefore, exert no effect upon binding
  ▪ reversible competitive antagonists reversibly bind to the same receptor as the agonist, thus displacing it (e.g. naloxone is an antagonist to morphine or heroin)
  ▪ irreversible antagonists irreversibly bind to the same receptor as the agonist, blocking it from binding (e.g. phenoxybenzamine forms a covalent bond with adrenergic receptors preventing adrenaline and NE from binding)
• non-competitive antagonism
  ▪ antagonist binds to an alternate site near the agonist site, producing allosteric effects that change the ability of the agonist to bind (e.g. organophosphates irreversibly bind acetylcholinesterase)
Figure 8. Mechanism of agonists and antagonists

Effectiveness and Safety

Effectiveness
- ED\textsubscript{50} (effective dose): the dose of a drug needed to cause a therapeutic effect in 50% of a test population of subjects

Safety
- LD\textsubscript{50} (lethal dose): the dose of a drug needed to cause death in 50% of a test population of subjects
- TD\textsubscript{50} (toxic dose): the dose needed to cause a harmful effect in 50% of a test population of subjects

Therapeutic Indices

Therapeutic Index: TD\textsubscript{50}/ED\textsubscript{50}
- reflects the “margin of safety” for a drug – the likelihood of a therapeutic dose to cause serious toxicity or death
- the larger the TI, the safer a drug (e.g. warfarin has a narrow TI and require drug monitoring)
- factors that can change the TI
  - presence of interacting drugs
  - changes in drug ADME

Certain Safety Factor: TD\textsubscript{1}/ED\textsubscript{99}
- >1 translates to a dose effective in at least 99% of the population and toxic in less than 1% of the population
Therapeutic Drug Monitoring

- **definition**: using serum drug concentration data to optimize drug therapy (e.g. dose adjustment, monitor compliance)
  - serum drug samples are usually taken when the drug has reached steady state (after approximately 5 half-lives)
  - TDM is often used for drugs that have: narrow TIs, unpredictable dose-response relationships, significant consequences associated with therapeutic failure or toxicity, and wide inter-patient pharmacokinetic variability

Adverse Drug Reactions

<table>
<thead>
<tr>
<th>Classification</th>
<th>Definition</th>
<th>Characteristics</th>
</tr>
</thead>
<tbody>
<tr>
<td>A (Augmented)</td>
<td>Dose related</td>
<td>• Predictable extension of drug’s pharmacologic effect (e.g. &amp;-blockers causing bradycardia) • &gt;80% of all ADRs</td>
</tr>
<tr>
<td>B (Bizarre)</td>
<td>Non-dose related</td>
<td>• Reactions unrelated to the known pharmacological actions of the drug • Examples include: drug hypersensitivity syndromes, immunologic reactions (penicillin hypersensitivity), and idiosyncratic reactions (malignant hyperthermia)</td>
</tr>
<tr>
<td>C (Chronic)</td>
<td>Dose and time related</td>
<td>• Related to cumulative doses • Effects are well-known and can be anticipated (e.g. atypical femoral fracture from bisphosphonates)</td>
</tr>
<tr>
<td>D (Delayed)</td>
<td>Time related</td>
<td>• Occurs some time after use of drug (e.g. carcinogen) • May also be dose-related</td>
</tr>
<tr>
<td>E (End of use)</td>
<td>Withdrawal</td>
<td>• Occurs after cessation of drug use (e.g. opiate withdrawal)</td>
</tr>
</tbody>
</table>

Approach to Suspected Adverse Drug Reactions

- history and physical exam: signs and symptoms of reaction (e.g. rash, fever, hepatitis, anaphylaxis), timing, risk factors, detailed medication history including all drugs and timing, de-challenge (response when drug is removed), and re-challenge (response when drug is given again)
- differentiate between drug therapy vs. disease pathophysiology
- treatment: stop the drug, supportive care, symptomatic relief
- resources: check recent literature, Health Canada, and FDA; contact the pharmaceutical company; call Poison Control (1-888-268-9017) if overdose or poisoning suspected; check with Motherisk (www.motherisk.org) in cases involving pregnant or breastfeeding women
- report all suspected ADRs that are: 1) unexpected, 2) serious, or 3) reactions to recently marketed drugs (on the market <5 yr) regardless of nature or severity
- Canadian Adverse Drug Reaction Monitoring Program available for online reporting

Examples of drugs whose levels need to be monitored: warfarin (via INR levels), digoxin, lithium, anti-epileptics (e.g. phenytoin, carbamazepine)

</table>
Variability in Drug Response

• recommended patient dosing is based on clinical research and represents mean values for a select population, but each person may be unique in their dosing requirements
• possible causes of individual variability in drug response include problems with:
  ♦ intake: patient adherence
  ♦ pharmacokinetics
    – absorption: vomiting, diarrhea, or steatorrhea; first pass effect increased due to enzyme induction or decreased due to liver disease
    – drug interactions (e.g. calcium carbonate complexes with iron, thyroxine, and fluoroquinolones)
    – distribution: very high or low percentage body fat; intact or disrupted BBB; patient is elderly or a neonate, or has liver dysfunction
    – biotransformation and elimination: certain genetic polymorphisms or enzyme deficiencies related to drug metabolism (e.g. acetylcholinesterase deficiency, CYP polymorphism); kidney or liver dysfunction
  ♦ pharmacodynamics: genetic variability in drug response (e.g. immune-mediated reactions); diseases that affect drug pharmacodynamics; drug tolerance or cross-tolerance

Drug Interactions

• concomitant prescriptions: one drug alters the effect of another by changing its PK and/or PD
• PK interactions involve changes in drug concentration
  ▪ absorption: alterations in gastrointestinal pH, gastric emptying, intestinal motility, gut mucosal function
  ▪ biotransformation: alterations in drug metabolizing enzymes
  ▪ excretion: alterations in renal elimination
• PD interactions are due to two drugs that exert similar effects (additive) or opposing effects (subtractive)
• drug interactions can also involve herbal medications (e.g. St. John’s wort) and food (e.g. grapefruit)

Autonomic Pharmacology

Figure 10. Subdivisions of the peripheral nervous system

• the autonomic nervous system is divided into sympathetic and parasympathetic divisions
• most organs are innervated by both sympathetic and parasympathetic nerves, which have opposing effects (see Neurology, N8)
• ACh and NE are the main neurotransmitters of the autonomic NS
• ACh binds to cholinergic receptors, which include nicotinic and muscarinic receptors
• NE binds to adrenergic receptors, which principally include β1, β2, α1, and α2
• ACh action is terminated by metabolism in the synaptic cleft by acetylcholinesterase and in the plasma by pseudocholinesterase
• acetylcholinesterase inhibitors (pyridostigmine, donepezil, galantamine, rivastigmine) can be used to increase ACh levels in conditions such as myasthenia gravis or Alzheimer’s disease
• NE action is terminated by reuptake by the presynaptic membrane, diffusion from the synaptic cleft, and degradation by monoamine oxidase (MAO) and catechol-O-methyl transferase (COMT)
Parasympathetic Nervous System

- blood vessels, adrenals, sweat glands, spleen capsule, and adrenal medulla do NOT have parasympathetic innervation
- parasympathetic pre-ganglionic fibres originate in the lower brainstem from cranial nerves III, VII, IX, X, and in the sacral spinal cord at levels S2-S4 and connect with post-ganglionic fibres via nicotinic receptors in ganglionic cells located near or within the target organ
- post-ganglionic fibres connect with effector tissues via:
  - $M_1$ muscarinic receptors located in the CNS
  - $M_2$ muscarinic receptors located in smooth muscle, cardiac muscle, and glandular epithelium

Sympathetic Nervous System

- sympathetic pre-ganglionic fibres originate in the spinal cord at spinal levels T1-L3
- pre-ganglionic fibres connect with post-ganglionic fibres via nicotinic receptors located in one of two groups of ganglia
  1. paravertebral ganglia (i.e. the sympathetic trunk) that lie in a chain close to the vertebral column
  2. pre-vertebral ganglia (i.e. celiac and mesenteric ganglia) that lie within the abdomen
- post-ganglionic fibres connect with effector tissues via
  - $\beta_1$ receptors in cardiac tissue
  - $\beta_2$ receptors in smooth muscle of bronchi and GI tract
  - $\alpha_1$ receptors in vascular smooth muscle
  - $\alpha_2$ receptors in vascular smooth muscle
  - $M_3$ muscarinic receptors located in sweat glands

Introduction to Skin

Skin Anatomy

Figure 1. Histologic layers of the skin. Epidermal layer is detailed in A

- Epidermis
  - avascular: receives its nutrition from the dermal capillaries
  - derived from keratinocytes with the youngest presenting at the stratum basale
  - cells progress from stratum basale to stratum corneum in about 4 wk
    - stratum basale (germinativum): mitotic figures that give rise to keratinocytes
    - stratum spinosum (prickle cells): junctions in this layer (tonofilaments) give the epidermis its strength
    - stratum granulosum: flat cells containing basophilic granules which characterize skin
    - stratum lucidum: comprised of transparent layers of packed dead cells
    - stratum corneum: flat scales of the water-resistant protein keratin
  - cells of the epidermis
    - keratinocytes: located in all layers of the epidermis, except the stratum corneum; connected to each other by desmosomes
    - melanocytes: located in the stratum basale; keratinocyte to melanocyte ratio in the basal layer is 10:1; melanocyte number is equal among races; produces melanosomes containing melanin, which are transferred to keratinocytes
    - Merkel cells: located in the basal layer; involved in touch sensation
  - dermis: comprised of connective tissue divided into two regions
    - papillary: contains numerous capillaries that supply nutrients to the dermis and epidermis
    - reticular: provides a strong structure for skin; consists of collagen bundles woven together along with elastic fibres, fibroblasts, and macrophages
    - cells of dermis
    - fibroblasts: produces collagen, elastin, and ground substance
    - mast cells: releases histamines which mediate type I hypersensitivity
- Subcutaneous tissue (subdermal)
  - consists primarily of adipose cells, larger caliber vessels, nerves and fascia

Epidermal Appendages
- epidermal in origin, can extend into the dermis; includes hair, nails, and cutaneous glands
- pilosebaceous unit = hair + hair follicle + sebaceous gland + arrector pili muscle

Cutaneous Glands
- sebaceous gland: part of pilosebaceous unit, produces sebum which is secreted into the hair follicle via the sebaceous duct, where it covers the skin surface (protective function)
  - sebum has some antifungal properties
  - these glands cover entire skin surface and are absent only in non-hair bearing areas (e.g. palms, soles, lips)
- apocrine sweat gland: apocrine duct empties into hair follicle above sebaceous gland
  - found in axillae and perineum
  - likely a vestigial structure, functions in other species to produce scent (e.g. pheromones)
- eccrine sweat gland: not part of pilosebaceous unit
  - found over entire skin surface except lips, nail beds, and glans penis
  - important in temperature regulation via secretion of sweat to cool skin surface

Acronyms

- hCG: human chorionic gonadotropin
- AAFP: American Academy of Family Physicians
- AD: atopic dermatitis
- AK: actinic keratosis
- AS: anti-Streptolysin O
- BCC: basal cell carcinoma
- BSA: body surface area
- Brun: blood urea nitrogen
- CBC: complete blood count
- CMV: cytomegalovirus
- CNS: central nervous system
- Cr: creatinine
- CXR: chest x-ray
- DLE: discoid lupus erythematosus
- DM: diabetes mellitus
- DVT: deep vein thrombosis
- EM: erythema multiforme
- Fe: iron
- FTA-ABS: fluorescent treponemal antibody-absorption test
- GAS: group A beta-hemolytic Streptococcus
- GVRD: graft-versus-host disease
- HHV: human herpes virus
- HIPA: hypopituitary-adrenal
- HPV: human papillomavirus
- HRT: hormone replacement therapy
- HSV: herpes simplex virus
- HDV: herpes zoster virus
- IFN: interferon
- IVlg: intravenous immunoglobulin
- IFT: liver function test
- MADD: monamine oxidase inhibitor
- MM: malignant melanoma
- MMR: measles/mumps/rubella
- MRSA: methicillin-resistant Staphylococcus aureus
- MTP: metatarsal phalangeal
- NB-UVB: narrow band ultraviolet wavelength B
- NCT: neocellular neus
- Nd:Yag: neodymium-doped yttrium aluminum garnet
- NNM: neovernelanocytic neus
- NMSC: nonmelanoma skin cancers
- NSAAID: nonsteroidal anti-inflammatory drug
- OCP: oral contraceptive pill
- OTC: over-the-counter
- PABA: para-aminobenzoic acid
- PASI: Psoriasis Area and Severity Index
- PPD: purified protein derivative
- PUVA: psoralens and long wave ultraviolet radiation
- RA: rheumatoid arthritis
- SCC: squamous cell carcinoma
- SHBG: sex hormone-binding globulin
- SJS: Stevens-Johnson syndrome
- SLE: systemic lupus erythematosus
- SPF: sun protection factor
- SSG: selective serotonin reuptake inhibitor
- SSSS: staphylococcal scalded skin syndrome
- STI: sexually transmitted infection
- TB: tuberculosis
- TEN: toxic epidermal necrolysis
- TMP/SMX: trimethoprim-sulfamethoxazole
- TSH: thyroid stimulating hormone
- UC: ulcerative colitis
- URI: upper respiratory tract infection
- UV: ultraviolet
- UVA: ultraviolet wavelength A
- UVB: ultraviolet wavelength B
- JVC: ultraviolet wavelength C
- VDRL: venereal disease research laboratory
- VZV: varicella zoster virus
Skin Function

- **protection**
  - due to continuous recycling and avascularity of epidermis
  - barrier to UV radiation, mechanical/chemical insults, pathogens, and dehydration
- **thermal regulation**
  - insulation to maintain body temperature in cool environments via peripheral vasoconstriction, hair, and subcutaneous adipose tissue
  - dissipation of heat in warm environments via increased activity of sweat glands and increased blood flow within dermal vascular networks
- **sensation**
  - touch, pain, and temperature sensation
- **metabolic function**
  - vitamin D synthesis
  - energy storage (mainly in the form of triglycerides)

Definitions

Primary Morphological Lesions

**Definition**
- an initial lesion that has not been altered by trauma or manipulation and has not regressed

<table>
<thead>
<tr>
<th>Profile</th>
<th>&lt;1 cm Diameter</th>
<th>≥1 cm Diameter</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>

Secondary Morphological Lesions

**Definition**
- develop during the evolutionary process of skin disease, or created by manipulation, or due to complication of primary lesion (e.g. rubbing, scratching, infection)
- **crust**: dried fluid (serum, blood, or purulent exudate) originating from a lesion (e.g. impetigo)
- **scale**: excess keratin (e.g. seborrheic dermatitis)
- **lichenification**: thickening of the skin and accentuation of normal skin markings (e.g. chronic atopic dermatitis)
- **fissure**: a linear slit-like cleavage of the skin
- **excoriation**: a scratch mark
- **erosion**: a disruption of the skin involving the epidermis alone; heals without scarring
- **ulcer**: a disruption of the skin that extends into the dermis or deeper; heals with scarring
- **xerosis**: pathologic dryness of skin (xeroderma), conjunctiva (xerophthalmia), or mucous membranes
- **atrophy**: histological decrease in size and number of cells or tissues, resulting in thinning or depression of the skin
Other Morphological Lesions

- **cyst**: an epithelial-lined collection containing semi-solid or fluid material
- **pustule**: an elevated lesion containing purulent fluid (white, grey, yellow, green)
- **scar**: replacement fibrosis of dermis and subcutaneous tissue (hypertrophic or atrophic)
- **wheal**: a special form of papule or plaque that is transient (<24 h) and blanchable often with a halo and central clearing, formed by edema in the dermis (e.g. urticaria)
- **comedones**: collection of sebum and keratin
  - open comedo (blackhead)
  - closed comedo (not a pustule; rather a minute dome shaped skin coloured papule)
- **petechiae**: small pinpoint extravasation of blood into dermis resulting in hemorrhagic lesions; non-blanchable, <3 mm in size
- **purpura**: larger than petechia, 3 mm-1 cm in size
- **ecchymoses**: larger than purpura, >1 cm in size (i.e. a “bruise”)
- **telangiectasia**: dilated superficial blood vessels; often branching and reticulated and of small caliber

Patterns and Distribution

- **acral**: relating to the hands and feet (e.g. perniosis, secondary syphilis)
- **annular**: ring-shaped (e.g. granuloma annulare)
- **follicular**: involving hair follicles (e.g. folliculitis)
- **guttate**: lesions following a “drop-like” pattern (e.g. guttate psoriasis)
- **Koebner phenomenon**: i.e. isomorphic response, appearance of lesions at an injury site (e.g. lichen planus, psoriasis, vitiligo)
- **morbilliform**: literally meaning “measles-like”, an eruption composed of macules and papules with truncal predominance
- **reticular**: lesions following a net-like pattern (e.g. livedo reticularis)
- **satellite**: small lesions scattered around the periphery of a larger lesion (e.g. candida diaper dermatitis)
- **serpiginous**: lesions following a snake-like pattern (e.g. cutaneous larva migrans)
- **target/targetoid**: concentric ring lesions, like a dartboard (e.g. erythema multiforme)
- **other descriptive terms**: discrete, clustered, linear, confluent, dermatitic, indurated (i.e. hard or firm)
Differential Diagnoses of Common Presentations

Table 3. Cysts

<table>
<thead>
<tr>
<th>Clinical Presentation</th>
<th>Pathophysiology</th>
<th>Epidemiology</th>
<th>Clinical Course</th>
<th>Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>Epidermal Cyst</td>
<td>Round, yellow/flesh-coloured, slow growing, mobile, firm, fluctuant, nodule or tumour</td>
<td>Epithelial cells displaced into dermis, epidermal lining becomes filled with keratin and lipid-rich debris May be post-traumatic, rarely syndromic</td>
<td>Most common cutaneous cyst in youth – mid age</td>
<td>Central punctum may rupture (foul, cheesy odour, creamy colour) and produce inflammatory reaction Increase in size and number over time, especially in pregnancy Excise completely before it becomes infected</td>
</tr>
<tr>
<td>Pilary Cyst (Trichilemmal)</td>
<td>Multiple, hard, variable sized nodules under the scalp, lacks central punctum</td>
<td>Thick-walled cyst lined with stratified squamous epithelium and filled with dense keratin Idiopathic Post-trauma, often familial</td>
<td>2nd most common cutaneous cyst F&gt;M</td>
<td>Rupture causes pain and inflammation Excision</td>
</tr>
<tr>
<td>Dermoid Cyst</td>
<td>Firm nodule most commonly found at lateral third of eyebrow or midline under nose</td>
<td>Rare, congenital hamartomas, which arise from inclusion of epidermis along embryonal cleft closure lines, creating a thick-walled cyst filled with dense keratin</td>
<td>Rare</td>
<td>If nasal midline, risk of extension into CNS Excision</td>
</tr>
<tr>
<td>Ganglion Cyst</td>
<td>Usually solitary, rubbery, translucent; a clear gelatinous viscous fluid may be extruded</td>
<td>Cystic lesion that originates from joint or tendon sheath, called a digital mucous cyst when found on fingertip Associated with osteoarthrits</td>
<td>Older age</td>
<td>Stable Incision and expression of contents Laser ablation and electrodessication</td>
</tr>
<tr>
<td>Milium</td>
<td>1-2 mm superficial, white to yellow subepidermal papules occurring on eyelids, cheeks, and forehead</td>
<td>Small epidemoid cyst, primarily arising from pluripotential cells in epidermal or adnexal epithelium Can be secondary to blistering, ulceration, trauma, topical corticosteroid atrophy, or cosmetic procedures</td>
<td>Any age 40-50% of infants</td>
<td>In newborns, spontaneously resolves in first 4 wk of life Incision and expression of contents Laser ablation and electrodessication Multiple facialis milia respond to topical retinoid therapy</td>
</tr>
</tbody>
</table>
Fibrous Lesions

dermatofibroma

Clinical Presentation
- button-like, firm dermal papule or nodule, skin-coloured to red-brown colouring
- majority are asymptomatic but may be pruritic and/or tender
- site: legs > arms > trunk
- dimple sign (Fitzpatrick's sign): lateral compression causes dimpling of the lesion

Pathophysiology
- benign tumour due to fibroblast proliferation in the dermis

Etiology
- unknown; may be associated with history of minor trauma (e.g. shaving or insect bites)
- eruptive dermatofibromata can be associated with SLE

Epidemiology
- adults, F>M

Differential Diagnosis
- dermatofibrosarcoma protruberans, MM, Kaposi's sarcoma, blue nevus

Investigations
- biopsy if diagnosis is uncertain

Management
- no treatment required
- excision or cryosurgery if bothersome

Skin Tags

Clinical Presentation
- small (1-10 mm), soft, skin-coloured or darker pedunculated papule, often polypoid
- sites: eyelids, neck, axillae, inframammary, and groin

Pathophysiology
- benign outgrowth of skin

Epidemiology
- middle-aged and elderly, F>M, obese, can increase in size and number during pregnancy

Differential Diagnosis
- pedunculated seborrhoeic keratosis, compound or dermal melanocytic nevus, neurofibroma, fibroepithelioma of Pinkus (rare variant of BCC)

Management
- excision, electrodessication, cryosurgery

Hyperkeratotic Lesions

Seborrhoeic Keratosis

Clinical Presentation
- well-demarcated waxy papule/plaque with classic "stuck on" appearance
- rarely pruritic
- over time lesions appear more warty, greasy and pigmented
- sites: face, trunk, upper extremities (may occur at any site except palms or soles)

Pathophysiology
- very common benign epithelial tumour due to proliferation of keratinocytes and melanocytes

Epidemiology
- unusual <30 yr old
- M>F
- autosomal dominant inheritance

Differential Diagnosis
- MM (lentigo maligna, nodular melanoma), melanocytic nevi, pigmented BCC, solar lentigo, spreading pigmented AK
Investigations
• biopsy only if diagnosis uncertain

Management
• none required, for cosmetics only
• cryotherapy, curettage

ACTINIC KERATOSIS (SOLAR KERATOSIS)
• see Pre-Malignant Skin Conditions, D31

KERATOACANTHOMA
• see Malignant Skin Tumours, D32

Corns

Clinical Presentation
• firm papule with a central, translucent, cone-shaped, hard keratin core
• painful with direct pressure
• sites: most commonly on dorsolateral fifth toe and dorsal aspects of other toes

Pathophysiology
• localized hyperkeratosis induced by pressure on hands and feet

Epidemiology
• F>M, can be caused by chronic microtrauma

Differential Diagnosis
• tinea pedis, plantar warts

Management
• relieve pressure with padding or alternate footwear, orthotics
• paring, curettage

Keloids

Clinical Presentation
• firm, shiny, skin-coloured or red-bluish papules/nodules that most often arise from cutaneous injury (e.g. piercing, surgical scar, acne), but may appear spontaneously
• extends beyond the margins of the original injury, and may continue to expand in size for years with claw-like extensions
• can be pruritic and painful
• sites: earlobes, shoulders, sternum, scapular area

Pathophysiology
• excessive deposition of randomly organized collagen fibres following trauma to skin

Epidemiology
• most common in black patients, followed by those of Asian descent (predilection for darker skin)
• M=F, all age groups

Management
• intralesional corticosteroid injections
• cryotherapy
• silicone compression

Corns vs. Warts vs. Calluses
• Corns have a whitish yellow central translucent keratinous core; painful with direct pressure
• Warts bleed with paring and have a black speckled central appearance due to thrombosed capillaries; plantar warts destroy dermatoglyphics (epidermal ridges)
• Calluses have layers of yellowish keratin revealed with paring; there are no thrombosed capillaries or interruption of epidermal ridges

Keloids vs. Hypertrophic Scars
• Keloids: extend beyond margins of original injury with claw-like extensions
• Hypertrophic scars: confined to original margins of injury
**Pigmented Lesions**

**CONGENITAL NEVOMELANOCYTIC NEVI (CNMN)**

**Clinical Presentation**
- sharply demarcated pigmented papule or plaque with regular borders ± coarse hairs
- classified by size: small (<1.5 cm), medium (M1: 1.5-10 cm, M2: >10-20 cm), large (L1: >20-30 cm, L2 >30-40 cm), giant (G1: >40-60 cm, G2: >60 cm)
- may be surrounded by smaller satellite nevi

**Pathophysiology**
- nevomelanocytes in epidermis (clusters) and dermis (strands)

**Epidemiology**
- present at birth or develops in early infancy to childhood
- malignant transformation is rare (1-5%) and more correlated with size of the lesion
- neurocutaneous melanosis can occur in giant CNMN (melanocytes in the central nervous system)

**Management**
- surgical excision if suspicious, due to increased risk of melanoma
- MRI if suspicious for neurological involvement

**OTHER CONGENITAL PIGMENTED LESIONS**

<table>

</tr>
<tr>
<td>Dermal Melanocytosis (historically known as Mongolian Spot)</td>
</tr>
</tbody>
</table>

**ACQUIRED NEVOMELANOCYTIC NEVI**

**Clinical Presentation**
- common mole: well circumscribed, round, uniformly pigmented macules/papules <1.5 cm
- average number of moles per person: 18-40
- 3 stages of evolution: junctional NMN, compound NMN, and dermal NMN

**Table 5. Evolution of Acquired Nevomelanocytic Nevii**

<table>
<thead>
<tr>
<th>Type</th>
<th>Age of Onset</th>
<th>Clinical Presentation</th>
<th>Histology</th>
</tr>

<tr>
<td>Compound</td>
<td>Any age</td>
<td>Dome, regularly bordered, smooth, round, tan-dark brown papule</td>
<td>Melanocytes at dermal-epidermal junction; migration into dermis</td>
</tr>
<tr>
<td>Dermal</td>
<td>Adults</td>
<td>Soft, dome-shaped, skin-coloured to tan/brown papules or nodules, often with telangiectasia</td>
<td>Melanocytes exclusively in dermis</td>
</tr>
</tbody>
</table>

**DDx of Hyperpigmented Macules**
- Purpura (e.g. solar, ASA, anti-coagulants, steroids, hemosiderin stain)
- Post-inflammatory
- Melasma
- Melanoma
- Fixed drug eruption

**Other Nevii**
- Halo nevus: often a typical appearing nevus surround by a ring of depigmentation; not rare in children; uncommonly associated with vitiligo; no treatment required unless irregular colour or borders
- Blue nevus: round to oval macule/papule with homogenous blue to blue-black colour; often appears in childhood and late adolescence; no treatment required unless atypical features are noted
Management

- new or changing pigmented lesions should be evaluated for atypical features which could be indicative of melanoma
- excisional biopsy can be considered if the lesion demonstrates asymmetry, varied colours, irregular borders, pruritis or persistent bleeding

OTHER ACQUIRED PIGMENTED LESIONS

HEMANGIOMAS

Clinical Presentation

- red or blue subcutaneous mass that is soft/compressible, blanches with pressure; feels like a “bag of worms” when palpated

Pathophysiology

- benign vascular tumour
- includes: cavernous hemangioma, capillary/infantile hemangioma, spider hemangioma

A spider angioma will blanch when the tip of a paperclip is applied to the centre of the lesion.
### Table 8. Vascular Tumours

<tr>
<td>Nevus Flammeus (Port-wine stain)</td>
<td>Red to blue macule present at birth that follows a dermatomal distribution, rarely crosses midline</td>
<td>Congenital vascular malformation of dermal capillaries; rarely associated with Sturge-Weber syndrome (V1, V2 distribution)</td>
<td>Laser or make-up</td>
</tr>
<tr>
<td>Nevus Simplex (salmon patch)</td>
<td>Pink-red irregular patches</td>
<td>Congenital dilation of dermal capillaries</td>
<td>No treatment required</td>
</tr>
</tbody>
</table>

### Lipoma

**Clinical Presentation**
- single or multiple non-tender subcutaneous tumours that are soft and mobile
- occurs most frequently on the trunk, and extremities but can be anywhere on the body

**Pathophysiology**
- adipocytes enclosed in a fibrous capsule

**Epidemiology**
- often solitary or few in number, if multiple can be associated with rare syndromes

**Differential Diagnosis**
- angiolipoma, liposarcoma

**Investigations**
- biopsy only if atypical features (painful, rapid growth, firm)

**Management**
- reassurance
- excision or liposuction only if desired for cosmetic purposes
Acneform Eruptions

Acne Vulgaris/Common Acne

Clinical Presentation
• A common inflammatory pilosebaceous disease categorized with respect to severity
  ▪ Type I: comedonal, sparse, no scarring
  ▪ Type II: comedonal, papular, moderate ± little scarring
  ▪ Type III: comedonal, papular, and pustular, with scarring
  ▪ Type IV: nodulocystic acne, risk of severe scarring
• Sites of predilection: face, neck, upper chest, and back

Pathophysiology
• Hyperkeratinization at the follicular ostia (opening) blocks the secretion of sebum leading to the formation of microcomedones
• Androgens promote excess sebum production
• Propionibacterium acnes metabolize sebum to free fatty acids and produces pro-inflammatory mediators

Epidemiology
• Age of onset in puberty (10-17 yr in females, 14-19 yr in males)
• In prepubertal children consider underlying hormonal abnormality (e.g. late onset congenital adrenal hyperplasia)
• More severe in males than in females
• Incidence decreases in adulthood
• Genetic predisposition: majority of individuals with cystic acne have parent(s) with history of severe acne

Differential Diagnosis
• Folliculitis, keratosis pilaris (upper arms, face, thighs), perioral dermatitis, rosacea

Table 10. Management of Acne

</tr>
<tr>
<td>Cyproterone acetate-ethinyl estradiol</td>
<td>Diane-35®</td>
<td>After 35 yr of age, estrogen/progesterone should only be considered in exceptional circumstances, carefully weighing the risk/benefit ratio with physician guidance</td>
</tr>
<tr>
<td>Spironolactone (source ADA)</td>
<td>Aldactone</td>
<td>May cause hyperkalemia at higher doses. Black box warning for breast cancer</td>
</tr>
</tbody>
</table>

Acne Myths Debunked
• Eating greasy food and chocolate does not cause or worsen acne
• Blackheads (comedones) are black because of oxidized fatty acids, not dirt
• Acne is not caused by poor hygiene; on the contrary, excessive washing of face can be an aggravator

Acne Exacerbating Factors
• Systemic medications: lithium, phenytoin, steroids, halogens, androgens, iodides, bromides, danazol
• Topical agents: steroids, tars, ointments, oily cosmetics
• Mechanical pressure or occlusion, such as leaning face on hands
• Emotional stress

Antibiotics are used in inflammatory skin conditions since they also have anti-inflammatory properties (e.g. macrolides in acne). Topical antibiotics may also be used to treat secondary bacterial superinfections (e.g. impetigo)

Intralesional Injections
Intralesional corticosteroid injections are effective in the treatment of individual acne nodules

Treatment of Acne Scars
• Tretinoin creams
• Microdermabrasion for superficial scars
• Injectable fillers (collagen, hyaluronic acid)
• Fraxel laser

A combination of topical retinoids and topical erythromycin or clindamycin is more effective than either agent used alone
**Perioral Dermatitis**

**Clinical Presentation**
- discrete erythematous micropapules that often become confluent, forming inflammatory plaques on perioral, perinasal, and periorbital skin
- commonly symmetrical, rim of sparing around vermillion border of lips

**Epidemiology**
- 15-40 yr old, occasionally in younger children
- predominantly females

**Differential Diagnosis**
- contact dermatitis, rosacea, acne vulgaris

**Management**
- avoid all topical steroids
- topical: metronidazole 0.75% gel or 0.75-1% cream to affected area bid
- systemic: tetracycline family antibiotic (utilized for its anti-inflammatory properties)

---

**Rosacea**

**Clinical Presentation**
- dome-shaped inflammatory papules ± pustules
- flushing, non-transient erythema, and telangiectasia
- distribution: typically on central face including forehead, nose, cheeks, and chin; rarely on scalp, neck, and upper body
- characterized by remissions and exacerbations
- exacerbating factors: heat, cold, wind, sun, stress, drinking hot liquids, alcohol, caffeine, spices
- all forms of rosacea can progress from mild to moderate to severe
- rarely in longstanding rosacea, signs of thickening, induration and lymphedema in the skin can develop
  - phyma: a distinct swelling caused by lymphedema and hypertrophy of subcutaneous tissue, particularly affecting the nose (rhinophyma)
  - ocular manifestations: blepharoconjunctivitis, keratitis, iritis

**Pathophysiology**
- unknown

**Epidemiology**
- although found in all skin types, highest prevalence in fair-skinned people
- 30-50 yr old; F>M

**Differential Diagnosis**
- acne vulgaris, seborrheic dermatitis, perioral dermatitis, contact dermatitis

**Management**
- trigger avoidance is key to long-term management
- avoid topical corticosteroids
- telangiectasia: treated by physical ablation; electrical hyfrecators, vascular lasers, and intense pulsed light therapies
- phymas: treated by physical ablation or removal; paring, electrosurgery, cryotherapy, laser therapy (CO2, argon, Nd:YAG)

### Dermatitis (Eczema)

**Definition**
- inflammation of the skin

**Clinical Presentation**
- poorly demarcated erythematous patches or plaques
- symptoms include pruritus and pain
- acute dermatitis: papules, vesicles
- subacute dermatitis: scaling, crusting
- chronic dermatitis: lichenification, xerosis, fissuring

### Asteatotic Dermatitis

**Clinical Presentation**
- diffuse, mild pruritic dermatitis secondary to dry skin
- very common in elderly, especially in the winter (i.e. “winter itch”) but starts in the fall
- shins predominate, looks like a “dried river bed”

**Management**
- skin rehydration with moisturizing routine ± mild corticosteroid creams

### Atopic Dermatitis

**Clinical Presentation**
- subacute and chronic eczematous reaction associated with prolonged severe pruritus
- distribution depends on age
- inflammation, lichenification, excoriation are secondary to relentless scratching
- atopic palms: hyperlinearity of the palms (associated with ichthyosis vulgaris)
- associated with: keratosis pilaris (hyperkeratosis of hair follicles, “chicken skin”), xerosis, occupational hand dryness

**Epidemiology**
- frequently affects infants, children, and young adults
- almost 15% of children in developed countries under the age of 5 are affected
- associated with personal or family history of atopy (asthma, hay fever, anaphylaxis, eosinophilia)
- polygenic inheritance: one parent >60% chance for child; two parents >80% chance for child
- the earlier the onset, the more severe and persistent the disease
- long-term condition with 1/3 of patients continuing to show signs of AD into adulthood

**Pathophysiology**
- a T-cell driven process with epidermal barrier dysfunction

**Investigations**
- clinical diagnosis
- consider: skin biopsy, immunoglobulin serum levels (often elevated serum IgE level), patch testing, and skin prick tests

**Management**
- goal: reduce signs and symptoms, prevent or reduce recurrences/flares
- better outcome (e.g. less flare-ups, modified course of disease) if diagnosis made early and treatment plan individualized
- avoid triggers of AD
- non-pharmacologic therapy
  - moisturizers
    - apply liberally and reapply frequently with goal of minimizing xerosis
    - include in treatment of mild to severe disease as well as in maintenance therapy

### Triggers for Atopic Dermatitis
- Irritants (detergents, solvents, clothing, water hardness)
- Contact allergens
- Environmental aeroallergens (e.g. dust mites)
- Inappropriate bathing habits (e.g. long hot showers)
- Sweating
- Microbes (e.g. S. aureus)
- Stress

![Figure 4. Atopic dermatitis distribution](image)
bathing practices
- bathe in plain warm water for a short period of time once daily followed by lightly but not completely drying the skin with a towel; immediate application of topical agents or moisturizers after this
- use fragrance-free hypoallergenic non-soap cleansers

pharmacologic therapy
- topical corticosteroids
  - effective in reducing acute and chronic symptoms as well as prevention of flares
  - choice of steroid potency depends on age, body site, short vs. long-term use
  - apply 1 adult fingertip unit (0.5 g) to an area the size of 2 adult palms 2x/d for acute flares, and 1-2x/wk for maintenance therapy
  - local side effects: skin atrophy, purpura, telangiectasia, striae, hypertrichosis, and acneform eruption are all very rarely seen
- topical calcineurin inhibitors
  - tacrolimus 0.03%, 0.1% (Protopic®) and pimecrolimus 1% (Elidel®)
  - use as steroid-sparing agents in the long-term
  - advantages over long-term corticosteroid use: rapid, sustained effect in controlling pruritus; safe for the face and neck
  - apply 2x/d for acute flares, and 2-3x/wk to recurrent sites to prevent relapses
  - local side effects: stinging, burning, allergic contact dermatitis
  - U.S. black box warning of malignancy risk: rare cases of skin cancer and lymphoma reported; no causal relationship established

Complications
- infections
  - topical mupirocin or fusidic acid (Canada only, not available in US)
  - oral antibiotics (e.g. cloxacillin, cephalaxin) for widespread S. aureus infections

Initial assessment of disease history, extent, and severity (impact on family, psychological distress)
- Patient education, daily emollient use

Adjunctive therapy
- Avoidance of triggers
- Treat bacterial superinfections (topical or oral antibiotics)
- Antihistamines
- Psychological interventions

Acute control of flare
- Topical corticosteroids or topical calcineurin inhibitor (pimecrolimus or tacrolimus)

Disease remission (no signs or symptoms)
- Use of topical corticosteroid or calcineurin inhibitor at earliest sign of flare
- Long-term maintenance use of calcineurin inhibitors

Maintenance therapy if disease is persistent and/or frequent recurrences
- Use of topical corticosteroid or calcineurin inhibitor at earliest sign of flare
- Long-term maintenance use of calcineurin inhibitors

Severe refractory disease
- Azathioprine
- Methotrexate
- Oral cyclosporin
- Oral steroids
- Phototherapy
- Potent topical steroids
- Psychotherapeutics

Figure 5. Atopic dermatitis treatment algorithm
Contact Dermatitis

Clinical Presentation
• cutaneous inflammation caused by an external agent(s)

Table 12. Contact Dermatitis

<table>
<thead>
<tr>
<th>Mechanism of Reaction</th>
<th>Irritant Contact Dermatitis</th>
<th>Allergic Contact Dermatitis</th>
</tr>
</thead>
<tbody>
<tr>
<td>Acute: quick reaction, sharp margins (e.g. from acid/alkali exposure)</td>
<td>Toxic injury to skin; non-immune mechanism</td>
<td>Cell-mediated delayed (Type IV) hypersensitivity reaction (see Rheumatology, RH2)</td>
</tr>
<tr>
<td>Cumulative insult: slow to appear, poorly defined margins (e.g. from soap), more common</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

| Type of Reaction | Erythema, dryness, fine scale, burning | Erythema with a papulovesicular eruption, swelling, pruritus |

| Frequency | Majority; will occur in anyone given sufficient concentration of irritants | Minority; patient acquires susceptibility to allergen that persists indefinitely |
| Distribution | Hands are the most common site | Areas exposed to allergen |
| Examples | Soaps, weak alkali, detergents, organic solvents, alcohol, oils | Many allergens are irritants, so may coincide with irritant dermatitis |
| Management | Avoidance of irritants, Wet compresses with Burow’s solution, Barrier moisturizers, Topical/oral steroids | Patch testing to determine specific allergen, Avoid allergen and its cross-reactants, Wet compresses soaked in Burow’s solution (drying agent), Steroid cream (e.g. hydrocortisone 1%, betamethasone valerate 0.05% or 0.1% cream; bid), Systemic steroids prn (prednisone 1 mg/kg, taper over 2 wk) |

Dyshidrotic Dermatitis

Clinical Presentation
• “tapioca pudding” papulovesicular dermatitis of hands and feet that coalesce into plaques, followed by painful fissuring
• acute stage often very pruritic
• secondary infection common
• lesions heal with desquamation and may lead to chronic lichenification
• sites: palms and soles ± dorsal surfaces of hands and feet

Pathophysiology
• NOT caused by hyperhidrosis (excessive sweating)
• emotional stress may precipitate flares

Management
• topical: high potency corticosteroid with plastic cling wrap occlusion to increase penetration
• intralesional triamcinolone injection
• systemic:
  ▪ prednisone in severe cases
  ▪ antibiotics for secondary S. aureus infection

Nummular Dermatitis

Clinical Presentation
• annular, coin-shaped, pruritic, dry, scaly, erythematous plaques, can become lichenified
• often associated with atopic and dyshidrotic dermatitis
• secondary infection common

Pathophysiology
• little is known, but it is often accompanied by xerosis, which results from a dysfunction of the epidermal lipid barrier; this in turn can allow permeation of environmental agents, which can induce an allergic or irritant response

Management
• moisturization
• mid to high potency corticosteroid ointment bid
**Seborrheic Dermatitis**

**Clinical Presentation**
- greasy, erythematous, yellow, scaling, minimally elevated papules and plaques in areas rich in sebaceous glands, can look moist and superficially eroded in flexural regions
- infants: “cradle cap”
- children: may be generalized with flexural and scalp involvement
- adults: diffuse involvement of scalp margin with yellow to white flakes, pruritus, and underlying erythema
- sites: scalp, eyebrows, eyelashes, beard, glabella, post-auricular, over sternum, trunk, body folds, genitalia

**Pathophysiology**
- possible etiologic association with *Malassezia* spp. (yeast)

**Epidemiology**
- common in infants and adolescents
- increased incidence and severity in immunocompromised patients
- in adults, can cause dandruff (pityriasis sicca)

**Management**
- face: ketoconazole (Nizoral®) cream daily or bid + mild steroid cream daily or bid
- scalp: salicylic acid in olive oil or Derma-Smoothe FS® lotion (peanut oil, mineral oil, fluocinolone acetonide 0.01%) to remove dense scales, 2% ketoconazole shampoo (Nizoral®), ciclopirox (Stieprox®) shampoo, selenium sulfide (e.g. Selsun®) or zinc pyrithione (e.g. Head and Shoulders®) shampoo, steroid lotion (e.g. betamethasone valerate 0.1% lotion bid)

**Stasis Dermatitis**

**Clinical Presentation**
- erythematous, scaly, pruritic plaques in lower legs, particularly the medial ankle
- brown hemosiderin deposition, woody fibrosis, atrophy blanche, and lipodermatosclerosis in late stages

**Pathophysiology**
- chronic venous insufficiency leads to venous stasis
- surrounding soft tissue inflammation and fibrosis results

**Investigations**
- Doppler and colour-coded Duplex sonography if suspicious for DVT
- culture for MRSA if there is crusting

**Management**
- compression stockings
- rest and elevate legs (above the level of the heart)
- moisturizer to treat xerosis
- mid-high potency topical corticosteroids to control inflammation

**Complications**
- ulceration (common at medial malleolus), secondary bacterial infections

**Lichen Simplex Chronicus**

**Clinical Presentation**
- well-defined plaque(s) of lichenified skin with decreased skin markings + excoriations
- common sites: neck, scalp, lower extremeties, urogenital area
- often seen in patients with atopy

**Pathophysiology**
- skin hyperexcitable to itch, continued rubbing/scratching of skin results
- eventually lichenification occurs

**Investigations**
- if patient has generalized pruritus, rule out systemic cause: CBC with differential count, transaminases, renal and thyroid function tests
- CXR if lymphoma suspected

**Management**
- antipruritics (e.g. antihistamines, topical or intralesional glucocorticoids, Unna boot)
Lichen Planus

Clinical Presentation
- acute or chronic inflammation of mucous membranes or skin, especially on flexural surfaces
- morphology: pruritic, well-demarcated, violaceous, polygonal, flat-topped papules
- common sites: wrists, ankles, mucous membranes in 60% (mouth, vulva, glans), nails, scalp
- distribution: symmetrical and bilateral
- Wickham's striae: reticulate white-grey lines over surface; pathognomonic but may not be present
- mucous membrane lesions: lacy, whitish reticular network, milky-white plaques/papules; increased risk of SCC in erosions and ulcers
- nails: longitudinal ridging; dystrophic; pterygium formation
- scalp: scarring alopecia with perifollicular hyperkeratosis
- spontaneously resolves but may last for weeks, months or years (mouth and skin lesions)
- rarely associated with hepatitis C
- Koebner phenomenon

Pathophysiology
- autoimmune, antigen unknown
- lymphocyte activation leads to keratinocyte apoptosis

Epidemiology
- 1%
- 30-60 yr old, F>M

Investigations
- biopsy
- hepatitis C serology if patient has risk factors

Management
- topical or intralesional corticosteroids
- short courses of oral prednisone (rarely)
- phototherapy for generalized or resistant cases
- oral retinoids for erosive lichen planus in mouth
- systemic immunosuppressants (e.g. azathioprine, methotrexate, cyclosporine)

The 6 Ps of Lichen Planus
- Purple
- Pruritic
- Polygonal
- Peripheral
- Papules
- Penis (i.e. mucosa)

Pityriasis Rosea

Clinical Presentation
- acute, self-limiting eruption characterized by red, oval plaques/patches with central scale that does not extend to edge of lesion
- long axis of lesions follows skin tension lines (i.e. Langer's Lines) parallel to ribs producing “Christmas tree” pattern on back
- varied degree of pruritus
- most start with a "herald" patch which precedes other lesions by 1-2 wk
- common sites: trunk, proximal aspects of arms and legs

Etiology
- suspected HHV-7 or HHV-6 reactivation

Investigations
- none required

Management
- none required; clears spontaneously in 6-12 wk
- symptomatic: topical glucocorticoids if pruritic
Psoriasis

Classification
1. plaque psoriasis
2. guttate psoriasis
3. erythrodermic psoriasis
4. pustular psoriasis
5. inverse psoriasis

Pathophysiology
- not fully understood, genetic and immunologic factors
- shortened keratinocyte cell cycle leads to Th1- and Th17-mediated inflammatory response

Epidemiology
- 1.5-2%, M>F
- all ages: peaks of onset: 20-30 and 50-60
- polygenic inheritance: 8% with 1 affected parent, 41% with both parents affected
- risk factors: smoking, obesity, alcohol, drugs, infections

Differential Diagnosis
- AD, mycosis fungoides (cutaneous T-cell lymphoma), seborrheic dermatitis, tinea, nummular dermatitis, lichen planus

Investigations
- biopsy (if atypical presentation, rarely needed)

1. PLATEAU PSORIASIS

Clinical Presentation
- chronic and recurrent disease characterized by well-circumscribed erythematous papules/plaques with silvery-white scales
- often worse in winter (lack of sun and humidity)
- Auspitz sign: bleeds from minute points when scale is removed
- common sites: scalp, extensor surfaces of elbows and knees, trunk (especially buttocks), nails, pressure areas

Management
- principles of management depends on severity of disease, as defined by BSA affected or less commonly Psoriasis Area and Severity Index (PASI)
  - mild (<5% BSA)
    - topical steroids, topical vitamin D3 analogues, or a combinations of the two are first line
    - topical retinoid ± topical steroid combination, anthralin, and tar are also effective but tend to have more side effects than first line therapies
    - emollients potentiate the effect of topical therapies
    - phototherapy or systemic treatment may be necessary if the lesions are scattered or if it involves sites that are difficult to treat such as palms, soles, scalp, genitals
  - moderate (5-10% BSA) to severe (>10% BSA)
    - goal of treatment is to attain symptom control that is adequate from patient’s perspective
    - phototherapy if accessible
    - systemic or biological therapy based on patient’s treatment history and comorbidities
    - topical steroid ± topical vitamin D3 analogue as adjunct therapy

PSORIASIS: Presentation and Pathophysiology
- Pink papules/Plaques/Point bleeding (Auspitz sign)/Physical injury (Koebner phenomenon)
- Silver scale/Sharp margins
- Nail findings: pitting/onycholysis/Oil spots/subungual hyperkeratosis/red lunula/
- Itching (sometimes)
- Immunologic with Th 1 and Th 17 helper cells being actively involved in the pathogenesis

PSORIASIS: Triggers
- Physical trauma (Koebner phenomenon)
- Infections (acute streptococcal infection precipitates guttate psoriasis)
- Stress (can be a major factor in flares)
- Drugs (rebound from stopping systemic glucocorticoids, lithium, antimalarial drugs, interferon)
- Smoking and heavy alcohol consumption

Mechanism of Biologics
- "-mab" = monoclonal antibody
- "-cept" = receptor

Topical Treatments for Chronic Plaque Psoriasis

Cochrane DB Syr Rev 2009;2:CD005028

Study: Systematic review of randomised trials comparing treatments against placebo or against vitamin D.

Patients: 21,448 patients with chronic plaque psoriasis

Intervention: Corticosteroids, dithranol, tazarotene, salicylic acid, methotrexate, macrolactams, vitamin D, and vitamin D + corticosteroids.

Results: Corticosteroids, vitamin D, dithranol, and tazarotene performed better than placebo alone. A combination of corticosteroids and vitamin D were better than either vitamin D or corticosteroids alone.

Calcipotriol is a Vitamin D Derivative

Dovobet® = calcipotriene combined with betamethasone dipropionate and is considered to be one of the most potent topical psoriatic therapies

</table>

*Can also be used to treat psoriatic arthritis

- biologics under study for treatment of psoriasis: secukinumab, brodalumab, ixekizumab, tildrakizumab, guselkumab

2. GUTTATE PSORIASIS (“DROP-LIKE”)

Clinical Presentation
- discrete, scattered salmon-pink small scaling papules
- sites: diffuse, usually on trunk and legs, sparing palms and soles
- often antecedent streptococcal pharyngitis

Management
- UVB phototherapy, sunlight, lubricants
- penicillin V or erythromycin if Group A β-hemolytic Streptococcus on throat culture

3. ERYTHRODERMIC PSORIASIS

Clinical Presentation
- generalized erythema (> 90% of body surface area) with fine desquamative scale on surface
- associated signs and symptoms: arthralgia, pruritus, dehydration, electrolyte imbalance
- aggravating factors: lithium, β-blockers, NSAIDs, antimalarials, phototoxic reaction, infection

Management
- IV fluids, monitor fluids and electrolytes, may require hospitalization
- treat underlying aggravating condition, sun avoidance
- cyclosporine, acitretin, UV, biologics

4. PUSTULAR PSORIASIS

Clinical Presentation
- sudden onset of erythematous macules and papules which evolve rapidly into pustules, can be painful
- may be generalized or localized to palms/soles
- patient usually has a history of psoriasis; may occur with sudden withdrawal from steroid therapy
5. INVERSE PSORIASIS

Clinical Presentation
• erythematous plaques on flexural surfaces such as axillae, inframammary folds, gluteal fold, inguinal folds
• lesions may be macerated

Management
• low potency topical corticosteroids
• topical vitamin D derivatives such as calcipotriene or calcitriol
• topical calcineurin inhibitors such as tacrolimus or pimecrolimus

6. PSORIATIC ARTHRITIS

• 5-30% of patients with psoriasis can also be suffering from psoriatic arthritis
• psoriatic patients with nail or scalp involvement are at a higher risk for developing psoriatic arthritis
• see Rheumatology, RH23

Vesiculobullous Diseases

Bullous Pemphigoid

Clinical Presentation
• chronic autoimmune bullous eruption characterized by pruritic, tense, subepidermal bullae on an erythematous or normal skin base
• can present as urticarial plaques without bullae
• common sites: flexor aspect of forearms, axillae, medial thighs, groin, abdomen, mouth in 33%

Pathophysiology
• IgG produced against dermal-epidermal basement membrane proteins (hemidesmosomes) leads to subepidermal bullae

Epidemiology
• mean age of onset: 60-80 yr old, F=M

Investigations
• immunofluorescence shows linear deposition of IgG and C3 along the basement membrane
• anti-basement membrane antibody (IgG) (pemphigoid antibody detectable in serum)

Prognosis
• heals without scarring, usually chronic
• rarely fatal

Management
• prednisone 0.5-1 mg/kg/day until clear, then taper ± steroid-sparing agents (e.g. azathioprine, methotrexate)
• topical potent steroids (clobetasol) may be as effective as systemic steroids in limited disease
• tetracycline ± nicotinamide is effective for some cases
• immunosuppressants such as azathioprine, mycophenolate mofetil, cyclosporine
• IVIg and plasmapheresis for refractory cases

Pemphigus Vulgaris

Clinical Presentation
• autoimmune blistering disease characterized by flaccid, non-pruritic intraepidermal bullae/vesicles on an erythematous or normal skin base
• may present with erosions and secondary bacterial infection
• sites: mouth (90%), scalp, face, chest, axillae, groin, umbilicus
• Nikolsky’s sign: rubbing pressure on skin to cause bulla formation
• Asboe-Hansen sign: pressure applied to bulla causes it to extend laterally

Pathophysiology
• IgG against epidermal desmoglein-1 and -3 leads to loss of intercellular adhesion in the epidermis
Epidemiology
• 40-60 yr old, M=F, higher prevalence in Jewish, Mediterranean, Asian populations
• paraneoplastic pemphigus may be associated with thymoma, myasthenia gravis, malignancy, and use of D-penicillamine

Investigations
• immunofluorescence: shows IgG and C3 deposition intraepidermally
• circulating serum anti-desmoglein IgG antibodies

Prognosis
• lesions heal with hyperpigmentation but do not scar
• may be fatal unless treated with immunosuppressive agents

Management
• prednisone 1-2 mg/kg until no new blisters, then 1-1.5 mg/kg until clear, then taper ± steroid-sparing agents (e.g. azathioprine, methotrexate, gold, cyclophosphamide, cyclosporine, IVlg, mycophenolate mofetil, rituximab)

Dermatitis Herpetiformis

Clinical Presentation
• grouped papules/vesicles/urticarial wheals on an erythematous base, associated with intense pruritus, burning, stinging, excoriations
• lesions grouped, bilaterally symmetrical
• common sites: extensor surfaces of elbows/knees, sacrum, buttocks, scalp

Pathophysiology
• transglutaminase IgA deposits in the skin alone or in immune complexes leading to eosinophil and neutrophil infiltration
• 90% have HLA B8, DR3, DQWZ
• 90-100% associated with an often subclinical gluten-sensitive enteropathy (i.e. celiac disease)
• 30% have thyroid disease; increased risk of intestinal lymphoma in untreated comorbid celiac disease; iron/folate deficiency is common

Epidemiology
• 20-60 yr old, M:F = 2:1

Investigations
• biopsy
• immunofluorescence shows IgA deposits in perilesional skin

Management
• dapsone (sulfapyridine if contraindicated or poorly tolerated)
• gluten-free diet for life – this can reduce risk of lymphoma

Porphyria Cutanea Tarda

Clinical Presentation
• skin fragility followed by formation of tense vesicles/bullae and erosions on photoexposed skin
• gradual healing to scars, milia
• periorbital violaceous discoloration, diffuse hypermelanosis, facial hypertrichosis
• common sites: light-exposed areas subjected to trauma, dorsum of hands and feet, nose, and upper trunk

Pathophysiology
• uroporphyrinogen decarboxylase deficiency leads to excess heme precursors
• can be associated with hemochromatosis, alcohol abuse, DM, drugs (estrogen therapy, NSAIDs), HIV, hepatitis C, increased iron indices

Epidemiology
• 30-40 yr old, M>F

Investigations
• urine + 5% HCl shows orange-red fluorescence under Wood's lamp (UV rays)
• 24 h urine for uroporphyrins (elevated)
• stool contains elevated coproporphyrins
• immunofluorescence shows IgE at dermal-epidermal junctions

Management
• discontinue aggravating substances (alcohol, estrogen therapy)
• phlebotomy to decrease body iron load
• low dose hydroxychloroquine
Drug Eruptions

Exanthematous

EXANTHEMATOUS DRUG REACTION

Clinical Presentation
• morphology: erythematous macules and papules ± scale
• spread: symmetrical, trunk to extremities
• time course: 7-14 d after drug initiation, fades 7-14 d after withdrawal

Epidemiology
• most common cutaneous drug reaction; increased in presence of infections
• common causative agents: penicillin, sulfonamides, phenytoin

Management
• weigh risks and benefits of drug discontinuation
• antihistamines, emollients, topical steroids

DRUG INDUCED HYPERSENSITIVITY SYNDROME (DIHS) / DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS)

Clinical Presentation
• morphology: morbilliform rash involving face, trunk, arms; can have facial edema
• systemic features: fever, malaise, cervical lymphadenopathy, internal organ involvement (e.g. hepatitis, arthralgia, nephritis, pneumonitis, lymphadenopathy, hematologic abnormalities, thyroid abnormalities)
• spread: starts with face or periorbitally and spreads caudally; no mucosal involvement
• time course: 1-6 weeks after first exposure to drug, persists weeks after withdrawal of drug

Epidemiology
• rare: incidence varies considerably depending on drug
• common causative agents: anticonvulsants (e.g. phenytoin, phenobarbital, carbamazepine, lamotrigine), sulfonamides, and allopurinol
• 10% mortality if severe, undiagnosed, and untreated

Management
• discontinue offending drug ± prednisone 0.5mg/kg per day, consider cyclosporine in severe cases
• may progress to generalized exfoliative dermatitis/erythroderma if drug is not discontinued

Urticarial

DRUG INDUCED URTICARIA AND ANGIOEDEMA

Clinical Presentation
• morphology: wheals lasting <24hrs, angioedema (face and mucous membranes)
• systemic features: may be associated with systemic anaphylaxis (bronchospasm, laryngeal edema, shock)
• time course: hours to days after exposure depending on the mechanism

Epidemiology
• second most common cutaneous drug reaction
• common causative agents: penicillins, ACEI, analgesics/anti-inflammatories, radiographic contrast media

Management
• discontinue offending drug, antihistamines, steroids, epinephrine if anaphylactic

Diagnosis of a Drug Reaction
Classification by Naranjo et. al has 4 criteria:
1. Temporal relationship between drug exposure and reaction
2. Recognized response to suspected drug
3. Improvement after drug withdrawal
4. Recurrence of reaction on re-challenge with the drug

Definite drug reaction requires all 4 criteria to be met
Probable drug reaction requires #1-3 to be met
Possible drug reaction requires only #1
SERUM SICKNESS-LIKE REACTION

Clinical Presentation
• morphology: symmetrical cutaneous eruption (usually urticarial)
• systemic features: malaise, low grade fever, althralgia, lymphadenopathy
• time course: appears 1-3 wks after drug initiation, resolve 2-3 wks after withdrawal

Epidemiology
• more prevalent in kids 0.02-0.2%
• common causative agents: cefaclor in kids; buproprion in adults

Management
• discontinue offending drug ± topical/oral corticosteroids

Pustular

ACUTE GENERALIZED EXANTHEMATOUS PUSTULOSIS (AGEP)

Clinical Presentation
• morphology: erythematous edema and sterile pustules prominent in intertriginous areas
• systemic features: high fever, leukocytosis with neutrophilia
• spread: starts in face and intertriginous areas and spread to trunk and extremities
• time course: appears 1 wk after drug initiation, resolve 2 wks after withdrawal

Epidemiology
• rare: 1-5/million
• common causative agents: aminopenicillins, cephalosporins, clindamycin, calcium channel blockers

Management
• discontinue offending drug and systemic corticosteroids

Bullous

STEVEN-JOHNSON SYNDROME (SJS)/TOXIC EPIDERMAL NECROLYSIS (TEN)

Clinical Presentation
• morphology: prodromal rash (morbilliform/targetoid lesions ± purpura, or diffuse erythema), confluence of flaccid blisters, positive Nikolsky sign (epidermal detachment with shear stress), full thickness epidermal loss;
• classification: BSA with epidermal detachment: <10% in SJS, 10-30% in SJS/TEN overlap, and >30% in TEN
• spread: face and extremities; may generalize; scalp, palms, soles relatively spared; erosion of mucous membranes (lips, oral mucosa, conjunctiva, GU mucosa)
• systemic features: fever (higher in TEN), cytopenias, renal tubular necrosis/AKI, tracheal erosion, infection, contractures, corneal scarring, phimosis, vaginal synchieae
• time course: appears 1-3 wk after drug initiation; progression <4days; epidermal regrowth in 3wk

Epidemiology
• SJS: 1.2-6/million; TEN: 0.4-1.2/million
• risk factors: SLE, HIV/AIDS, HLA-B1502 (associated with carbamazepine), HLA-B5801 (associated with allopurinol)
• common causative agents: drugs (allopurinol, anti-epileptics, sulfonamides, NSAIDs, cephalosporins) responsible in 50% of SJS and 80% of TEN; viral or mycoplasma infections;
• prognosis: 5% mortality in SJS, 30% in TEN due to fluid loss & infection

Differential Diagnosis
• Scarlet fever, phototoxic eruption, GVHD, SSSS, exfoliative dermatitis, AGEP, paraneoplastic pemphigus

Management
• discontinue offending drug
• admit to intermediate/intensive care/burn unit
• supportive care: IV fluids, electrolyte replacement, nutritional support, pain control, wound care, sterile handling, monitor for and treat infection
• IVIG or cyclosporine

SCORTEN Score for TEN Prognosis

One point for each of: age ≥40, malignancy, body surface area detached ≥10%, tachycardia ≥120 bpm, serum urea >10 mmol/L, serum glucose >14 mmol/L, serum bicarbonate <20 mmol/L

Used to determine appropriate clinical setting: score 0-1 can be treated in non-specialized wards; score ≥2 should be transferred to intensive care or burn unit

Score at admission is predictive of survival: 94% for 0-1, 87% for 2, 53% for 3, 25% for 4, and 17% for ≥5
Other

FIXED DRUG ERUPTION

Clinical Presentation
- morphology: sharply demarcated erythematous oval patches on the skin or mucous membranes
- spread: commonly face, mucosa, genitalia, acral; recurs in same location upon subsequent exposure to the drug (fixed location)

Epidemiology
- common causative agents: antimicrobials (tetracycline, sulfonamides), anti-inflammatory, psychoactive agents (barbiturates), phenolphthalein

Management
- discontinue offending drug ± prednisone 1mg/kg/d x 2 wk for generalized lesions ± potent topical corticosteroids for non-eroded lesions or antimicrobial ointment for eroded lesions

PHOTOSENSITIVITY REACTION

Clinical Presentation
- phototoxic reaction: “exaggerated sunburn” (erythema, edema, vesicles, bullae) confined to sun-exposed areas
- photoallergic reaction: pruritic eczematous eruption with papules, vesicles, scaling, and crusting that may spread to areas not exposed to light

Pathophysiology
- phototoxic reaction: direct tissue injury
- photoallergic reaction: type IV delayed hypersensitivity

Epidemiology
- common causative agents: chlorpromazine, doxycycline, thiazide diuretics, procainamide

Management
- sun protection ± topical/oral corticosteroids

Heritable Disorders

Ichthyosis Vulgaris

Clinical Presentation
- xerosis with fine scaling as well as large adherent scales (“fish-scales”)
- affects arms, legs, palms, soles, back, forehead, and cheeks; spares flexural creases
- improves in summer, with humidity, and as the child grows into adulthood

Pathophysiology
- genetic deficiency in filaggrin protein leads to abnormal retention of keratinocytes (hyperkeratosis)
- scaling without inflammation

Epidemiology
- 1:300 incidence
- autosomal dominant inheritance
- associated with AD and keratosis pilaris

Investigations
- electron microscopy: keratohyalin granules

Management
- immersion in bath and oils followed by an emollient cream, humectant cream, or creams/oil containing urea or α- or β-hydroxy acids
- intermittent systemic retinoids for severe cases
Neurofibromatosis (Type I; von Recklinghausen’s Disease)

Clinical Presentation
- diagnostic criteria includes 2 or more of the following
  1. more than 5 café-au-lait patches >1.5 cm in an adult or more than 5 café-au-lait macules >0.5 cm in a child under 5 yr
  2. axillary or inguinal freckling
  3. iris hamartomas (Lisch nodules)
  4. optic gliomas
  5. neurofibromas
  6. distinctive bony lesion (sphenoid wing dysplasia or thinning of long bone cortex)
  7. first degree relative with neurofibromatosis type 1
- associated with pheochromocytoma, astrocytoma, bilateral acoustic neuromas, bone cysts, scoliosis, precocious puberty, developmental delay, and renal artery stenosis
- skin lesions less prominent in neurofibromatosis Type II (see Pediatrics, P86)

Pathophysiology
- autosomal dominant disorder with excessive and abnormal proliferation of neural crest elements (Schwann cells, melanocytes), high incidence of spontaneous mutation
- linked to absence of neurofibromin (a tumour suppressor gene)

Epidemiology
- incidence 1:3,000

Investigations
- Wood's lamp examination to detect café-au-lait macules in patients with pale skin

Management
- refer to orthopedics, ophthalmology, plastics, and psychology for relevant management
- follow-up annually for brain tumours such as astrocytoma
- excise suspicious or painful lesions
- see Pediatrics, P86

Vitiligo

Clinical Presentation
- primary pigmentary disorder characterized by depigmentation
- acquired destruction of melanocytes characterized by sharply margined white patches
- associated with streaks of depigmented hair, chorioretinitis
- sites: extensor surfaces and periorificial areas (mouth, eyes, anus, genitalia)
- Koebner phenomenon, may be precipitated by trauma

Pathophysiology
- acquired autoimmune destruction of melanocytes

Epidemiology
- 1% incidence, polygenic
- 30% with positive family history

Investigations
- rule out associated autoimmune diseases: thyroid disease, pernicious anemia, Addison’s disease, Type I DM
- Wood's lamp to detect lesions: illuminates UV light onto skin to detect amelanosis (porcelain white discolouration)

Management
- sun avoidance and protection
- topical calcineurin inhibitor (e.g. tacrolimus, pimecrolimus) or topical corticosteroids
- PUVA or Narrow band UVB
- make-up
- “bleaching” normal pigmented areas (i.e. monobenzyl ether of hydroquinone 20%) if widespread loss of pigmentation

Interventions for Vitiligo
Cochrane DB Syst Rev 2010;1:CD003263
Study: Systematic review of randomized controlled trials.
Patients: 3,139 participants with vitiligo.
Intervention: Topical treatments, light therapies, oral treatments, surgical methods, and psychological therapies
Outcome: >75% repigmentation, adverse effects
Results: Moderate evidence exists for the use of topical corticosteroids to induce repigmentation but, adverse effects are observed with long-term use. Topical use of non-steroidal immunomodulators (e.g. tacrolimus), especially in combination with light therapies, has also been shown to induce repigmentation, but long-term use may theoretically increase the risk for skin cancer. In general, combination therapy including some form of light therapy had the most significant improvement. Sustained repigmentation (>2 yr) has not been reported and thus results should be treated with caution.
Bacterial Infections

EPIDERMIS

IMPETIGO

Clinical Presentation
- acute purulent infection which appears vesicular; progresses to golden yellow “honey-crusted” lesions surrounded by erythema
- can present with bullae
- common sites: face, arms, legs, and buttocks

Etiology
- GAS, S. aureus, or both

Epidemiology
- preschool and young adults living in crowded conditions, poor hygiene, neglected minor trauma

Differential Diagnosis
- infected eczema, HSV, VZV

Investigations
- Gram stain and culture of lesion fluid or biopsy

Management
- remove crusts, use saline compresses, and topical antiseptic soaks bid
- topical antibacterials such as 2% mupirocin or fusidic acid (Canada only) tid; continue for 7-10 d after resolution
- systemic antibiotics such as cloxacillin or cephalaxin for 7-10 d

Figure 7. Layers of skin affected by bacterial infections

Location Matters!
- Impetigo → just below stratum corneum
- Erysipelas → epidermis and upper dermis only
- Cellulitis → primarily lower dermis and subcutis (primarily not raised, and demarcation less distinct than erysipelas)
- Necrotizing fasciitis → deep fascia and muscle
Table 16. Comparison of Erysipelas and Cellulitis

</table>

**Dermatophytoses**

**Clinical Presentation**
- infection of skin, hair, and nails caused by dermatophytes (fungi that live within the epidermal keratin or hair follicle and do not penetrate into deeper structures)

**Pathophysiology**
- digestion of keratin by dermatophytes results in scaly skin, broken hairs, crumbling nails/onycholysis

**Etiology**
- *Trichophyton, Microsporum, Epidermophyton* species (*Pityrosporum* is a superficial yeast and not a dermatophyte)

**Investigations**
- skin scrapings, hair, and/or nail clippings analyzed with potassium hydroxide (KOH) prep to look for hyphae and mycelia
### Management
- Topicals as first line agents for tinea corporis/cruris and tinea pedis (interdigital type): clotrimazole, or terbinafine or ciclopirox olamine cream applied bid
- Oral therapy is indicated for onychomycosis or tinea capitis: terbinafine (Lamisil® – liver toxicity, CYP2D6 inhibitor) or itraconazole (Sporanox® – CYP3A4 inhibitor, liver toxicity)

### Table 18. Different Manifestations of Dermatophyte Infection

### Parasitic Infections

#### SCABIES

**Clinical Presentation**
- Characterized by superficial burrows, intense pruritus (especially nocturnal), and secondary infection
- Primary lesion: superficial linear burrows; inflammatory papules and nodules in the axilla and groin
- Secondary lesion: small urticarial crusted papules, eczematous plaques, excoriations
- Common sites: axillae, groin, buttocks, hands/feet (especially web spaces), sparing of head and neck (except in infants)
**Pathophysiology**
- scabies mite remains alive 2-3 d on clothing/sheets
- incubation of 1 mo, then pruritus begins
- re-infection followed by hypersensitivity in 24 h

**Etiology**
- *Sarcoptes scabiei* (a mite)
- risk factors: sexual promiscuity, crowding, poverty, nosocomial, immunocompromised

**Differential Diagnosis**
- asteatotic eczema, dermatitis herpetiformis, lichen simplex chronicus (neurodermatitis)

**Investigations**
- microscopic examination of root and content of burrow and mineral oil mount for mite, eggs, feces
- skin biopsy may sometimes show scabies mite

**Management**
- bathe, then apply permethrin 5% cream (i.e. Nix®) from neck down to soles of feet (must be left on for 8-14 h and requires second treatment 7 d after first treatment)
- change underwear and linens; wash twice with detergent in hot water cycle then machine dry
- treat family and close contacts
- pruritus may persist for 2-3 wk after effective treatment due to prolonged hypersensitivity reaction
- mid potency topical steroids and antihistamines for symptom management

**LICE (PEDICULOSIS)**

**Clinical Presentation**
- intensely pruritic red excoriations, morbilliform rash, caused by louse (a parasite)
- scalp lice: nits (i.e. louse eggs) on hairs; red, excoriated skin with secondary bacterial infection, lymphadenopathy
- pubic lice: nits on hairs; excoriations
- body lice: nits and lice in seams of clothing; excoriations and secondary infection mainly on shoulders, belt-line and buttocks

**Etiology**
- *Phthirius pubis* (pubic), *Pediculus humanus capitis* (scalp), *Pediculus humanus humanus* (body): attaches to body hair and feeds
- can transmit infectious agents such as *Bartonella quintana* and *Rickettsia prowazekii*

**Differential Diagnosis**
- bacterial infection of scalp, seborrheic dermatitis

**Diagnosis**
- lice visible on inspection of affected area or clothing seams

**Management**
- permethrin 1% (Nix® cream rinse) (ovicidal) or permethrin 1% (RC & Cor®, Kwella-P® shampoo)
- comb hair with fine-toothed comb using dilute vinegar solution to remove nits
- repeat in 7 d after first treatment
- shave hair if feasible, change clothing and linens; wash with detergent in hot water cycle then machine dry

**BED BUGS (HEMIPTERA)**

**Clinical Presentation**
- burning wheals, turning to firm papules, often in groups of three – “breakfast, lunch and dinner” – in areas with easy access (face, neck, arms, legs, hands)

**Etiology**
- caused by *Cimex lectularius*, a small insect that feeds mainly at night (hide in crevices in walls and furniture during the day)

**Differential Diagnosis**
- dermatitis herpetiformis, drug eruptions, ecthyma, other insect bites, scabies

**Investigations**
- none required, but lesional biopsy can confirm insect bite reaction

**Management**
- professional fumigation
- topical steroids and oral H1-antagonists for symptomatic relief
- definitive treatment is removal of clutter in home and application of insecticides to walls and furniture
**Viral Infections**

**HERPES SIMPLEX**

**Clinical Presentation**
- herpetiform (i.e. grouped) vesicles on an erythematous base on skin or mucous membranes
- transmitted via contact with erupted vesicles or via asymptomatic viral shedding
- **primary**
  - children and young adults
  - usually asymptomatic; may have high fever, regional lymphadenopathy, malaise
  - followed by antibody formation and latency of virus in dorsal nerve root ganglion
- **secondary**
  - recurrent form seen in adults; much more common than primary
  - prodrome: tingling, pruritus, pain
  - triggers for recurrence: fever, excess sun exposure, physical trauma, menstruation, emotional stress, URTI
- **complications**: dendritic corneal ulcer, EM, herpes simplex encephalitis (infants at risk), HSV infection on AD causing Kaposi's varicelliform eruption (eczema herpeticum)
- two biologically and immunologically different subtypes: HSV-1 and HSV-2
  - HSV-1
    - typically “cold sores” (grouped vesicles at the mucocutaneous junction which quickly burst)
    - recurrent on face, lips and hard palate, but NOT on soft, non-keratinized mucous membranes (unlike aphthous ulcers)
  - HSV-2
    - usually sexually transmitted; incubation 2-20 d
    - gingivostomatitis: entire buccal mucosa involved with erythema and edema of gingiva
    - vulvovaginitis: edematous, erythematous, extremely tender, profuse vaginal discharge
    - urethritis: watery discharge in males
    - recurrent on vulva, vagina, penis for 5-7 d
- differential diagnosis of genital ulcers: Candida balanitis, chancroid, syphilitic chancres

**Investigations**
- Tzanck smear with Giemsa stain shows multinucleated giant epithelial cells
- viral culture, electron microscopy, and direct fluorescence antibody test of specimen taken from the base of a relatively new lesion
- serologic testing for antibody for current or past infection if necessary

**Management**
- HSV-1
  - treat during prodrome to prevent vesicle formation
  - topical antiviral (Zovirax®/Xerese®) cream, apply 5-6x/d x 4-7 d for facial/genital lesions
  - oral antivirals (e.g. acyclovir, famciclovir, valacyclovir) are far more effective and have an easier dosing schedule than topicals
- HSV-2
  - rupture vesicle with sterile needle if you wish to culture it
  - wet dressing with aluminum subacetate solution, Burow’s compression, or betadine solution
  - 1st episode: acyclovir 200 mg PO 5x/d x 10 d
  - maintenance: acyclovir 400 mg PO bid
  - famciclovir and valacyclovir may be substituted and have better enteric absorption and less frequent dosing
  - in case of herpes genitalis, look for and treat any other sexually-transmitted infections STIs
  - for active lesions in pregnancy, see Obstetrics, OB30

**HERPES ZOSTER (SHINGLES)**

**Clinical Presentation**
- unilateral dermatomal eruption occurring 3-5 d after pain and paresthesia of that dermatome
- vesicles, bullae, and pustules on an erythematous, edematous base
- lesions may become eroded/ulcerated and last days to weeks
- pain can be pre-herpetic, synchronous with rash, or post-herpetic
- severe post-herpetic neuralgia often occurs in elderly
- Hutchinson’s sign: Shingles on the tip of the nose signifies eye involvement. Shingles in this area involves the nasociliary branch of the ophthalmic branch of the trigeminal nerve, which is why it signals a high risk for ocular involvement
- distribution: thoracic (50%), trigeminal (10-20%), cervical (10-20%); disseminated in HIV

**Etiology**
- caused by reactivation of VZV
- risk factors: immunosuppression, old age, occasionally associated with hematologic malignancy

**Differential Diagnosis**
- before thoracic skin lesions occur, must consider other causes of chest pain
- contact dermatitis, localized bacterial infection, zosteriform HSV (more pathogenic for the eyes than VZV)
Investigations
• none required, but can do Tzanck test, direct fluorescence antibody test, or viral culture to rule out HSV

Management
• compress with normal saline, Burow’s, or betadine solution
• analgesics (NSAIDs, amitriptyline)
• famciclovir, valacyclovir, or acyclovir for 7 d; must initiate within 72 h to be of benefit
• gabapentin 300-600 mg PO tid for post-herpetic neuralgia

MOLLUSCUM CONTAGIOSUM

Clinical Presentation
• discrete dome-shaped and umbilicated pearly, white papules caused by DNA Pox virus (Molluscum contagiosum virus)
• common sites: eyelids, beard (likely spread by shaving), neck, axillae, trunk, perineum, buttocks

Etiology
• virus is spread via direct contact, auto-inoculation, sexual contact
• common in children and sexually active young adults (giant molluscum and severe cases can be seen in the setting of HIV)

Investigations
• none required, however can biopsy to confirm diagnosis

Management
• topical cantharidin (a vesicant)
• cryotherapy
• curettage
• topical retinoids
• Aldara® (imiquimod): immune modulator that produces a cytokine inflammation

WARTS (VERRUCA VULGARIS) (HUMAN PAPILLOMAVIRUS INFECTIONS)

Table 19. Different Manifestations of HPV Infection

<table>
<thead>
<tr>
<th>Definition and Clinical Features</th>
<th>Differential Diagnosis</th>
<th>Distribution</th>
<th>HPV Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Verruca Vulgaris (Common Warts)</td>
<td>Hyperkeratotic, elevated discrete epithelial growths with papillated surface caused by HPV Paring of surface reveals punctate, red-brown specs (thrombosed capillaries)</td>
<td>Molluscum contagiosum, seborheic keratosis</td>
<td>Located at trauma sites: fingers, hands, knees of children and teens</td>
</tr>
<tr>
<td>Verruca Plantaris (Plantar Warts) and Verruca Palmaris (Palmar Warts)</td>
<td>Hyperkeratotic, shiny, sharply marginated growths Paring of surface reveals red-brown specs (capillaries), interruption of epidermal ridges</td>
<td>May need to scrape (“pare”) lesions to differentiate wart from callus and corn</td>
<td>Located at pressure sites: metatarsal heads, heels, toes</td>
</tr>
<tr>
<td>Verruca Planae (Flat Warts)</td>
<td>Multiple discrete, skin coloured, flat topped papules grouped or in linear configuration Common in children</td>
<td>Syringoma, seborheic keratosis, molluscum contagiosum, lichen planus</td>
<td>Sites: face, dorsa of hands, shins, knees</td>
</tr>
<tr>
<td>Condyloma Acuminata (Genital Warts)</td>
<td>Skin-coloured pinhead papules to soft cauliflower like masses in clusters Often occurs in young adults, infants, children Can be asymptomatic, lasting months to years Highly contagious, transmitted sexually and non-sexually (e.g. Koebner phenomenon via scratching, shaving), and can spread without clinically apparent lesions Investigations: aceto whitening (subclinical lesions seen with 5% acetic acid x 5 min and hand lens) Complications: fairy-ring warts (satellite warts at periphery of treated area of original warts)</td>
<td>Condyloma lata (secondary syphilitic lesion, dark field strongly +ve), molluscum contagiosum</td>
<td>Sites: genitalia and perianal areas</td>
</tr>
</tbody>
</table>

Treatment for Warts
• first line therapies
  • salicylic acid preparations (patches, solutions, creams, ointments), cryotherapy, topical cantharone
• second line therapies
  • topical imiquimod, topical 5-fluorouracil, topical tretinoin, podophyllotoxin
• third line therapies
  • curettage, cautery, surgery for non plantar warts, CO2 laser, oral cimetidine (particularly children), intralesional bleomycin (plantar warts), trichloroacetic acid, diphenycrynone
• other viruses associated with skin changes, such as measles, roseola, fifth disease, etc.
• see Pediatrics, Pediatric Exanthems, P56
Yeast Infections

CANDIDIASIS

Etiology
• many species of Candida (70-80% of infections are from Candida albicans)
• opportunistic infection in those with predisposing factors (e.g. trauma, malnutrition, immunodeficiency)

Candidal Paronychia
• clinical presentation: painful red swellings of periungual skin
• management: topical agents not as effective; oral antifungals recommended

Candidal Intertrigo
• clinical presentation:
  • macerated/eroded erythematous patches that may be covered with papules and pustules, located in intertriginous areas often under breast, groin, or interdigitally
  • peripheral “satellite” pustules
  • starts as non-infectious maceration from heat, moisture, and friction
• predisposing factors: obesity, DM, systemic antibiotics, immunosuppression, malignancy
• management: keep area dry, terbinafine, ciclopirox olamine, ketoconazole/clotrimazole cream bid until rash clears

PITYRIASIS (TINEA) VERSICOLOR

Clinical Presentation
• asymptomatic superficial fungal infection with brown/white scaling macules
• affected skin darker than surrounding skin in winter, lighter in summer (does not tan)
• common sites: upper chest and back

Pathophysiology
• microbe produces azelaic acid → inflammatory reaction inhibiting melanin synthesis yielding variable pigmentation
• affinity for sebaceous glands; require fatty acids to survive

Etiology
• Pityrosporum ovale (Malassezia furfur)
• also associated with folliculitis and seborrheic dermatitis
• predisposing factors: summer, tropical climates, excessive sweating, Cushing’s syndrome, prolonged corticosteroid use

Investigations
• clinical diagnosis but can perform microscopic examination, KOH prep of scales for hyphae and spores

Management
• ketoconazole shampoo or cream daily
• topical terbinafine or ciclopirox olamine bid
• systemic fluconazole or itraconazole for 7 d if extensive

Sexually Transmitted Infections

SYPHILIS

Clinical Presentation
• characterized initially by a painless ulcer (chancre)
• following inoculation, systemic infection with secondary and tertiary stages

Etiology
• Treponema pallidum
• transmitted sexually, congenitally, or rarely by transfusion
**Table 20. Stages of Syphilis**

<table>
<thead>
<tr>
<th>Clinical Presentation</th>
<th>Investigations</th>
<th>Management</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Primary Syphilis</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Single red, indurated, painless chancre, that develops into painless ulcer with raised border and scanty serous exudate</td>
<td>CAN NOT be based on clinical presentation alone</td>
<td>Penicillin G, 2.4 million units IM, single dose</td>
</tr>
<tr>
<td>Chancre develops at site of inoculation after 3 wk of incubation and heals in 4-6 wk; chancre may also develop on lips or anus</td>
<td>VDRL negative – repeat weekly for 1 mo</td>
<td></td>
</tr>
<tr>
<td>Regional non-tender lymphadenopathy appears &lt; 1 wk after onset of chancre</td>
<td>Fluorescent treponemal antibody-syphilis (FTA-ABS) test has greater sensitivity and may detect disease earlier in course</td>
<td></td>
</tr>
<tr>
<td>DDx: chancroid (painful), HSV (multiple lesions)</td>
<td>Dark field examination – spirochete in chancre fluid or lymph node aspirate</td>
<td></td>
</tr>
<tr>
<td><strong>Secondary Syphilis</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Presents 2-6 mo after primary infection (patient may not recall presence of primary chancre)</td>
<td>VDRL positive</td>
<td>As for primary syphilis</td>
</tr>
<tr>
<td>Associated with generalized lymphadenopathy, splenomegaly, headache, chills, fever, arthralgias, myalgia, malaise, photophobia</td>
<td>FTA-ABS +ve; –ve after 1 yr following appearance of chancre</td>
<td></td>
</tr>
<tr>
<td>Lesions heal in 1-5 wk and may recur for 1 yr</td>
<td>Dark field +ve in all secondary</td>
<td></td>
</tr>
<tr>
<td>3 types of lesions:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>1. Macules and papules: flat top, scaling, non-pruritic, sharply defined, circular/annular rash (DDx: pityriasis rosea, tinea corporis, drug eruptions, lichen planus)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>2. Condyloma lata: wart-like moist papules around genital/perianal region</td>
<td></td>
<td></td>
</tr>
<tr>
<td>3. Mucous patches: macerated patches mainly found in oral mucosa</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Tertiary Syphilis</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Extremely rare</td>
<td>As in primary syphilis, VDRL can be falsely negative</td>
<td>Treatment: penicillin G, 2.4 million units IM weekly x 3 wk</td>
</tr>
<tr>
<td>3-7 yr after secondary</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Main skin lesion: ‘Gumma’ – a granulomatous non-tender nodule</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**GONOCOCCEMIA**

**Clinical Presentation**
- disseminated gonococcal infection
- hemorrhagic, tender, pustules on a purpuric/petechial background
- common sites: distal aspects of extremities
- associated with fever, arthritis, urethritis, proctitis, pharyngitis, and tenosynovitis
- neonatal conjunctivitis if infected via birth canal

**Etiology**
- *Neisseria gonorrhoeae*

**Investigations**
- requires high index of clinical suspicion plays because tests are often negative
- bacterial culture of blood, joint fluid, and skin lesions
- joint fluid cell count and Gram stain

**Management**
- notify Public Health authorities
- screen for other STIs
- cefixime 400 mg PO (drug of choice) or ceftriaxone 125 mg IM

**HSV**
- see *Viral Infections, D30*

**HPV**
- see *Viral Infections, D31*
Pre-Malignant Skin Conditions

Actinic Keratosis (Solar Keratosis)

Clinical Presentation
- ill-defined, scaly erythematous papules or plaques on a background of sun-damaged skin (solar heliosis)
- sandpaper-like, gritty sensation felt on palpation, often easier to appreciate on palpation rather than inspection
- sites: areas of sun exposure (face, ears, scalp if bald, neck, sun-exposed limbs)

Pathophysiology
- UV radiation damage to keratinocytes from repeated sun exposure (especially UVB)
- risk of transformation of AK to SCC (~1/1,000), but higher likelihood if AK is persistent

Epidemiology
- common with increasing age, outdoor occupation, M>F
- skin phototypes I-III, rare in darker skin as melanin is protective

Differential Diagnosis
- SCC in situ, superficial BCC, seborrheic keratosis, cutaneous lupus erythematosus

Investigations
- biopsy lesions that are refractory to treatment

Management
- destructive: cryotherapy, electrodesiccation, and curettage
- topical pharmacotherapy (mechanism: destruction of rapidly growing cells or immune system modulation)
  - topical 5-Fluorouracil cream (for 2-4 wk), Imiquimod 5% (2 times per wk for 16 wk), Imiquimod 3.75% (daily for 2 wk then none for 2 wk then daily for 2 wk), Ingenol Mebutate gel 0.015% (daily for 3 d on the head and neck), Ingenol mebutate 0.05% gel (daily for 2 d on the body)
- photodynamic therapy
- excision

Types of AK
- Erythematous: typical AK lesion
- Hypertrophic: thicker, rough papule/plaque
- Cutaneous horn: firm hyperkeratotic outgrowth
- Actinic cheilitis: confluent AKs on the lip
- Pigmented: flat, tan-brown, scaly plaque
- Spreading pigmented
- Proliferative
- Conjunctival: pinguecula, pterygium

Leukoplakia

Clinical Presentation
- a morphologic term describing homogenous or speckled white plaques with sharply demarcated borders
- sites: oropharynx, most often floor of the mouth, soft palate, and ventral/lateral surfaces of the tongue

Pathophysiology
- precancerous or premalignant condition
- oral form is strongly associated with tobacco use and alcohol consumption

Epidemiology
- 1-5% prevalence in adult population after 30 yr of age; peak at age 50
- M>F, fair-skinned
- most common oral mucosal premalignant lesion

Differential Diagnosis
- lichen planus, oral hairy leukoplakia

Investigations
- biopsy is mandatory because it is premalignant

Management
- low risk sites on buccal/labial mucosal or hard palate: eliminate carcinogenic habits, follow-up
- moderate/dysplastic lesions: excision, cryotherapy
Malignant Skin Tumours

Non-Melanoma Skin Cancers

BASAL CELL CARCINOMA

Subtypes
- noduloulcerative (typical)
  - skin-coloured papule/nodule with rolled, translucent (“pearly”) telangiectatic border, and depressed/eroded/ulcerated centre
- pigmented variant
  - flecks of pigment in translucent lesion with surface telangiectasia
- superficial variant
  - may mimic MM
- superfi
cial variant
  - flat, tan to red-brown plaque, often with scaly, pearly border and fine telangiectasia at margin
  - least aggressive subtype
- sclerosing (morpheaform) variant
  - flesh/yellowish-coloured, shiny papule/plaque with indistinct borders, indurated

Pathophysiology
- malignant proliferation of basal keratinocytes of the epidermis
- low grade cutaneous malignancy, locally aggressive (primarily tangential growth), rarely metastatic
- usually due to UVB light exposure, therefore >80% on face
- may also occur in previous scars, radiation, trauma, arsenic exposure, or genetic predisposition (Gorlin syndrome)

Epidemiology
- most common malignancy in humans
- 75% of all malignant skin tumours >40 yr, increased prevalence in the elderly
- M>F, skin phototypes I and II, chronic cumulative sun exposure

Differential Diagnosis
- benign: sebaceous hyperplasia, intradermal melanocytic nevus, dermatofibroma
- malignant: nodular MM, SCC

Management
- imiquimod 5% cream (Aldara”) or cryotherapy is indicated for superficial BCCs on the trunk
- shave excision + electrodessication and curettage for most types of BCCs, not including morpheaform
- Mohs surgery: microscopically controlled, minimally invasive, stepwise excision for lesions on the face or in areas that are difficult to reconstruct
- radiotherapy used in advanced cases of BCC where surgical intervention is not an option
- vismodegib is approved for metastatic BCC
- life-long follow-up
- 95% cure rate if lesion <2 cm in diameter or if treated early

SQUAMOUS CELL CARCINOMA

Clinical Presentation
- indurated erythematous nodule/plaque with surface scale/crust ± ulceration
- more rapid enlargement than BCC
- sites: face, ears, scalp, forearms, dorsum of hands

Pathophysiology
- malignant neoplasm of keratinocytes (primarily vertical growth)
- predisposing factors include: UV radiation, PUVA, ionizing radiation therapy/exposure, chemical carcinogens (such as arsenic, tar, and nitrogen mustards), HPV 16, 18, immunosuppression
- may occur in previous scar (SCC more commonly than BCC)

Epidemiology
- second most common type of cutaneous neoplasm
- primarily on sun-exposed skin in the elderly, M>F, skin phototypes I and II, chronic sun exposure
- in organ transplant recipients SCC is most common cutaneous malignancy, with increased mortality as compared to non-immunocompromised population
Differential Diagnosis
• benign: nummular eczema, psoriasis, irritated seborrheic keratosis
• malignant: keratoacanthoma, Bowen’s disease, BCC

Management
• surgical excision with primary closure, skin flaps or grafting
• Mohs surgery
• lifelong follow-up (more aggressive treatment than BCC)

Prognosis
• good prognostic factors: early treatment, negative margins, and small size of lesion
• SCCs that arise from AK metastasize less frequently (~1%) than other SCCs arising de novo in old burns (2-5% of cases)
• overall control is 75% over 5 yr, 5-10% metastasize

BOWEN’S DISEASE (SQUAMOUS CELL CARCINOMA IN SITU)
Clinical Presentation
• sharply demarcated erythematous plaque with scale and/or crusting
• often 1-3 cm in diameter and found on the skin and mucous membranes
• evolves to SCC in 10-20% of cutaneous lesions and >20% of mucosal lesions
Management
• same as for BCC
• biopsy required for diagnosis
• topical 5-fluorouracil (Efudex®) or imiquimod (Aldara®) used if extensive and as a tool to identify margins of poorly defined tumours
• cryosurgery
• shave excision with electrocautery and curettage

KERATOACANTHOMA
Clinical Presentation
• rapidly growing, firm, dome-shaped, erythematous or skin-coloured nodule with central keratin-filled crater, resembling an erupting volcano
• may spontaneously regress within a year, leaving a scar
• sites: sun-exposed skin
Pathophysiology
• epithelial neoplasm with atypical keratinocytes in epidermis
• low grade variant of SCC
Etiology
• HPV, UV radiation, chemical carcinogens (tar, mineral oil)
Epidemiology
• >50 yr, rare <20 yr
Differential Diagnosis
• treat as SCC until proven otherwise
• hypertrophic solar keratosis, verruca vulgaris
Management
• surgical excision or saucerization (shave biopsy) followed by electrocautery of the base, treated similarly to SCC

Malignant Melanoma
Clinical Presentation
• malignant characteristics of a mole: “ABCDE” mnemonic
• sites: skin, mucous membranes, eyes, CNS
Clinical Subtypes of Malignant Melanoma
• lentigo maligna
  • malignant melanoma in situ (normal and malignant melanocytes confined to the epidermis)
  • 2-6 cm, tan/brown/black uniformly flat macule or patch with irregular borders

Does this Patient have a Mole or Melanoma?
ABCD checklist
Asymmetry
Border (irregular and/or indistinct)
Colour (varied)
Diameter (increasing or >6 mm)
Enlargement, elevation, evolution (i.e. change in colour, size, or shape)
Sensitivity 92% (CI 82-96%)
Specificity 100% (CI 54-100%)
JAMA 1998;279:696-701
• lesion grows radially and produces complex colours
  • often seen in the elderly
  • 10% evolve to lentigo maligna melanoma
• lentigo maligna melanoma (15% of all melanomas)
  • malignant melanocytes invading into the dermis
  • associated with pre-existing solar lentigo, not pre-existing nevi
  • flat, brown, stain-like, gradually enlarging with loss of skin surface markings
  • with time, colour changes from uniform brown to dark brown with black and blue
  • found on all skin surfaces, especially those often exposed to sun, such as the face and hands
• superficial spreading melanoma (60-70% of all melanomas)
  • atypical melanocytes initially spread laterally in epidermis then invade the dermis
  • irregular, indurated, enlarging plaques with red/white/blue discolouration, focal papules or nodules
  • ulcerate and bleed with growth
• nodular melanoma (30% of all melanomas)
  • atypical melanocytes that initially grow vertically with little lateral spread
  • uniformly ulcerated, blue-black, and sharply delineated plaque or nodule
  • rapidly fatal
  • may be pink or have no colour at all, this is called an amelanotic melanoma
  • “EFG” Elevated, Firm, Growing
• acrolentiginous melanoma (5% of all melanomas)
  • ill-defined dark brown, blue-black macule
  • palmar, plantar, subungual skin
  • melanomas on mucous membranes have poor prognosis

Pathophysiology
• malignant neoplasm of pigment forming cells (melanocytes and nevus cells)

Epidemiology
• incidence 1/75 (Canada) 1/50 (US)
• risk factors: numerous moles, fair skin, red hair, positive personal/family history, large congenital nevi, familial dysplastic nevus syndrome, multiple dysplastic nevi
• most common sites: back (M), calves (F)
• worse prognosis if: male, on scalp, hands, feet, late lesion, no pre-existing nevus present

Differential Diagnosis
• benign: nevi, solar lentigo, seborrheic keratosis
• malignant: pigmented BCC

Management
• excisional biopsy preferable, otherwise incisional biopsy
• remove full depth of dermis and extend beyond edges of lesion only after histologic diagnosis
• beware of lesions that regress – tumour is usually deeper than anticipated
• high dose IFN for stage II (regional), chemotherapy (cis-platinum, BCG) and high dose IFN for stage III (distant) disease
• newer chemotherapeutic, gene therapies, and vaccines starting to be used in metastatic melanoma
• radiotherapy may be used as adjunctive treatment

a = no ulceration; b = ulceration

Other Cutaneous Cancers

CUTANEOUS T-CELL LYMPHOMA

Clinical Presentation
• Mycosis fungoides (limited superficial type)
  • characterized by erythematous patches/plaques/nodules/tumours, which may be pruritic and poikilodermic (atrophy, telangiectasia, hyperpigmentation)
  • common sites include: trunk, buttocks, proximal limbs
  • mildly symptomatic, usually excellent prognosis for early disease
Sézary syndrome (widespread systemic type)
- rare variant characterized by erythroderma, lymphadenopathy, WBC >20 x 10^9/L with Sézary cells
- associated with intense pruritus, alopecia, palmoplantar hyperkeratosis, and systemic symptoms (fatigue, fever)
- often fatal

Pathophysiology
- clonal proliferation of skin-homing CD4 T-cells

Epidemiology
- >50 yr old, M:F 2:1

Differential Diagnosis
- tinea corporis, nummular dermatitis, psoriasis, DLE, Bowen's disease

Investigations
- skin biopsy (histology, "lymphocyte antigen cell" markers, TcR gene arrangement)
- blood smear looking for Sézary cells or flow cytometry (e.g. CD4:CD8 >10 is Sézary)
- imaging (for systemic involvement)

Management
- Mycosis fungoides
  - depends on stage of disease
  - topical steroids and/or PUVA, narrow band (311-313 nm), UVB (NBUVB)
- Sézary syndrome
  - oral retinoids and IFN
  - extra-corporeal photophoresis
  - may need radiotherapy for total skin electron beam radiation
  - may maintain on UV therapy
  - other chemotherapy agents

Diseases of Hair Density

Hair Growth
- hair grows in a cyclic pattern that is defined in 3 stages
  1. growth stage = anagen phase
  2. transitional stage = catagen stage
  3. resting stage = telogen phase
- total duration of the growth stage reflects the type and location of hair: eyebrow, eyelash, and axillary hairs have a short growth stage in relation to the resting stage
- growth of the hair follicles is also based on the hormonal response to testosterone and DHT; this response is genetically controlled

Non-Scarring (Non-Cicatricial) Alopecia

ANDROGENETIC ALOPECIA

Clinical Presentation
- male- or female-pattern alopecia
- males: fronto-temporal areas progressing to vertex, entire scalp may be bald
- females: widening of central part, “Christmas tree” pattern

Pathophysiology
- action of testosterone on hair follicles

Epidemiology
- males: early 20s-30s
- females: 40s-50s

Management
- minoxidil (Rogaine®) solution or foam to reduce rate of loss/partial restoration
- spironolactone in women (anti-androgenic effects), cyproterone acetate (Diane-35®)
- finasteride (Propecia®) (5-a-reductase inhibitor) 1 mg/d in men
- hair transplant

DDx of Non-Scarring (Non-Cicatricial) Alopecia
- Autoimmune
  - Alopecia areata
- Endocrine
  - Hypothyroidism
  - Androgens
- Micronutrient deficiencies
  - Iron
  - Zinc
- Toxins
  - Heavy metals
  - Anticoagulants
  - Chemotherapy
  - Vitamin A
- Trauma to the hair follicle
  - Trichotillomania
  - ’Corn-row’ braiding
- Other
  - Syphilis
  - Severe illness
  - Childbirth
PHYSICAL
• trichotillomania: impulse-control disorder characterized by compulsive hair pulling with irregular patches of hair loss, and with remaining hairs broken at varying lengths
• traumatic (e.g. tight “corn-row” braiding of hair, wearing tight pony tails, tight tying of turbans)

TELOGEN EFFLUVIUM
Clinical Presentation
• uniform decrease in hair density secondary to hairs leaving the growth (anagen) stage and entering the resting (telogen) stage of the cycle
Pathophysiology
• variety of precipitating factors
• hair loss typically occurs 2-4 mo after exposure to precipitant
• regrowth occurs within a few months but may not be complete

ANAGEN EFFLUVIUM
Clinical Presentation
• hair loss due to insult to hair follicle impairing its mitotic activity (growth stage)
Pathophysiology
• precipitated by chemotherapeutic agents (most common), other meds (bismuth, levodopa, colchicine, cyclosporine), exposure to chemicals (thallium, boron, arsenic)
• dose-dependent effect
• hair loss 7-14 d after single pulse of chemotherapy; most clinically apparent after 1-2 mo
• reversible effect; follicles resume normal mitotic activity few weeks after agent stopped

ALOPECIA AREATA
Clinical Presentation
• autoimmune disorder characterized by patches of complete hair loss often localized to scalp but can affect eyebrows, beard, eyelashes, etc.
• may be associated with dystrophic nail changes – fine stippling, pitting
• “exclamation mark” pattern (hairs fractured and have tapered shafts, i.e. looks like “!”)
• may be associated with pernicious anemia, vitiligo, thyroid disease, Addison’s disease
• spontaneous regrowth may occur within months of first attack (worse prognosis if young at age of onset and extensive loss)
• frequent recurrence often precipitated by emotional distress
Management
• generally unsatisfactory
• intralesional triamcinolone acetonide (corticosteroids) can be used for isolated patches
• UV or PUVA therapy
• immunomodulatory (diphencyprone)

Non-scarring alopecia: intact hair follicles on exam → biopsy not required (but may be helpful)
Scarring alopecia: absent hair follicles on exam → biopsy required

ALOPECIA AREATA Subtypes
• Alopecia totalis: loss of all scalp hair and eyebrows
• Alopecia universalis: loss of all body hair

DDx of Scarring (Cicatricial) Alopecia
Developmental/Hereditary Disorders
• Aplasia cutis congenita
• Epidermal nevi
• Romberg’s syndrome
• Generalized follicular hamartoma
Primary Causes
• Group 1: Lymphocytic
• DLE
• Lichen planopilaris
• Central centrifugal cicatricial alopecia
• Classic pseudopelade
• Group 2: Neutrophilic
• Folliculitis decalvans
• Dissecting scalp cellulitis
• Group 3: Mixed
• Acne keloidalis nuchae
Secondary Causes
• Infectious agents
• Bacterial (e.g. post-cellulitis)
• Fungal (e.g. tinea capitis)
• Neoplasms (e.g. BCC, SCC, lymphomas, and metastatic tumours)
• Physical agents
• Mechanical trauma
• Burns
• Radiotherapy
• Caustic chemicals

Scarring (Cicatricial) Alopecia
Clinical Presentation
• irreversible loss of hair follicles with fibrosis
Etiology
• physical: radiation, burns
• infections: fungal, bacterial, TB, leprosy, viral (HZV)
• inflammatory
  ▪ lichen planus (lichen planopilaris)
  ▪ DLE (note that SLE can cause an alopecia unrelated to DLE lesions which are non-scarring)
  ▪ morphea: “coup de sabre” with involvement of centre of scalp
  ▪ central centrifugal cicatricial alopecia: seen in up to 40% of black women, starting at central scalp, one of most commonly diagnosed scarring alopecias, may be associated with hair care practices in this population
Investigations
• biopsy from active border
Management
• infections: treat underlying infection
• inflammatory: topical/intralesional steroids, anti-inflammatory antibiotics, antimalarials

Precipitants of Telogen Effluvium
“SEND” hair follicles out of anagen and into telogen
Stress and Scalp disease (surgery)
Endocrine (hypothyroidism, post-partum)
Nutritional (iron and protein deficiency)
Drugs (citretin, heparin, lithium, IFN, β-blockers, valproic acid, SSRIs)

Pediatric Exanthems

- see Pediatrics, P56

Miscellaneous Lesions

Angioedema and Urticaria

Angioedema
- deeper swelling of the skin involving subcutaneous tissues; often involves the eyes, lips, and tongue
- may or may not accompany urticaria
- hereditary or acquired forms
- hereditary angioedema (does not occur with urticaria)
  • onset in childhood; 80% have positive family history
  • recurrent attacks: 25% die from laryngeal edema
  • triggers: minor trauma, emotional upset, temperature changes
- types of acquired angioedema
  • acute allergic angioedema (allergens include food, drugs, contrast media, insect venom, latex)
  • non-allergic drug reaction (drugs include ACE inhibitors)
  • acquired C1 inhibitor deficiency
- treatment
  • prophylaxis with danazol or stanozolol for hereditary angioedema
  • epinephrine pen to temporize until patient reaches hospital in acute attack

Urticaria
- also known as "hives"
- transient, red, pruritic well-demarcated wheals
- each individual lesion lasts less than 24 h
- second most common type of drug reaction
- results from release of histamine from mast cells in dermis
- can also result after physical contact with allergen

<table>
<thead>

</table>

Urticarial Vasculitis
- Individual lesions last >24 h
- Often painful, less likely pruritic; heals with bruise type lesions
- Requires biopsy

DDx for Urticaria
DAM HIVES
Drugs and foods
Allergic
Malignancy
Hereditary
Infection
Vasculitis
Emotions
Stings

Approach to Urticaria
- Thorough Hx and P/E
- Acute: no immediate investigations needed; consider referral for allergy testing
- Chronic: further investigations required: CBC and differential, urinalysis, ESR, TSH, LFTs to help identify underlying cause
- Vasculitic: biopsy of lesion and referral to dermatology

Wheat
- Typically erythematous flat-topped, palpable lesions varying in size with circumscribed dermal edema
- Individual lesion lasts <24 h
- Associated with mast cell release of histamine
- May be pruritic

Mastocytosis (Urticaria Pigmentosa)
Rare disease due to excessive infiltration of the skin by mast cells. It manifests as many reddish-brown elevated plaques and macules. Friction to a lesion produces a wheal surrounded by intense erythema (Darier’s sign), due to mast cell degranulation; this occurs within minutes
**Erythema Nodosum**

**Clinical Presentation**
- acute or chronic inflammation of subcutaneous fat (panniculitis)
- round, red, tender, poorly demarcated nodules
- sites: asymmetrically arranged on extensor lower legs, knees, arms, (typically shins)
- associated with arthralgia, fever, malaise

**Etiology**
- 40% are idiopathic
- drugs: sulfonamides, OCPs (also pregnancy), analgesics, trans retinoic acid
- infections: GAS, TB, histoplasmosis, Yersinia
- inflammation: sarcoidosis, Crohn’s > UC
- malignancy: acute leukemia, Hodgkin’s lymphoma

**Epidemiology**
- 15-30 yr old, F:M = 3:1
- lesions last for days and spontaneously resolve in 6 wk

**Investigations**
- chest x-ray (to rule out chest infection and sarcoidosis)
- throat culture, ASO titre, PPD skin test

**Management**
- symptomatic: bed rest, compressive bandages, wet dressings
- NSAIDs, intralesional steroids
- treat underlying cause

**Pruritus**

**Clinical Presentation**
- a sensation provoking a desire to scratch, with or without skin lesions
- lesions may arise from the underlying disease, or from excoriation causing crusts, lichenified plaques, or wheals

**Etiology**
- dermatologic – generalized
  - asthetic dermatitis (“winter itch” due to dry skin)
  - pruritus of senescent skin (may not have dry skin, any time of year)
  - infestations: scabies, lice
  - drug eruptions: ASA, antidepressants, opiates
  - psychogenic states
- dermatologic – local
  - atopic and contact dermatitis, lichen planus, urticaria, insect bites, dermatitis herpetiformis
  - infection: varicella, candidiasis
  - lichen simplex chronicus
  - prurigo nodularis
- systemic disease – usually generalized
  - hepatic: obstructive biliary disease, cholestatic liver disease of pregnancy
  - renal: chronic renal failure, uremia secondary to hemodialysis
  - hematologic: Hodgkin’s lymphoma, multiple myeloma, leukemia, polycythemia vera, hemochromatosis, Fe deficiency anemia, cutaneous T-cell lymphoma
  - neoplastic: lung, breast, gastric (internal solid tumours), non-Hodgkin’s lymphoma
  - endocrine: carcinoid, DM, hypothyroidism/hyperthyroidism
  - infectious: HIV, trichinosis, echinococcosis, hepatitis C
  - psychiatric: depression, psychosis
  - neurologic: post-herpetic neuralgia, multiple sclerosis

**Investigations**
- blood work: CBC, ESR, Cr/BUN, LFT, TSH, fasting blood sugar, stool culture and serology for parasites

**Management**
- treat underlying cause
- cool water compresses to relieve pruritus
- bath oil and emollient ointment (especially if xerosis is present)
- topical corticosteroid and antipruritics (e.g. menthol, camphor, phenol, mirtazapine, capsaicin)
- systemic antihistamines: H1 blockers are most effective, most useful for urticaria
- phototherapy with UVB or PUVA
- doxepin, amitriptyline
- immunosuppressive agents if severe: steroids and steroid sparing

**Wounds and Ulcers**
- see Plastic Surgery, PL8, PL15
Common Medications

Sunscreens and Preventative Therapy

Sunburn
- erythema 2-6 h post UV exposure often associated with edema, pain and blistering with subsequent desquamation of the dermis, and hyperpigmentation
- chronic UVA, UVB exposure leads to photoaging, immunosuppression, photocarcinogenesis
- prevention: avoid peak UVR (10 am-4 pm), wear appropriate clothing, wide-brimmed hat, sunglasses, and broad-spectrum sunscreen
- clothing with UV protection expressed as UV protection factor (UPF) is analogous to SPF of sunscreen

Sunscreens
- under ideal conditions an SPF of 10 means that a person who normally burns in 20 min will burn in 200 min following the application of the sunscreen
- topical chemical: absorbs UV light
  - requires application at least 15-60 min prior to exposure, should be reapplied every 2 h (more often if sweating, swimming)
  - UVB absorbers: PABA, salicylates, cinnamates, benzylidene camphor derivatives
  - UVA absorbers: benzophenones, anthranilates, dibenzoylmethanes, benzylidene camphor derivatives
- topical physical: reflects and scatters UV light
  - titanium dioxide, zinc oxide, kaolin, talc, ferric chloride, and melanin
  - all are effective against the UVA and UVB spectrum
  - less risk of sensitization than chemical sunscreens and waterproof, but may cause folliculitis or miliaria
- some sunscreen ingredients may cause contact or photocontact allergic reactions, but are uncommon

Management
- sunburn: if significant blistering present, consider treatment in hospital; otherwise, symptomatic treatment (cool wet compresses, oral anti-inflammatory, topical corticosteroids)
- antioxidants, both oral and topical are being studied for their abilities to protect the skin; topical agents are limited by their ability to penetrate the skin

Topical Steroids

Calculation of strength of steroid compared to hydrocortisone on forearm: relative strength of steroid x relative percutaneous absorption

Surface Area

30 g covers full adult body once. Children have a greater surface area/volume ratio and there are consequently greater side effects

Side Effects of Topical Steroids
- Local: atrophy, perioral dermatitis, steroid acne, rosacea, contact dermatitis, tachyphylaxis (tolerance)
- Systemic: suppression of HPA axis

SPF = burn time with cream/burn time without cream
# Dermatologic Therapies

## Table 26. Common Topical Therapies

<table>
<thead>
<tr>
<th>Drug Name</th>
<th>Dosing Schedule</th>
<th>Indications</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Calcipotriol (Dovonex®)</td>
<td>0.005% cream, ointment, scalp solution, apply bid For maintenance therapy apply OD</td>
<td>Psoriasis</td>
<td>Burning, itching, skin irritation, worsening of psoriasis Avoid face, mucous membranes, eyes; wash hands after application Maximum weekly dosage of cream by age: 2-5 yr – 25 g/wk 6-10 yr – 50 g/wk 11-14 yr – 75 g/wk &gt;14 yr – 100 g/wk Inactivated by light (do not apply before phototherapy)</td>
</tr>
<tr>
<td>Imiquimod (Aldara®)</td>
<td>5% cream applied 3x/wk Apply at bedtime, leave on 6-10 h, then wash off with mild soap and water Max duration 16 wk</td>
<td>Genital warts Cutaneous warts AK Superficial BCC</td>
<td>Avoid natural/artificial sun exposure Local skin and application site reactions Erythema, ulceration, edema, flu-like symptoms Low toxicity, excellent results Works best for warts on mucosal surfaces May induce inflammation and erosion</td>
</tr>
<tr>
<td>Permethrin (Kwellada® P Lotion and Nix® Dermal Cream)</td>
<td>5% cream, applied once overnight to all skin areas from neck down, repeated one week later</td>
<td>Scabies (Kwellada-P Lotion, Nix® Dermal Cream) Pediculosis (Kwellada-P Crème Rinse®, Nix Crème Rinse®)</td>
<td>Do not use in children &lt;2 yr Hypersensitivity to drug, or known sensitivity to chrysanthemums Local reactions only (resolve rapidly); including burning, pruritus Low toxicity, excellent results Consider second application after 7 d</td>
</tr>
<tr>
<td>Pimecrolimus (Elidel®)</td>
<td>1.0% cream bid Use for as long as lesions persist and discontinue upon resolution of symptoms</td>
<td>AD (mild to moderate)</td>
<td>Burning Lacks adverse effects of steroids May be used on all skin surfaces including head, neck, and intertriginous areas Expense</td>
</tr>
<tr>
<td>Tacrolimus Topical (Protopic®)</td>
<td>0.03% (children) or 0.1% (adults) ointment bid Continue for duration of disease PLUS 1 wk after clearing</td>
<td>AD (mild to moderate)</td>
<td>Burning Lacks adverse effects of steroids May be used on all skin surfaces including head, neck, and intertriginous areas Expense</td>
</tr>
</tbody>
</table>

## Table 27. Common Oral Therapies

<table>
<thead>
<tr>
<th>Drug Name</th>
<th>Dosing Schedule</th>
<th>Indications</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Acitretin (Soriatane®)</td>
<td>25-50 mg PO OD; maximum 75 mg/d</td>
<td>Severe psoriasis</td>
<td>Monitoring strategies Monitor lipids, LFTs at baseline and q1-2wk until stable Contraindications Women of childbearing potential unless strict contraceptive requirements are met Drug interactions Other systemic retinoids, methotrexate, tetracyclines, certain contraceptives May be combined with PUVA phototherapy (known as re-PUVA)</td>
</tr>
<tr>
<td>Antivirals</td>
<td>famcyclovir (Famvir®) 250 mg PO tid x 7-10 d (for 1st episode of genital herpes) 125 mg PO bid x 5 d (for recurrent genital herpes)</td>
<td>Chickenpox Herpes zoster Genital herpes Acute and prophylactic to reduce transmission in infected patients Herpes labialis</td>
<td>Side effects Headache, nausea, diarrhea, abdominal pain Reduce dose if impaired renal function</td>
</tr>
<tr>
<td>Cyclosporin (Neoral®)</td>
<td>2-4 mg/kg/d PO divided bid Max 4 mg/kg/d After 4 wk may increase by 0.5 mg/kg/d q2wks Concomitant dose of magnesium may protect the kidneys</td>
<td>Psoriasis May also be effective in: Lichen planus EM Recalcitrant urticaria Recalcitrant AD</td>
<td>Monitoring strategies Blood pressure, renal function Contraindications Abnormal renal function, uncontrolled hypertension, malignancy (except NMSC), uncontrolled infection, immunodeficiency (excluding autoimmune disease), hypersensitivity to drug Long-term effects preclude use of cyclosporin for &gt;2 yr; discontinue earlier if possible May consider rotating therapy with other drugs to minimize adverse effects of each drug</td>
</tr>
<tr>
<td>Drug Name</td>
<td>Dosing Schedule</td>
<td>Indications</td>
<td>Comments</td>
</tr>
<tr>
<td>-----------</td>
<td>-----------------</td>
<td>-------------</td>
<td>----------</td>
</tr>
<tr>
<td><strong>Dapsone</strong></td>
<td>50-100-150 mg PO OD tapering to 25-50 mg PO OD to as low as 50 mg 2x/wk</td>
<td>Dermatitis herpetiformis, neutrophilic dermatoses</td>
<td>Monitoring strategies: Obtain G6PD levels before initiating; in the initial two wk obtain methemoglobin levels and follow blood counts carefully for the first few months. Side effects include Neuropathy, Hemolysis (Vitamin C and E supplementation can help prevent this). Drug interactions include Substrate of CYP2C8/9 (minor), 2C19 (minor), 2E1 (minor), 3A4 (major). Often a dramatic response within hours. Monitoring strategies: Obtain G6PD levels before initiating; in the initial two wk obtain methemoglobin levels and follow the blood counts carefully for the first few months.</td>
</tr>
<tr>
<td><strong>Isotretinoin</strong> (Accutane®)</td>
<td>0.5-1 mg/kg/d given OD, to achieve a total dose of 120 mg/kg (20-24 wk)</td>
<td>Severe nodular and/or inflammatory acne Acne conglobata Recalcitrant acne Widespread comedonal acne</td>
<td>Monitoring strategies: Baseline lipid profile and LFTs before treatment, β-hCG. Contraindications: Teratogenic – in sexually active females, 2 forms of reliable contraception necessary. Generally regarded as unsafe in lactation. Side effects: Night blindness, decreased tolerance to contact lenses, dry mucous membranes. May transiently exacerbate acne, dry skin. Depression, myalgia. Drug interactions: Do not use at the same time as tetracycline or minocycline – both may cause pseudotumour cerebri. Discontinue vitamin A supplements. Drug may be discontinued at 16-20 wk when nodule count has dropped by &gt;70%; a second course may be initiated after 2 mo prn. Refractory cases may require &gt;3 courses.</td>
</tr>
<tr>
<td><strong>Itraconazole</strong> (Sporanox®)</td>
<td>100-400 mg PO OD, depending on infection treated: Tinea corporis/cruris: 200 mg PO OD x 7 d Tinea pedis: 200 mg PO bid x 7 d Tinea versicolor: 200 mg PO OD x 7 d Toenails with or without fingernail involvement: 200 mg PO bid x 7 d once per month, repeated 3x. Fingernail involvement only: 200 mg bid PO x 7 d once per month, repeated 2x</td>
<td>Onychomycosis Tinea corporis, cruris, pedis, versicolor, capitis</td>
<td>Contraindications: CHF. Side effects: Serious hepatotoxicity. Drug Interactions: Inhibits CYP3A4. Increases concentration of some drugs metabolized by this enzyme (i.e. statins, diabetic drugs). Give capsules with food; capsules must be swallowed whole.</td>
</tr>
<tr>
<td><strong>Ivermectin</strong> (Mectizan®, Stromectol®)</td>
<td>200-250 µg/kg PO qweekly x 2 take once as directed; repeat one week later</td>
<td>Onchocerciasis (USA only). Not licensed for use in Canada. Also effective for: scabies.</td>
<td>No significant serious side effects. Efficacious.</td>
</tr>
<tr>
<td><strong>Methotrexate</strong> (Trexall®)</td>
<td>10-20 mg qwk, PO, IM, or IV Max: 30 mg/wk. To minimize side effects, administer with folic acid supplementation: 1-5 mg OD</td>
<td>Psoriasis AD Lymphomatoid papulosis May also be effective in: cutaneous sarcoidosis</td>
<td>Monitoring strategies: Baseline renal, liver, and hematological studies. Contraindications: Pregnancy, lactation, alcohol abuse, liver dysfunction, immunodeficiency syndrome, blood dyscrasias, hypersensitivity to drug. Restricted to severe, recalcitrant or disabling psoriasis not adequately responsive to other forms of therapy. May be combined with cyclosporine to allow lower doses of both drugs.</td>
</tr>
<tr>
<td><strong>Minocycline</strong> (Minocin®)</td>
<td>50-100 mg PO bid Taper to 50 mg PO OD as acne lessens</td>
<td>Acne vulgaris Rosacea</td>
<td>Contraindications: Caution if impaired renal or liver function. Drug interactions: Do not use with isotretinoin (Accutane®). Side effects: Extensive; affects multiple organ systems including CNS, teeth, eyes, bones, renal, and skin (photosensitivity and blue pigmentation). Drug-induced lupus (check p-ANCA). Alternative to tetracycline.</td>
</tr>
<tr>
<td><strong>OCPs</strong></td>
<td>TriCyclen Diane 35 Alesse</td>
<td>Hormonal acne (chin, jawline). Acne associated with polycystic ovarian syndrome or other endocrine abnormalities</td>
<td>Contraindications: Smoking, HIV, migraine with aura, pregnancy. Routine gynecological health maintenance should be up to date.</td>
</tr>
<tr>
<td><strong>Spironolactone</strong></td>
<td>50-100 mg PO OD alone or with OCPs</td>
<td>Hormonal acne (chin, jawline). Acne with endocrine abnormality</td>
<td>Contraindications: Menstrual irregularities at higher doses if not on OCPs. Breast tenderness, mild diuresis common. Risk of hyperkalemia – counsel patients to reduce intake of potassium rich foods such as bananas.</td>
</tr>
</tbody>

</table>
| **Terbinafine**  
(Lamisil®) | 250 mg PO OD x 2 wk  
Fingernails x 6 wk  
Toenails x 12 wk  
Confirm diagnosis prior to treatment | Onychomycosis  
Tinea corporis, cruris, pedis, capitis | Contraindications:  
Pregnancy, chronic or active liver disease  
Drug interactions:  
Potent inhibitor of CYP2D6; use with caution when also taking  
`-blockers, certain anti-arrhythmic agents, MAOI type B, and/or  
antipsychotics  
Drug concentrates rapidly in skin, hair, and nails at levels associated with fungicidal activity |
| **Tetracycline** | 250-500 mg PO bid to tid  
Taken 1 h before or 2 h after a meal | Acne vulgaris  
Rosacea  
Bullous pemphigoid | Contraindications:  
Severe renal or hepatic dysfunction |

## Initial Patient Assessment/Management

### 1. Rapid Primary Survey

- Airway maintenance with C-spine control
- Breathing and ventilation
- Circulation (pulses, hemorrhage control)
- Disability (neurological status)
- Exposure (complete) and Environment (temperature control)
- Continually reassessed during secondary survey
- **IMPORTANT**: Always watch for signs of shock while doing primary survey

#### A. AIRWAY

- First priority is to secure airway
- Assume a cervical injury in every trauma patient and immobilize with collar
- Assess ability to breathe and speak
- Can change rapidly, therefore reassess frequently
- Assess for facial fractures/edema/burns (impending airway collapse)

#### Airway Management

- Permit adequate oxygenation and ventilation

#### 1. Basic Airway Management

- Protect the C-spine
- Head-tilt (if C-spine injury not suspected) or jaw thrust to open the airway
- Sweep and suction to clear mouth of foreign material

#### 2. Temporizing Measures

- Nasopharyngeal airway (if gag reflex present, i.e. conscious)
- Oropharyngeal airway (if gag reflex absent, i.e. unconscious)
- “Rescue” airway devices (e.g. laryngeal mask airway, Combitube®)
- Transtracheal jet ventilation through cricothyroid membrane (last resort)

#### 3. Definitive Airway Management

- ETT intubation with in-line stabilization of C-spine
  - Oropharyngeal ± RSI preferred
  - Nasotracheal may be better tolerated in conscious patient
  - Relatively contraindicated with basal skull fracture
  - Does not provide 100% protection against aspiration
  - Surgical airway (if unable to intubate using oral/nasal route and unable to ventilate)
  - Cricothyroidotomy

**Contraindications to Intubation**

- Supraglottic/glottic pathology that would preclude successful intubation

---

### Approach to the Critically Ill Patient

1. Rapid Primary Survey (RPS)
2. Resuscitation (often concurrent with RPS)
3. Detailed Secondary Survey
4. Definitive Care

### Signs of Airway Obstruction

- Agitation, confusion, “universal choking sign”
- Respiratory distress
- Failure to speak, dysphonia
- Cyanosis

### Medications that can be Delivered via ETT

- Naloxone (Narcan®)
- Atropine
- Ventolin® (salmeterol)
- Epinephrine
- Lidocaine

---
**B. BREATHING**

- **Look**
  - mental status (anxiety, agitation, decreased LOC), colour, chest movement (bilateral vs. asymmetrical), respiratory rate/effort, nasal flaring
- **Listen**
  - auscultate for signs of obstruction (e.g. stridor), breath sounds, symmetry of air entry, air escaping
- **Feel**
  - tracheal shift, chest wall for crepitus, flail segments, sucking chest wounds, subcutaneous emphysema

**Breathing Assessment**
- objective measures of respiratory function: rate, oximetry, ABG, A-a gradient

**Management of Breathing**
- nasal prongs → simple face mask → non-rebreather mask → CPAP/BiPAP (in order of increasing FiO2)
- Venturi mask: used to precisely control O2 delivery
- Bag-Valve mask and CPAP to supplement inadequate ventilation

**C. CIRCULATION**

**Definition of Shock**
- inadequate organ and tissue perfusion with oxygenated blood (brain, kidney, extremities)

**Table 1. Major Types of Shock**

**Clinical Evaluation**
- early: tachypnea, tachycardia, narrow pulse pressure, reduced capillary refill, cool extremities, and reduced central venous pressure
- late: hypotension and altered mental status, reduced urine output

**Indications for Intubation**
- Unable to protect airway (e.g. GCS <8; airway trauma)
- Inadequate oxygenation with spontaneous respiration (O2 saturation <96% with 100% O2, or rising pCO2)
- Profound shock
- Anticipatory: in trauma, overdose, CHF, asthma, COPD, and smoke inhalation injury
- Anticipated transfer of critically ill patients

**Rescue Techniques in Intubation**
- Bougie (used like a guidewire)
- Glidescope®
- Lighted stylet (use light through skin to determine if ETT in correct place)
- Fiberoptic intubation – indirect visualization using fiberoptic cable

**Noisy breathing is obstructed breathing until proven otherwise**

**Shock in a trauma patient is hemorrhagic until proven otherwise**

**Causes of Shock**
- Septic, spinal/neurogenic, Hemorrhagic
- Obstetric (e.g. tension pneumothorax, cardiac tamponade, PE)
- Cardiogenic (e.g. blunt myocardial injury, dysrhythmia, MI)
- Anaphylactic
- Endocrine (e.g. Addison’s, myxedema, coma)
- Drugs

**Estimated Systolic Blood Pressure Based on Position of Most Distal Palpable Pulse**

<tbody>
<tr>
<td>Radial</td>
</tr>
<tr>
<td>Femoral</td>
</tr>
<tr>
<td>Carotid</td>
</tr>
</tbody>
</table>
Management of Hemorrhagic Shock
- clear airway and breathing either first or simultaneously
- apply direct pressure on external wounds while elevating extremities. Do not remove impaled objects in the emergency room setting as they may tamponade bleeds
- start TWO LARGE BORE (14-16G) IVs in the brachial/cephalic vein of each arm
- run 1-2 L bolus of IV Normal Saline/Ringer’s Lactate (warmed, if possible)
- if continual bleeding or no response to crystalloids, consider pRBC transfusion, ideally crossmatched. If crossmatched blood is unavailable, consider O- for women of childbearing age and O+ for men. Use FFP, platelets or tranexamic acid in early bleeding
- consider common sites of internal bleeding (abdomen, chest, pelvis, long bones) where surgical intervention may be necessary

D. DISABILITY
- assess LOC using GCS
  - pupils
    - assess equality, size, symmetry, reactivity to light
    - inequality/sluggish suggests local eye problem or lateralizing CNS lesion
    - relative afferent pupillary defect (swinging light test) – optic nerve damage
  - extraocular movements and nystagmus
  - fundoscopy (papilledema, hemorrhages)
  - reactive pupils + decreased LOC → metabolic or structural cause
  - non-reactive pupils + decreased LOC → structural cause (especially if asymmetric)
- Glasgow Coma Scale
  - for use in trauma patients with decreased LOC; good indicator of severity of injury and neurosurgical prognosis
  - most useful if repeated; change in GCS with time is more relevant than the absolute number
  - less meaningful for metabolic coma
  - patient with deteriorating GCS needs immediate attention
  - prognosis based on best post-resuscitation GCS
  - reported as a 3 part score: Eyes + Verbal + Motor = Total
  - if patient intubated, GCS score reported out of 10 + T (T = tubed, i.e. no verbal component)

Table 3. Glasgow Coma Scale

<table>

</tr>
</tbody>
</table>

13-15 = mild injury, 9-12 = moderate injury, ≤8 = severe injury
See Table 36, ER57 for modified GCS for infants and children

E. EXPOSURE/ENVIRONMENT
- undress patient completely and assess entire body for injury; log roll to examine back
- DRE
- keep patient warm with a blanket ± radiant heaters; avoid hypothermia
- warm IV fluids/blood
- keep providers safe (contamination, combative patient)

2. Resuscitation
- done concurrently with primary survey
- attend to ABCs
- manage life-threatening problems as they are identified
  - vital signs q5-15 min
  - ECG, BP, and O2 monitors
- Foley catheter and NG tube if indicated
- tests and investigations: CBC, electrolytes, BUN, Cr, glucose, amylase, INR/PTT, β-hCG, toxicology screen, cross and type

Fluid Resuscitation
- Give bolus until HR decreases, urine output increases, and patient stabilizes
- Maintenance: 4:2:1 rule
  - 0-10 kg: 4 cc/kg/h
  - 10-20 kg: 2 cc/kg/h
  - Remaining weight: 1 cc/kg/h
- Replace ongoing losses and deficits (assume 10% of body weight)

3:1 Rule
Since only 30% of infused isotonic crystalloids remains in intravascular space, you must give 3x estimated blood loss

Unilateral, Dilated, Non-Reactive Pupil, Think
- Focal mass lesion
- Epidural hematoma
- Subdural hematoma

Contraindications to Foley Insertion
- Blood at urethral meatus
- Scrotal hematoma
- High-riding prostate on DRE

NG Tube Contraindications
- Significant mid-face trauma
- Basal skull fracture

</tbody>
</table>

3. Secondary Survey

- done after rapid primary survey problems have been addressed
- identifies major injuries or areas of concern
- full physical exam and x-rays (C-spine, chest, pelvis – required in blunt trauma, consider T-spine and L-spine)

HISTORY

- “SAMPLE”: Signs and symptoms, Allergies, Medications, Past medical history, Last meal, Events related to injury

![FAST view: Normal vs Free Fluid](image-url)

**Figure 2. Four areas of a FAST**
PHYSICAL EXAM

Head and Neck
• palpation of facial bones, scalp

Chest
• inspect for: 1. midline trachea and 2. flail segment: ≥2 rib fractures in ≥2 places; if present look for associated hemothorax, pneumothorax, and contusions
• auscultate lung fields
• palpate for subcutaneous emphysema

Abdomen
• assess for peritonitis, abdominal distention, and evidence of intra-abdominal bleeding
• DRE for GI bleed, high riding prostate and anal tone

Musculoskeletal
• examine all extremities for swelling, deformity, contusions, tenderness, ROM
• check for pulses (using Doppler probe) and sensation in all injured limbs
• log roll and palpate thoracic and lumbar spines
• palpate iliac crests and pubic symphysis and assess pelvic stability (lateral, AP, vertical)

Neurological
• GCS
• full cranial nerve exam
• alterations of rate and rhythm of breathing are signs of structural or metabolic abnormalities with progressive deterioration in breathing indicating a failing CNS
• assess spinal cord integrity
• conscious patient: assess distal sensation and motor function
• unconscious patient: response to painful or noxious stimulus applied to extremities

INITIAL IMAGING
• non-contrast CT head/face/C-spine (rule out fractures and bleeds)
• chest x-ray
• FAST (see Figure 2) or CT abdomen/pelvis (if stable)
• pelvis x-ray

Ethical Considerations

Consent to Treatment: Adults
• see Ethical, Legal, and Organizational Medicine, ELOAM7
• Emergency Rule: consent is not needed when a patient is at imminent risk from a serious injury AND obtaining consent is either: a) not possible, OR b) would increase risk to the patient
  • assumes that most people would want to be saved in an emergency
• any capable and informed patient can refuse treatment or part of treatment, even if it is life-saving
• exceptions to the Emergency Rule - treatment cannot be initiated if
  • a competent patient has previously refused the same or similar treatment and there is no evidence to suggest the patient’s wishes have changed
  • an advanced directive is available (e.g. do not resuscitate order)
  • NOTE: refusal of help in a suicide situation is NOT an exception; care must be given
  • if in doubt, initiate treatment
• care can be withdrawn if necessary at a later time or if wishes are clarified by family

Consent to Treatment: Children
• treat immediately if patient is at imminent risk
• parents/guardians have the right to make treatment decisions
• if parents refuse treatment that is life-saving or will potentially alter the child’s quality of life, CAS must be contacted – consent of CAS is needed to treat

Other Issues of Consent
• need consent for HIV testing, as well as for administration of blood products
• however, if delay in substitute consent for blood transfusions puts patient at risk, transfusions can be given

Duty to Report
• law may vary depending on province and/or state
• examples: gunshot wounds, potential drunk drivers, suspected child abuse, various communicable diseases, medical unsuitability to drive, risk of substantial harm to others
## Traumatology

- epidemiology
  - leading cause of death in patients <45 yr
  - 4th highest cause of death in North America
  - causes more deaths in children/adolescents than all diseases combined
- trimodal distribution of death
  - minutes: lethal injuries, death usually at the scene
  - early: death within 4-6 h – “golden hour” (decreased mortality with trauma care)
  - days-weeks: death from multiple organ dysfunction, sepsis, etc.
- injuries fall into two categories
  - blunt (most common): MVC, pedestrian-automobile impact, motorcycle collision, fall, assault, sports
  - penetrating (increasing in incidence): gunshot wound, stabbing, impalement

### Considerations for Traumatic Injury

- important to know the mechanism of injury in order to anticipate traumatic injuries
- always look for an underlying cause (alcohol, medications, illicit substances, seizure, suicide attempt, medical problem)
- always inquire about HI, loss of consciousness, amnesia, vomiting, headache, and seizure activity

<table>
<thead>
<tr>
<th>Table 5. Mechanisms and Considerations of Traumatic Injuries</th>

<tr>
<td>Falls</td>
</tr>
</tbody>
</table>

## Head Trauma

- see Neurosurgery, NS29
- 60% of MVC-related deaths are due to HI

### Specific Injuries

- fractures
  - Dx: non-contrast head CT and physical exam
  - A. skull fractures
    - vault fractures
      - linear, non-depressed
        - most common
        - typically occur over temporal bone, in area of middle meningeal artery (commonest cause of epidural hematoma)
      - depressed
        - open (associated overlying scalp laceration and torn dura, skull fracture disrupting paranasal sinuses or middle ear) vs. closed
    - basal skull
      - typically occur through floor of anterior cranial fossa (longitudinal more common than transverse)
      - clinical diagnosis superior as poorly visualized on CT
  - B. facial fractures (see Plastic Surgery, PS29)
    - neuronal injury
    - beware of open fracture or sinus fractures (risk of infection)
    - severe facial fractures may pose risk to airway from profuse bleeding

- High Risk Injuries
  - MVC at high speed, resulting in ejection from vehicle
  - Motorcycle collisions
  - Vehicle vs. pedestrian crashes
  - Fall from height ≥12 ft (3.6 m)

### Signs of Basal Skull Fracture

- Battle’s sign (bruised mastoid process)
- Hemotympanum
- Raccoon eyes (periorbital bruising)
- CSF rhinorrhea/otorrhea
scalp laceration
- can be a source of significant bleeding
- achieve hemostasis, inspect and palpate for skull bone defects ± CT head (rule-out skull fracture)

neuronal injury
A. diffuse
- mild TBI = concussion
  - transient alteration in mental status that may involve loss of consciousness
    - hallmarks of concussion: confusion and amnesia, which may occur immediately after the trauma or minutes later
    - loss of consciousness (if present) must be less than 30 min, initial GCS must be between 13-15, and post-traumatic amnesia must be less than 24 h
- diffuse axonal injury
  - mild: coma 6-24 h, possibly lasting deficit
  - moderate: coma >24 h, little or no signs of brainstem dysfunction
  - severe: coma >24 h, frequent signs of brainstem dysfunction

B. focal injuries
- contusions
- intracranial hemorrhage (epidural, subdural, intracerebral)

ASSESSMENT OF BRAIN INJURY

History
- pre-hospital status
- mechanism of injury

Physical Exam
- assume C-spine injury until ruled out
- vital signs
  - shock (not likely due to isolated brain injury, except in infants)
  - Cushing's response to increasing ICP (bradycardia, HTN, irregular respirations)
- severity of injury determined by
  1. LOC
    - GCS ≤8 intubate, any change in score of 3 or more = serious injury
    - mild TBI = 13-15, moderate = 9-12, severe = 3-8
  2. pupils: size, anisocoria >1 mm (in patient with altered LOC), response to light
  3. lateralizing signs (motor/sensory)
    - may become more subtle with increasing severity of injury
- reassess frequently

Investigations
- labs: CBC, electrolytes, PT/PTT or INR/PTT, glucose, toxicology screen
- CT scan (non-contrast) to exclude intracranial hemorrhage/hematoma
- C-spine imaging, often with CT head and neck to exclude intracranial hemorrhage/hematoma

Management
- goal in ED: reduce secondary injury by avoiding hypoxia, ischemia, decreased CPP, seizure
- ABCs
  - ensure oxygen delivery to brain through intubation and prevent hypercarbia
  - maintain BP (sBP >90)
  - treat other injuries
- early neurosurgical consultation for acute and subsequent patient management
- medical management
  - seizure treatment/prophylaxis
    - benzodiazepines, phenytoin, phenobarbital
    - steroids are of no proven value
  - treat suspected raised ICP → consider if HI with signs of increased ICP:
    - intubate
    - calm (sedate) if risk for high airway pressures or agitation
    - paralyze if agitated
    - hyperventilate (100% O2) to a pCO2 of 30-35 mmHg
    - elevate head of bed to 20º
    - adequate BP to ensure good cerebral perfusion
    - diurese with mannitol 1g/kg infused rapidly (contraindicated in shock/renal failure)

Disposition
- neurological ICU admission for severe HI
- in hemodynamically unstable patient with other injuries, prioritize most life-threatening injuries and maintain cerebral perfusion
- for minor HI not requiring admission, provide 24 h HI protocol to competent caregiver, follow-up with neurology as even seemingly minor HI may cause lasting deficits
Mild Traumatic Brain Injury

Epidemiology
- TBI results in 1.7 million deaths, hospitalizations, and ED visits each year (US)
- 75% are estimated to be mild TBI; remainder are moderate or severe (see Neurosurgery, NS31)
- highest rates in children 0-4 yr, adolescents 15-19 yr, and elderly >65 yr

Clinical Features
- somatic: headache, sleep disturbance, N/V, blurred vision
- cognitive dysfunction: attentional impairment, reduced processing speed, drowsiness, amnesia
- emotion and behaviour: impulsivity, irritability, depression
- severe concussion: may precipitate seizure, bradycardia, hypotension, sluggish pupils

Etiology
- falls, MVC, struck by an object, assault, sports

Investigations
- neurological exam
- concussion recognition tool (see thinkfirst.ca)
- imaging – CT as per Canadian CT Head Rules, or MRI if worsening symptoms despite normal CT

Treatment
- close observation and follow-up; for patients at risk of intracranial complications, give appropriate discharge instructions to patient and family; watch for changes to clinical features above, and if change, return to ED
- hospitalization with normal CT (GCS <15, seizures, bleeding diastasis), or with abnormal CT
- early rehabilitation to maximize outcomes
- pharmacological management of pain, depression, headache
- follow Return to Play guidelines

Prognosis
- most recover with minimal treatment
- athletes with previous concussion are at increased risk of cumulative brain injury
- repeat TBI can lead to life-threatening cerebral edema or permanent impairment

Spine and Spinal Cord Trauma

- assume cord injury with significant falls (>12 ft), deceleration injuries, blunt trauma to head, neck, or back
- spinal immobilization (cervical collar, spine board during patient transport only) must be maintained until spinal injury has been ruled out (Figure 3)
- vertebral injuries may be present without spinal cord injury; normal neurologic exam does not exclude spinal injury
- cord may be injured despite normal C-spine x-ray (SCIWORA = spinal cord injury without radiologic abnormality)
- injuries can include: complete/incomplete transection, cord edema, spinal shock

History
- mechanism of injury, previous deficits, SAMPLE
- neck pain, paralysis/weakness, paresthesia

Physical Exam
- ABCs
- abdominal: ecchymosis, tenderness
- neurological: complete exam, including mental status
- spine: maintain neutral position, palpate C-spine; log roll, then palpate T-spine and L-spine, assess rectal tone
  - when palpating, assess for tenderness, muscle spasm, bony deformities, step-off, and spinous process malalignment
- extremities: check capillary refill, suspect thoracolumbar injury with calcaneal fractures

Investigations
- bloodwork: CBC, electrolytes, Cr, glucose, coagulation profile, cross and type, toxicology screen
- imaging
  - full C-spine x-ray series for trauma (AP, lateral, odontoid)
- thoracolumbar x-rays
  - AP and lateral views
  - indications
    - patients with C-spine injury
    - unconscious patients (with appropriate mechanism of injury)
For Alert (GCS Score = 15) and Stable Trauma Patients where C-Spine Injury is a Concern

1. Any high-risk factor that mandates radiography?
   - Age ≥ 65 yr
   - Dangerous mechanism*
   - Paresthesia in extremities

2. Any one low-risk factor that allows safe assessment of ROM?
   - Simple rear-end MVC†
   - Sitting position in ED
   - Ambulatory at any time
   - Delayed onset of neck pain§
   - Absence of midline C-spine tenderness

3. Able to actively rotate neck? >45º left and right

   - Yes
   - No radiography

   - No
   - Radiography

   - Unable

Suspected C-Spine Injury
** based on mechanism of injury (e.g. MVC, fall, sports)

History: midline neck pain, numbness or paresthesia, presence of distracting pain, head injury, intoxication, loss of consciousness or past history of spinal mobility disorder

Physical exam: posterior neck spasm, tenderness or crepitus, any neurologic deficit or autonomic dysfunction, altered mental state

Management of Cord Injury
- immobilize
- evaluate ABCs
- treat neurogenic shock (maintain sBP >100 mmHg)
- insert NG and Foley catheter
- high dose steroids: methylprednisolone 30 mg/kg bolus, then 5.4 mg/kg/h drip, start within 6-8 h of injury (controversial and recently has less support)
- complete imaging of spine and consult spine service if available
- continually reassess high cord injuries as edema can travel up cord
- if cervical cord lesion, watch for respiratory insufficiency
  - low cervical transection (C5-T1) produces abdominal breathing (phrenic innervation of diaphragm still intact)
  - high cervical cord injury (above C4) may require intubation and ventilation
- treatment: warm blanket, Trendelenburg position (occasionally), volume infusion, consider vasopressors

Approach to C-Spine X-Rays
- 3-view C-spine series is the screening modality of choice
  1. lateral C1-T1 ± swimmer’s view
  - lateral view is best, identifies 90-95% of injuries
  2. odontoid view (open mouth or oblique submental view)
  - examine the dens for fractures
  - if unable to rule out fracture, repeat view or consider CT or plain film tomography
  - examine lateral aspects of C1 and spacing relative to C2
  3. AP view
  - alignment of spinous processes in the midline
  - spacing of spinous processes should be equal
  - check vertebral bodies and facet dislocations

Flexible, submental, anteroposterior (AP) views of the cervical spine are the preferred imaging method for the evaluation of suspected cervical spine injuries.

Prevertebral soft tissue swelling is only 49% sensitive for injury
Table 6. Interpretation of Lateral View: The ABCS

A Adequacy and Alignment
- Must see C1 to C7-T1 junction; if not, downward traction of shoulders, swimmer’s view, bilateral supine obliques, or CT scan needed
- Lines of contour in children <8 yr of age, can see physiologic subluxation of C2 on C3, and C3 on C4, but the spino-laminal line is maintained
- Fanning of spinous processes suggests posterior ligamentous disruption
- Widening of facet joints
- Check atlanto-occipital joint
- Line extending inferiorly from clivus should transect odontoid
- Atlanto-axial articulation, widening of predental space (normal: <3 mm in adults, <5 mm in children) indicates injury of C1 or C2

B Bones
- Height, width, and shape of each vertebral body
- Pedicles, facets, and laminae should appear as one – doubling suggests rotation

C Cartilage
- Intervertebral disc spaces – wedging anteriorly or posteriorly suggests vertebral compression

S Soft Tissues
- Widening of retropharyngeal (normal: <7 mm at C1-4, may be wide in children <2 yr on expiration) or retrotracheal spaces (normal: <22 mm at C6-T1, <14 mm in children <5 yr)

Sequelea of C-Spine Fractures
- see Neurosurgery, NS33
  - acute phase of SCI
    - spinal shock: absence of all voluntary and reflex activity below level of injury
      - decreased reflexes, no sensation, flaccid paralysis below level of injury, lasting days to months
    - neurogenic shock: loss of vasomotor tone, SNS tone
      - watch for: hypotension (lacking SNS), bradycardia (unopposed PNS), poikilothermia (lacking SNS so no shunting of blood from extremities to core)
      - occurs within 30 min of SCI at level T6 or above, lasting up to 6 wk
      - provide airway support, fluids, atropine (for bradycardia), vasopressors for BP support
  - chronic phase of SCI
    - autonomic dysreflexia: in patients with an SCI at level T6 or above
      - signs and symptoms: pounding headache, nasal congestion, feeling of apprehension or anxiety, visual changes, dangerously increased sBP and dBP
      - common triggers
        - GU causes: bladder distention, urinary tract infection, and kidney stones
        - GI causes: fecal impaction or bowel distension
      - treatment: monitoring and controlling BP, prior to addressing causative issue

Chest Trauma
- two types: those found and managed in 1º survey and those found and managed in 2º survey

Table 7. Life-Threatening Chest Injuries Found in 1º Survey

<table>
<thead>
<tr>
<th>Physical Exam</th>
<th>Investigations</th>
<th>Management</th>

</tbody>
</table>

Other Potentially Life-Threatening Injuries Related to the Chest

Penetrating Neck Trauma
- includes all penetrating trauma to the three zones of the neck
- management: injuries deep to platysma require further evaluation by angiography, contrast CT, or surgery
- do not explore penetrating neck wounds except in the OR
Airway Injuries
• always maintain a high index of suspicion
• larynx
  ▪ history: strangulation, direct blow, blunt trauma, any penetrating injury involving platysma
  ▪ triad: hoarseness, subcutaneous emphysema, palpable fracture
  ▪ other symptoms: hemoptysis, dyspnea, dysphonia
  ▪ investigations: CXR, CT scan, arteriography (if penetrating)
• management
  ▪ airway: manage early because of edema
  ▪ C-spine may also be injured, consider mechanism of injury
  ▪ surgical: tracheotomy vs. repair

trachea/bronchus
• frequently missed
• history: deceleration, penetration, increased intra-thoracic pressure, complaints of dyspnea, hemoptysis
• examination: subcutaneous air, Hamman’s sign (crunching sound synchronous with heart beat)
• CXR: mediastinal air, persistent pneumothorax or persistent air leak after chest tube inserted for pneumothorax
• management: surgical repair if >1/3 circumference

Abdominal Trauma
• two mechanisms
  ▪ blunt: usually causes solid organ injury (spleen = most common, liver = 2nd)
  ▪ penetrating: usually causes hollow organ injury or liver injury (most common)

BLUNT TRAUMA
• results in two types of hemorrhage: intra-abdominal and retroperitoneal
• adopt high clinical suspicion of bleeding in multi-system trauma

History
• mechanism of injury, SAMPLE history

Physical Exam
• often unreliable in multi-system trauma, wide spectrum of presentations
  ▪ slow blood loss not immediately apparent
  ▪ tachycardia, tachypnea, oliguria, febrile, hypotension
  ▪ other injuries may mask symptoms
  ▪ serial examinations are required
• abdomen
  ▪ inspect: contusions, abrasions, seat-belt sign, distention
  ▪ auscultate: bruits, bowel sounds
  ▪ palpate: tenderness, rebound tenderness, rigidity, guarding
  ▪ DRE: rectal tone, blood, bone fragments, prostate location
  ▪ placement of NG, Foley catheter should be considered part of the abdominal exam
• other systems to assess: cardiovascular, respiratory (possibility of diaphragm rupture), genitourinary, pelvis, back/neurological

Investigations
• labs: CBC, electrolytes, coagulation, cross and type, glucose, Cr, CK, lipase, amylase, liver enzymes, ABG, blood EtOH, β-hCG, U/A, toxicology screen

Table 9. Imaging in Abdominal Trauma
<table>
<thead>
<tr>
<th>Imaging</th>
<th>Strengths</th>
<th>Limitations</th>
</tr>
</thead>
<tbody>
<tr>
<td>X-Ray</td>
<td>Chest (looking for free air under diaphragm, diaphragmatic hernia, air-fluid levels), pelvis, cervical, thoracic, lumbar spines</td>
<td>Soft tissue not well visualized</td>
</tr>
<tr>
<td>CT Scan</td>
<td>Most specific test</td>
<td>Radiation exposure 20x more than x-ray Cannot use if hemodynamic instability</td>
</tr>
<tr>
<td>Diagnostic Peritoneal Lavage (rarely used)</td>
<td>Most sensitive test Tests for intra-peritoneal bleed</td>
<td>Cannot test for retroperitoneal bleed or diaphragmatic rupture Cannot distinguish lethal from trivial bleed Results can take up to 1 h</td>
</tr>
<tr>
<td>Ultrasound: FAST</td>
<td>Identifies presence/absence of free fluid in peritoneal cavity RAPID exam: less than 5 min Can also examine pericardium and pleural cavities</td>
<td>NOT used to identify specific organ injuries If patient has ascites, FAST will be falsely positive</td>
</tr>
</tbody>
</table>

Criteria for Positive Lavage
• >10 cc gross blood
• Bile, bacteria, foreign material
• RBC count >100,000 x 10^6/L
• WBC >500 x 10^6/L
• Amylase >175 IU
imaging must be done if
- equivocal abdominal examination, altered sensorium, or distracting injuries (e.g. head trauma, spinal cord injury resulting in abdominal anesthesia)
- unexplained shock/hypotension
- multiple trauma patients who must undergo general anesthesia for orthopedic, neurosurgical, or other injuries
- fractures of lower ribs, pelvis, spine
- positive FAST

**Management**
- general: ABCs, fluid resuscitation, and stabilization
- surgical: watchful waiting vs. laparotomy
- solid organ injuries: decision based on hemodynamic stability, not the specific injuries
- hemodynamically unstable or persistently high transfusion requirements: laparotomy
- hollow organ injuries: laparotomy
- even if low suspicion of injury: admit and observe for 24 h

**Penetrating Trauma**
- high risk of gastrointestinal perforation and sepsis
- history: size of blade, calibre/distance from gun, route of entry
- local wound exploration under direct vision may determine lack of peritoneal penetration (not reliable in inexperienced hands) with the following exceptions:
  - thoracoabdominal region (may cause pneumothorax)
- back or flanks (muscles too thick)

**Etiology**
- blunt trauma: often associated with pelvic fractures
  - upper tract
    - renal
    - contusions (minor injury – parenchymal ecchymoses with intact renal capsule)
    - parenchymal tears/laceration: non-communicating (hematoma) vs. communicating (urine extravasation, hematuria)
  - ureter: rare, at uretero-pelvic junction
- lower tract
  - bladder
  - extraperitoneal rupture of bladder from pelvic fracture fragments
  - intraperitoneal rupture of bladder from trauma and full bladder
  - urethra
  - posterior urethral injuries: MVCs, falls, pelvic fractures
  - anterior urethral injuries: blunt trauma to perineum, straddle injuries/direct strikes
- external genitalia
- penetrating trauma
  - damage to: kidney, bladder, ureter (rare), external genitalia
- acceleration/deceleration injury
  - renal pedicle injury: high mortality rate (laceration and thrombosis of renal artery, renal vein, and their branches)
- iatrogenic
  - ureter and urethra (from instrumentation)

**History**
- mechanism of injury
- hematuria (microscopic or gross), blood on underwear
- dysuria, urinary retention
- history of hypotension

**Physical Exam**
- abdominal pain, flank pain, CVA tenderness, upper quadrant mass, perineal lacerations
- DRE: sphincter tone, position of prostate, presence of blood
- scrotum: ecchymoses, lacerations, testicular disruption, hematomas
- bimanual exam, speculum exam
extraperitoneal bladder rupture: pelvic instability, suprapubic tenderness from mass of urine or extravasated blood
intraperitoneal bladder rupture: acute abdomen
urethral injury: perineal ecchymosis, scrotal hematoma, blood at penile meatus, high riding prostate, pelvic fractures

**Investigations**
- urethra: retrograde urethrography
- bladder: U/A, CT scan, urethrogram ± retrograde cystoscopy ± cystogram (distended bladder + post-void)
- ureter: retrograde ureterogram
- renal: CT scan (best, if hemodynamically stable), intravenous pyelogram

**Management**
- urology consult
- renal
  - minor injuries: conservative management
    - bedrest, hydration, analgesia, antibiotics
  - major injuries: admit
    - conservative management with frequent reassessments, serial U/A ± re-imaging
    - surgical repair (exploration, nephrectomy): hemodynamically unstable or continuing to bleed >48 h, major urine extravasation, renal pedicle injury, all penetrating wounds and major lacerations, infections, renal artery thrombosis
- ureter
  - ureterouretostomy
- bladder
  - extraperitoneal
    - minor rupture: Foley drainage x 10-14 d
    - major rupture: surgical repair
  - intraperitoneal
    - drain abdomen and surgical repair
- urethra
  - anterior: conservative, if cannot void → Foley or suprapubic cystostomy and antibiotics
  - posterior: suprapubic cystostomy (avoid catheterization) ± surgical repair

**Orthopedic Injuries**
- Orthopedics (Shoulder OR11, Knee OR32, Wrist OR20, Ankle OR38)

**Goals of ED Treatment**
- diagnose potentially life/limb threatening injuries
- reduce and immobilize fractures (cast/splint) as appropriate
- provide adequate pain relief
- arrange proper follow-up if necessary

**History**
- use SAMPLE
- mechanism of injury may be very important

**Physical Exam**
- look (inspection): “SEADS” Swelling, Erythema, Atrophy, Deformity, Skin changes (e.g. bruises)
- feel (palpation): all joints/bones for local tenderness, swelling, warmth, crepitus, joint effusions, subtle deformity
- move: joints affected plus those above and below injury – active ROM preferred to passive
  - neurovascular status: distal to injury (before and after reduction)

**LIFE- AND LIMB-THREATENING INJURIES**

<table>
<thead>
<tr>
<th>Life-Threatening Injuries (usually blood loss)</th>
<th>Limb-Threatening Injuries (usually interruption of blood supply)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Major pelvic fractures</td>
<td>Fracture/dislocation of ankle (talar AVN)</td>
</tr>
<tr>
<td>Traumatic amputations</td>
<td>Crush injuries</td>
</tr>
<tr>
<td>Massive long bone injuries (beware of fat emboli)</td>
<td>Compartment syndrome</td>
</tr>
<tr>
<td>Vascular injury proximal to knee/elbow</td>
<td>Open fractures</td>
</tr>
<tr>
<td></td>
<td>Dislocations of knee/hip</td>
</tr>
<tr>
<td></td>
<td>Fractures above knee/elbow</td>
</tr>
</tbody>
</table>
Open Fractures
- communication between fracture site and external surface of skin – increased risk of osteomyelitis
- remove gross debris, irrigate, cover with sterile dressing – formal irrigation and debridement often done in the OR
- control bleeding with pressure (no clamping)
- splint
- antibiotics (1st generation cephalosporin and aminoglycoside) and tetanus prophylaxis
- must secure definitive surgical care within 6-8 h

Vascular Injuries
- realign limb/apply longitudinal traction and reassess pulses (e.g. Doppler probe)
- surgical consult
- direct pressure if external bleeding

Compartment Syndrome
- increased interstitial pressure in an anatomical “compartment” (forearm, calf) with little room for expansion, resulting in decreased perfusion and potential muscle/nerve necrosis
- clinical diagnosis: maintain a high index of suspicion
  - pain out of proportion to the injury
  - pain worse with passive stretch
  - look for “the 6 Ps”
- requires prompt decompression: remove constrictive casts, dressings; fasciotomy may be needed emergently

UPPER EXTREMITY INJURIES
- anterior shoulder dislocation
  - axillary nerve (lateral aspect of shoulder) and musculocutaneous nerve (extensor aspect of forearm) at risk
  - seen on lateral view: humeral head anterior to glenoid
    - reduce (traction, scapular manipulation), immobilize in internal rotation, repeat x-ray, out-patient follow-up with orthopedics
    - with forceful injury, look for fracture
  - Colles’ fracture
    - distal radius fracture with dorsal displacement from “Fall on Outstretched Hand” (FOOSH)
    - AP film: shortening, radial deviation, radial displacement
    - lateral film: dorsal displacement, volar angulation
    - reduce, immobilize with splint, out-patient follow-up with orthopedics or immediate orthopedic referral if complicated fracture
    - if involvement of articular surface, emergent orthopedic referral
  - scaphoid fracture
    - tenderness in anatomical snuff box, pain on scaphoid tubercle, pain on axial loading of thumb
    - negative x-ray: thumb spica splint, repeat x-ray in 1 wk ± CT scan/bone scan
    - positive x-ray: thumb spica splint x 6-8 wk, repeat x-ray in 2 wk
    - risk of AVN of scaphoid if not immobilized
    - outpatient orthopedics follow-up

LOWER EXTREMITY INJURIES
- ankle and foot fractures
  - see Ottawa Ankle and Foot Rules
- knee injuries
  - see Ottawa Knee Rules
  - avulsion of the base of 5th metatarsal
    - occurs with inversion injury
    - supportive tensor or below knee walking cast for 3 wk
- calcaneal fracture
  - associated with fall from height
  - associated injuries may involve ankles, knees, hips, pelvis, lumbar spine

Figure 9. Ottawa knee rules

A knee x-ray examination is required only for acute injury patients with one or more of:
- Age 55 yr or older
- Tenderness at head of fibula
- Isolated tenderness of patella
- Inability to flex to 90º
- Inability to bear weight both immediately and in the ED (four steps)

Adapted from: Stiell IG, et al. JAMA 1997;278:2075-2079
Wound Management

Goals of ED Treatment
- identify injuries and stop any active bleeding – direct pressure
- manage pain
- wound examination and exploration (history and physical)
- cleansing ± antibiotic and tetanus prophylaxis
- closure and dressing

Tetanus Prophylaxis
- both tetanus toxoid (Td) and immunoglobulin (TIG) are safe in pregnancy

<table>

¹ wounds >6 h old, >1 cm deep, puncture wounds, avulsions, wounds resulting from missiles, crush wounds, burns, frostbite, wounds contaminated with dirt, feces, soil, or saliva
² 0.5 mL IM tetanus and diphtheria toxoids (Td), adsorbed
³ tetanus immune globulin (TIG), 250 units deep IM
Source: MMWR 2001;50;418-427; MMWR 1991;40:1-52

Bruises
- non-palpable = ecchymosis
- palpable collection (not swelling) = hematoma following blunt trauma
- assess for coagulopathy (e.g. liver disease), anticoagulant use

Abrasions
- partial to full thickness break in skin
- management
  - clean thoroughly with brush to prevent foreign body impregnation ± local anesthetic antiseptic ointment (Polysporin® or Vaseline®) for 7 d for facial and complex abrasions
  - tetanus prophylaxis

Lacerations
- see Plastic Surgery, PL8
- consider every structure deep to a laceration injured until proven otherwise
- in hand injury patients, include the following in history: handedness, occupation, mechanism of injury, previous history of injury

Accuracy of Ottawa Ankle Rules to Exclude Fractures of the Ankle and Mid-Foot: Systematic Review
BMJ 2003;326;417
This systematic review and meta-analysis of 27 studies including 15,581 patients evaluated the sensitivity and specificity of the Ottawa Ankle Rules for excluding fractures of the ankle and mid-foot.
Results: The pooled likelihood ratio of a negative result (obtaining a false negative) among those with a fracture was determined to be 0.08 for both the ankle and mid-foot.
Conclusions: The Ottawa Ankle Rules provide an accurate instrument for excluding fractures of the ankle and mid-foot with a sensitivity of almost 100% and a specificity of 26%. The use of this instrument can reduce the number of unnecessary radiographs.

Acute Treatment of Contusions
RICE
Rest
Ice
Compression
Elevation

High Risk Factors for Infection
Wound Factors
- Puncture wounds
- Crush injuries
- Wounds >12 h old
- Hand or foot wounds
- Immunocompromised
Patient Factors
- Age >50 yr
- Prosthetic joints or valves (risk of endocarditis)

Suture Use and Duration

N.B. Patients on steroid therapy may need sutures for longer periods of time
• physical exam
  • think about underlying anatomy
  • examine tendon function actively against resistance and neurovascular status distally
  • clean and explore under local anesthetic; look for partial tendon injuries
  • x-ray or U/S wounds if a foreign body is suspected (e.g. shattered glass) and not found when exploring wound (remember: not all foreign bodies are radioopaque), or if suspect intra-articular involvement

• management
  • disinfect skin/use sterile techniques
  • irrigate copiously with normal saline
  • analgesia ± anesthesia
  • maximum dose of lidocaine
    • 7 mg/kg with epinephrine
    • 5 mg/kg without epinephrine
  • in children, topical anesthetics such as LET (lidocaine, epinephrine and tetracaine), and in selected cases a short-acting benzodiazepine (midazolam or other agents) for sedation and amnesia are useful
  • secure hemostasis
  • evacuate hematomas, debride non-viable tissue, remove hair and foreign bodies
  • ± prophylactic antibiotics (consider for animal/human bites, intraoral lesion, or puncture wounds to the foot)
  • suture unless: delayed presentation (>6-8 h), puncture wound, mammalian bite, crush injury, or retained foreign body
  • take into account patient and wound factors when considering suturing
  • advise patient when to have sutures removed
  • cellulitis and necrotizing fasciitis (see Plastic Surgery, PL14)

</table>

• differential can be focused anatomically by location of pain: RUQ, LUQ, RLQ, LLQ, epigastric, periumbilical, diffuse

History
• pain: OPQRST
• review symptoms from GU, gynecological, GI, respiratory, and CV systems
• abdominal trauma/surgeries most recent colonoscopy

Physical Exam
• vitals, abdominal (including DRE, CVA tenderness), pelvic/genital, respiratory, and cardiac exams as indicated by history

Investigations
• ABCs, do not delay management and consultation if patient unstable
• CBC, electrolytes, glucose, BUN/Cr, U/A ± liver enzymes, LFTs, lipase, β-hCG, ECG, troponins, ± VBG/lactate
• AXR: look for calcifications, free air, gas pattern, air fluid levels

Approach to Common ED Presentations

Abdominal Pain

Be vigilant: very young, elderly, alcoholics, immunosuppressed patients often present atypically

Old age, pregnancy (T3), and chronic corticosteroid use can blunt peritoneal findings, so have an increased level of suspicion for an intra-abdominal process in these individuals

Unstable patients should not be sent for imaging

If elevated AST and ALTT
Think hepatocellular injury
AST > ALT: alcohol-related
ALT > AST: viral, drug, toxin

If elevated ALP and GGT
Think biliary tree obstruction
• CXR upright: look for pneumoperitoneum (free air under diaphragm), lung disease
• U/S: biliary tract, ectopic pregnancy, AAA, free fluid
• CT: trauma, AAA, pancreatitis, nephro-/urothiasis, appendicitis, and diverticulitis

Management
• NPO, IV, NG tube, analgesics, consider antibiotics and anti-emetics
• growing evidence that small amounts of opioid analgesics improve diagnostic accuracy of physical exam of surgical abdomen
• consult as necessary: general surgery, vascular surgery, gynecology, etc.

Disposition
• admission: surgical abdomen, workup of significant abnormal findings, need for IV antibiotics or pain control
• discharge: patients with a negative lab and imaging workup who improve clinically during their stay; instruct the patient to return if severe pain, fever, or persistent vomiting develops

Acute Pelvic Pain

Etiology
• gynecological
  ▪ second most common gynecological complaint (after vaginal bleeding)
  ▪ ovaries: ruptured ovarian cyst (most common cause of pelvic pain), ovarian abscess, ovarian torsion (rare, 50% will have ovarian mass)
  ▪ fallopian tubes: salpingitis, tubal abscess, hydrosalpinx
  ▪ uterus: leiomyomas (uterine fibroids) – especially with torsion of a pedunculated fibroid or in a pregnant patient (degeneration), PID, endometriosis
  ▪ other: ectopic pregnancy (ruptured/expanding/leaking), spontaneous abortion (threatened or incomplete), endometriosis and dysmenorrhea, sexual or physical abuse
• non-gynecological (see causes of lower abdominal pain above)

History and Physical Exam
• pain: OPQRST
• associated symptoms: vaginal bleeding, discharge, dyspareunia, bowel or bladder symptoms
• pregnancy and sexual history
• vitals
• gynecological exam: assess for cervical motion tenderness/”chandelier sign” (suggests PID)
• abdominal exam

Investigations
• β-hCG for all women of childbearing age
• CBC and differential, electrolytes, glucose, Cr, BUN, G&S, PTT/INR
• vaginal and cervical swabs for C&S during physical exam
• pelvic and abdominal U/S: evaluate adnexa, thickness of endometrium, pregnancy, free fluid or masses in the pelvis
• Doppler flow studies for ovarian torsion

Management
• general: analgesia, determine if admission and consults are needed
• specific
  ▪ ovarian cysts
    ▪ unruptured or ruptured and hemodynamically stable: analgesia and follow-up
    ▪ ruptured with significant hemoperitoneum: may require surgery
  ▪ ovarian torsion: surgical detorsion or removal of ovary
  ▪ uncomplicated leiomyomas, endometriosis, and secondary dysmenorrhea can usually be treated on an outpatient basis, discharge with gynecology follow-up
  ▪ PID: requires broad spectrum antibiotics

Disposition
• referral: gynecological or obstetrical causes requiring surgical intervention, requiring admission, or oncological in nature
• admission: patients requiring surgery, IV antibiotics/pain management
• discharge: negative workup and resolving symptoms; give clear instructions for appropriate follow-up

Analgesia in Patients with Acute Abdominal Pain
Cochrane database of systemic reviews 2011, issue 1. Art. No.:CD005660
Study: systematic review of all RCTs of adult patients with acute abdominal pain (AAP) comparing use of opioid analgesia during initial evaluation with placebo. Included in the review:8 RCTs.
Population: patients age >14 with non traumatic AAP <1 week duration.
Intervention: six trials used morphine, one trial used Tramadol, one study Papaveretum as analgesia.
Main outcome measure: diagnostic accuracy.
Results: there were no significant differences in the physical examination among the groups or when comparing by drug. There were no significant differences in rate of ‘incorrect diagnosis’ among the groups.
Conclusion: the use of analgesia for acute abdominal pain does not increase risk of diagnostic error and does not mask clinical findings.

Gynecological Causes of Pelvic Pain
• Ovarian cyst
• Dysmenorrhea
• Mittelschmerz
• Endometriosis
• Ovarian torsion
• Uterine Fibroids/neoplasm
• Adnexal neoplasm
• PID + cervicitis

U/S is the preferred imaging modality in the assessment of acute pelvic pain
Altered Level of Consciousness

Definitions
- altered mental status: collective, non-specific term referring to change in cognitive function, behaviour, or attentiveness, including:
  - delirium (see Psychiatry, PS20)
  - dementia (see Psychiatry, PS21)
  - lethargy: state of decreased awareness and alertness (patient may appear wakeful)
  - stupor: unresponsiveness but rousable
  - coma: a sleep-like state, not rousable to consciousness

Figure 11. Etiology of coma

MANAGEMENT OF ALTERED LOC

History
- obtain collateral from family, friends, police, paramedics, old chart, MedicAlert® bracelet, etc.
- onset and progression
  - antecedent trauma, seizure activity, fever
  - abrupt onset suggests CNS hemorrhage/ischemia or cardiac cause
  - progression over hours to days suggests progressive CNS lesion or toxic/metabolic cause
- determine patient's baseline LOC
- past medical history (e.g. similar episode, depression, overdose)

Physical Exam
- ABCs, vitals including temperature; cardiac, respiratory, abdominal exams
- complete neurological exam; in particular, examination of the eyes (pupil size and reactivity)
  - use the GCS to evaluate LOC (see Initial Patient Assessment/Management, ER2)

Investigations
- blood work
  - rapid blood sugar, CBC, electrolytes, Cr, BUN, LFTs, glucose, serum osmolality, VBG, PT/PTT/INR, troponins
  - serum EtOH, acetaminophen, and salicylate levels
- imaging
  - CXR, CT head
- other tests
  - ECG, U/A, UTox

Diagnosis
- administer appropriate universal antidotes
  - thiamine 100 mg IV if history of EtOH or patient looks malnourished
  - one ampule D50W IV if low blood sugar on finger-prick
  - naloxone 0.4-2 mg IV or IM if opiate overdose suspected
- distinguish between structural and toxic-metabolic coma
  - structural coma
    - pupils, extraocular movements, and motor findings, if present, are usually asymmetric
    - look for focal or lateralizing abnormalities
  - Toxic/Metabolic
    - Major organ failure
    - Electrolyte/Endocrine
    - Toxins/Temperature
    - Acid disorders
    - Base disorders
    - decreased Oxygen level
    - Lactate
    - Insulin/Infection (sepsis)
    - Cardiac/hyperCalcemia
  - Primary CNS disease/trauma
    - Bilateral cerebral hemispheres (affecting cognition)
    - Brainstem (affecting reticular activating system)
    - Compression
      - Supra/infratentorial tumour
      - Sub/epidural hematoma
  - Direct
    - Brainstem infarct or hemorrhage

In general, intubate if GCS <8; but ability to protect airway is primary consideration
• toxic-metabolic coma
  • dysfunction at lower levels of the brainstem (e.g. caloric unresponsiveness)
  • respiratory depression in association with an intact upper brainstem (e.g. equal and reactive pupils; see exceptions in Table 13)
  • extraocular movements and motor findings are symmetric or absent
• essential to re-examine frequently because status can change rapidly
• diagnosis may become apparent only with the passage of time
  • delayed deficit after head trauma suggestive of epidural hematoma (characteristic “lucid interval”)

Disposition
• admission: if ongoing decreased LOC, admit to service based on tentative diagnosis, or transfer patient if appropriate level of care not available
• discharge: readily reversible alteration of LOC; ensure adequate follow-up care available

History and Physical Exam
• OPQRST, previous episodes and change in pattern
• cardiac risk factors (HTN, DM, dyslipidemia, smoking, FHx)
• vitals, cardiac, respiratory, peripheral vascular, abdominal exams

Investigations
• CBC, electrolytes, Cr, BUN, glucose, PTT/INR
• ECG: always compare with previous; may be normal in up to 50% of PE and acute MI
• CXR: compare with previous

Management and Disposition
• ABCs, O₂, cardiac monitors, IV access
• treat underlying cause and involve consultants as necessary
• consider further observation/monitoring if unclear diagnosis or risk of dysrhythmia
• discharge: patients with a low probability of life-threatening illness due to resolving symptoms and negative workup; arrange follow-up and instruct to return if SOB or increased chest pain develops

Life-Threatening Causes of Chest Pain
PET MAP
P E Sophageal rupture
T amponade
M I/angina
Aortic dissection
Pneumothorax

Angina Characteristics
1. Retrosternal location
2. Provoked by exertion
3. Relieved by rest or nitroglycerin

Risk for CAD
3/3 = “typical angina” - high risk
2/3 = intermediate risk for women >50 yr, all men
1/3 = Intermediate risk in men >40 yr, women >60 yr

Imaging is necessary for all suspected aortic dissections, regardless of BP

### Headache

- see Neurology, N45

#### Etiology

**the common**
- common migraine (without aura)/classic migraine (with aura)
  - common: unilateral, throbbing, aggravated by activity, moderate/severe, N/V, photo-/phonophobia
  - classic: varied aura symptoms, e.g. lights in vision, pins and needles, loss of vision, dysarthria
  - abortive treatment: fluids, NSAIDs, antiemetics, antiepileptic drugs, vasoactive medications
  - family doctor to consider prophylactic treatment
- tension/muscular headache
  - mild-moderate headache with gradual onset lasting minutes to days
  - bilateral-frontal or nuchal-occipital
  - increased with stress, sleep deprivation
  - treatment: modify stressor(s), local measures, NSAIDs, tricyclic antidepressants

**the deadly**
- subarachnoid hemorrhage (SAH) (see Neurosurgery, NS18)
  - sudden onset, “worst headache of life” maximum intensity within minutes
  - increased pain with exertion, N/V, meningeval signs
  - diagnosis
    - new generation CT 100% sensitive if read by neuroradiologist within 6h of onset
    - LP if suspected SAH and normal CT after 6h
  - management: urgent neurosurgery consult
  - increased ICP
    - worse in morning, when supine or bending down, with cough or Valsalva
    - physical exam: neurological deficits, cranial nerve palsies, papilledema
• diagnosis: CT head  
• meningitis (see Infectious Diseases, ID18)  
• flu-like symptoms (fever, N/V, malaise), meningeal signs, petechial rash  
• altered LOC and confusion  
• rule out increased ICP; if CT head or normal mental status, no neurological signs and no papilledema, then do LP for diagnosis  
• treatment: early empiric antibiotics ± acyclovir, steroid therapy  
• temporal arteritis (causes significant morbidity, blindness) (see Ophthalmology, OP38)  
• unilateral scalp tenderness, jaw claudication, visual disturbances  
• temporal artery biopsy is gold standard for diagnosis  
• associated with polymyalgia rheumatica  
• treatment: high-dose steroids immediately if suspected

Disposition  
• admission: if underlying diagnosis is critical or emergent, if there are abnormal neurological findings, if patient is elderly or immunocompromised (atypical presentation), or if pain is refractory to oral medications  
• discharge: assess for risk of narcotic misuse; most patients can be discharged with appropriate analgesia and follow-up with their family physician; instruct patients to return for fever, vomiting, neurologic changes, or increasing pain

Joint and Back Pain

JOINT PAIN (see Rheumatology, RH3)  
• rule out life threatening causes: septic joint (see Orthopedics, OR10)

History and Physical Exam  
• associated symptoms: fever, constitutional symptoms, skin lesions, conjunctivitis, urethritis  
• patterns of joint involvement: polyarticular vs. monoarticular, symmetric vs. asymmetric  
• inflammatory symptoms: prolonged morning stiffness; stiffness and pain ease through the day, midday fatigue, soft tissue swelling  
• non-inflammatory symptoms: stiffness short lived after inactivity, short duration stiffness in the morning, pain increases with activity  
• assess ROM, presence of joint effusion, warmth  
• assess for localized joint pain, erythema, warmth, swelling with pain on active ROM, inability to bear weight, fever; may indicate presence of septic joint

Investigations  
• blood work: CBC, ESR, CRP, WBC, INR/PTT, blood cultures, urate  
• joint x-ray ± contralateral joint for comparison  
• bedside U/S to identify effusion  
• joint aspirate send for: WBC, protein, glucose, Gram stain, crystals

Management  
• septic joint: IV antibiotics ± joint decompression and drainage  
• antibiotics can be started empirically if septic arthritis cannot be ruled out  
• crystalline synovitis: NSAIDs at high dose, colchicine within first 24 h, corticosteroids  
• do not use allopurinol, as it may worsen acute attack  
• acute polyarthritis: NSAIDs, analgesics (acetylsalicylic ± opioids), local or systemic corticosteroids  
• osteoarthritis: NSAIDs, acetylsalicylic  
• soft tissue pain: allow healing with enforced rest ± immobilization  
• non-pharmacologic treatment: local heat or cold, electrical stimulation, massage  
• pharmacologic: oral analgesics, NSAIDs, muscle relaxants, corticosteroid injections, topical agents

BACK PAIN (see Family Medicine, FM40)  
• rule out vascular emergencies: aortic dissection, AAA, PE, MI, retroperitoneal bleed  
• rule out spinal emergencies using red flags (see sidebar): osteomyelitis, cauda equina, epidual abscess or hematoma  
• evaluate risk for fracture (osteoporosis, age), infection (IV drug user, recent spinal intervention, immunosuppression), cancer, vascular causes (cardiac risk factors)  
• typical benign back pain is moderate, dull, aching, worse with movement or cough  
• palpate spine for bony tenderness; precordial, respiratory, abdominal and neurological exams guided by history  
• reserve imaging for suspicion of emergencies, metastases, and patients at high risk of fracture, infection, cancer, or vascular causes

CT Head within 6 h is 100% Sensitive for Diagnosis of Subarachnoid Hemorrhage (SAH)  
BMJ 2008;336(7657):1359 A meta-analysis of 7 RCTs examined the effectiveness of parenteral corticosteroids use after administration of standard abortive therapy. The primary outcome was recurrence of migraine within 72 hours of treatment. All trials compared single-dose parenteral dexamethasone with placebo. Results showed dexamethasone and placebo provided similar acute pain reduction (weighted mean difference 0.37, 95% CI 0.2-0.5, I²=0). Dexamethasone was, however, more effective than placebo in reducing recurrence rates (RR 0.34, 95% CI 0.2-0.5). Conclusions: when added to standard abortive therapy for migraine headaches, single dose of parenteral dexamethasone is associated with 26% RR in recurrent headaches (NNT=9).

Which Patients can Safely Undergo Lumbar Puncture Without Screening CT?  
Arch Intern Med 1999;159(22):2681-2685  
Study: a prospective study to identify patients who can safely undergo LP without CT.  
Population: 113 patients, age > 18 yd, needing urgent LP as determined by ED physicians.  
Intervention: all patients were examined before CT by staff physicians. Physician examiners involved in the study then recorded the presence or absence of 10 clinical findings and answered 8 questions regarding the patient’s past medical history and recorded their perceived likelihood that LP would be contraindicated.  
Main outcome measure: results of non-contrast CTs interpreted by staff radiologist.  
Results: 2.7% of patients had lesions on CT that contraindicated LP. Overall, clinical impression had the highest predictive value in identifying patients with contraindications to LP (1+16.8). When used in aggregate—altering mental status, focal neurological examination and papilledema were three statistically significant identified predictors of new intracranial lesion-related LP (1). When used alone these predictors were inadequate.  
Conclusion: given the low prevalence of lesions that contraindicate LP, screening CT solely to establish the safety of LP provides minimal extra information. Physicians can rely on their clinical judgement and the three predictors.

Meningitis  
• Do not delay IV antibiotics for LP  
• Deliver first dose of dexamethasone with or before first dose of antibiotic therapy

Parenteral Dexamethasone for Preventing Recurrence of Acute Severe Migraine Headache  
BMC 2003;316(9757):1359  
A meta-analysis of 1 RCTs examined the effectiveness of parenteral corticosteroids use after administration of standard abortive therapy. The primary outcome was recurrence of migraine within 72 hours of treatment. All trials compared single-dose parenteral dexamethasone with placebo. Results showed dexamethasone and placebo provided similar acute pain reduction (weighted mean difference 0.37, 95% CI 0.2-0.5, I²=0). Dexamethasone was, however, more effective than placebo in reducing recurrence rates (RR 0.34, 95% CI 0.2-0.5). Conclusions: when added to standard abortive therapy for migraine headaches, single dose of parenteral dexamethasone is associated with 26% RR in recurrent headaches (NNT=9).

CT Head within 6 h is 100% Sensitive for Diagnosis of Subarachnoid Hemorrhage (SAH)  
BMJ 2012;346:e140717  
Study: a prospective multicentre cohort study was conducted in 11 tertiary care emergency departments across Canada to measure the sensitivity of CT head in the evaluation of ED patients for SAH.  
Population: neurologically intact adults who presented with new onset non-traumatic headache reaching maximum intensity in less than one hour while head CT as part of their diagnostic workup to rule out SAH.  
Design: patients were deemed positive for SAH if they had subarachnoid blood on CT or xanthochromia in the CSF or red blood cells in the final tube of CSF collected. Some patients with normal results on CT received LP at the discretion of the treating physician. Unless patients had a negative result on LP or a definitive cause for the headache identified through neuroimaging patients were followed for six months to ascertain their outcome.  
Main Outcome Measures: Results of CT interpreted by staff radiologist.  
Results: Overall sensitivity of CT for detecting subarachnoid hemorrhage was 92.9%, specificity 100%. Subgroup analysis revealed 100% sensitivity for patients scanned within 6 h of headache onset.  
Conclusion: CT is extremely sensitive in identifying subarachnoid hemorrhage when it is carried out within 6 h of headache onset.

Parenteral Dexamethasone for Preventing Recurrence of Acute Severe Migraine Headache  
BMC 2003;316(9757):1359  
A meta-analysis of 1 RCTs examined the effectiveness of parenteral corticosteroids use after administration of standard abortive therapy. The primary outcome was recurrence of migraine within 72 hours of treatment. All trials compared single-dose parenteral dexamethasone with placebo. Results showed dexamethasone and placebo provided similar acute pain reduction (weighted mean difference 0.37, 95% CI 0.2-0.5, I²=0). Dexamethasone was, however, more effective than placebo in reducing recurrence rates (RR 0.34, 95% CI 0.2-0.5). Conclusions: when added to standard abortive therapy for migraine headaches, single dose of parenteral dexamethasone is associated with 26% RR in recurrent headaches (NNT=9).

CT Head within 6 h is 100% Sensitive for Diagnosis of Subarachnoid Hemorrhage (SAH)  
BMJ 2012;346:e140717  
Study: a prospective multicentre cohort study was conducted in 11 tertiary care emergency departments across Canada to measure the sensitivity of CT head in the evaluation of ED patients for SAH.

Parenteral Dexamethasone for Preventing Recurrence of Acute Severe Migraine Headache  
BMC 2003;316(9757):1359  
A meta-analysis of 1 RCTs examined the effectiveness of parenteral corticosteroids use after administration of standard abortive therapy. The primary outcome was recurrence of migraine within 72 hours of treatment. All trials compared single-dose parenteral dexamethasone with placebo. Results showed dexamethasone and placebo provided similar acute pain reduction (weighted mean difference 0.37, 95% CI 0.2-0.5, I²=0). Dexamethasone was, however, more effective than placebo in reducing recurrence rates (RR 0.34, 95% CI 0.2-0.5). Conclusions: when added to standard abortive therapy for migraine headaches, single dose of parenteral dexamethasone is associated with 26% RR in recurrent headaches (NNT=9).
**Seizures**

- see Neurology: N18

**Definition**
- paroxysmal alteration of behaviour and/or EEG changes resulting from abnormal, excessive activity of neurons
- status epilepticus: continuous or intermittent seizure activity for greater than 5 min without regaining consciousness

**Categories**
- generalized seizure (consciousness always lost): tonic/clonic, absence, myoclonic, atonic
- partial seizure (focal): simple partial, complex partial
- causes: primary seizure disorder, structural (trauma, intracranial hemorrhage, infection, increased ICP), metabolic disturbance (hippo-/hyperglycemia, hippo-/hypernatremia, hypocalcemia, hypomagnesemia, toxins/drugs)
- differential diagnosis: syncope, pseudoseizures, migraines, movement disorders, narcolepsy/cataplexy, myoclonus

**History**
- from patient and bystander: flaccid and unconscious, often with deep rapid breathing
- preceding aura, rapid onset, loss of bladder/bowel control, tongue-biting (sides of the tongue)
- length of seizure and post-ictal symptoms

**Physical Exam**
- injuries to head and spine and bony prominences (e.g. elbows), tongue laceration, aspiration, urinary incontinence

**Table 17. Concurrent Investigation and Management of Status Epileptics**

<table>
<thead>
<tr>
<th>Timing</th>
<th>Steps</th>
</tr>
</thead>
<tbody>
<tr>
<td>Immediate</td>
<td>Protect airway with positioning; intubate if airway compromised or elevated ICP&lt;br&gt;Monitor: vital signs, ECG, oximetry; bedside blood glucose&lt;br&gt;Establish IV access&lt;br&gt;Benzodiazepine - IV lorazepam 0.1 mg/kg up to 4 mg/dose at 2 mg/min preferred over IV diazepam 0.15 mg/kg up to 10 mg/dose at 5 mg/min; repeat at 5 min if ineffective&lt;br&gt;Fluid resuscitation: Give 50 mL 50% glucose (preceded by thiamine 100 mg IM in adults)&lt;br&gt;Obtain blood samples for glucose, CBC, electrolytes, Ca⁺², Mg⁺², toxins, and antiepileptic drug levels; consider prolactin, β-hCG&lt;br&gt;Vasopressor support if sBP &lt; 90 or MAP &lt; 70 mmHg</td>
</tr>
<tr>
<td>Urgent</td>
<td>Establish second IV line, urinary catheter&lt;br&gt; If status persists, phenytoin 20 mg/kg IV at 25-50 mg/min in adults; may give additional 10 mg/kg IV 10 minutes after loading infusion&lt;br&gt; If seizure resolves, antiepileptic drug still required to prevent recurrence&lt;br&gt; EEG monitoring to evaluate for non-convulsive status epilepticus</td>
</tr>
<tr>
<td>Refractory</td>
<td>If status persists after maximum doses above, consult ICU and start one or more of: Phenytoin 20 mg/kg IV at 50 mg/min&lt;br&gt; Midazolam 0.2 mg/kg IV loading dose and 0.05-0.5 mg/kg/h&lt;br&gt; Propofol 2-5 mg/kg IV loading dose then 2-10 mg/kg/h</td>
</tr>
<tr>
<td>Post-Seizure</td>
<td>Investigate underlying cause: consider CT, LP, MRI, intracranial pressure monitoring</td>
</tr>
</tbody>
</table>

Note: All interventions should be done as soon as possible
Adapted from Brophy et al. Guidelines for the Evaluation and Management of Status Epilepticus. Neurocrit Care 2012;17:3-23

**Disposition**
- decision to admit or discharge should be based on the underlying disease process identified
  - if a patient has returned to baseline function and is neurologically intact, then consider discharge with outpatient follow-up
  - first-time seizure patients being discharged should be referred to a neurologist for follow-up
  - admitted patients should generally have a neurology consult
  - patient should not drive until medically cleared (local regulations vary)
  - complete notification form to appropriate authority regarding ability to drive
  - warn regarding other safety concerns (e.g. no swimming, bathing children alone, etc.)
Shortness of Breath

- see Respirology, R3 and Cardiology and Cardiac Surgery, C5

**History and Physical Exam**

- acute SOB is often due to a relatively limited number of conditions; associated symptoms and signs are key to the appropriate diagnosis
  - substernal chest pain with cardiac ischemia
  - fever, cough, and sputum with respiratory infections
  - urticaria with anaphylaxis
  - wheezing with acute bronchospasm
  - environmental or occupational exposures
- dyspnea may be the sole complaint and the physical exam may reveal few abnormalities (e.g. PE, pneumothorax)
- vitals including pulse oximetry
  - wheeze (airway) vs. crackles (parenchymal), JVP, and murmurs

**Investigations**

- blood work
  - CBC and differential (hematocrit to exclude anemia), electrolytes, consider VBG
  - serial cardiac enzymes and ECG if considering cardiac source
  - Wells scores to consider appropriateness of d-dimer
- imaging
  - CXR (hyperinflation and bullous disease suggestive of obstructive lung disease, or changes in interstitial markings consistent with inflammation, infection, or interstitial fluid)
  - CT chest usually is not indicated in the initial evaluation of patients with dyspnea, but can be valuable in patients with interstitial lung disease, occult emphysema, or chronic thromboembolic disease (i.e. PE)

**Management of Life-Threatening Dyspnea NYD**

- see Primary and Secondary Surveys, ER2, ER5
- treat underlying cause

**Disposition**

- the history and physical exam lead to accurate diagnoses in patients with dyspnea in approximately two-thirds of cases; the decision to admit or discharge should be based on the underlying disease process identified
  - consider intubation in CO₂ retainers (e.g. COPD)
- if discharging, organize follow-up and educate regarding signs to return to hospital

---

**Syncope**

**Definition**

- sudden, transient loss of consciousness and postural tone with spontaneous recovery
- usually caused by generalized cerebral or reticular activating system hypoperfusion

**Etiology**

- cardiogenic: dysrhythmia, outflow obstruction (e.g. PE, pulmonary HTN), MI, valvular disease
- non-cardiogenic: peripheral vascular (hypovolemia), vasovagal, cerebrovascular disorders, CNS, metabolic disturbances (e.g. EtOH intoxication)
History
- gather details from witnesses, and clarify patient's experience (e.g. dizziness, ataxia, or true syncope)
  - two key historical features: prodrome and situation
- distinguish between syncope and seizure (see Neurology, N19)
  - some patients may have myoclonic jerks with syncope – NOT a seizure
  - signs and symptoms during presyncope, syncope, and postsyncope
  - past medical history, drugs
  - think anatomically in differential; pump (heart), blood, vessels, brain
- syncope is cardiogenic until proven otherwise if
  - there is sudden loss of consciousness with no warning or prodrome
  - syncope is accompanied by chest pain

Physical Exam
- postural BP and HR
- cardiovascular, respiratory, and neurological exam
- examine for signs of trauma caused by syncopal episode

Investigations
- ECG (tachycardia, bradycardia, blocks, Wolff-Parkinson White, long QT interval), bedside glucose
- blood work: CBC, electrolytes, BUN/Cr, ABGs, troponin, Ca²⁺, Mg²⁺, β-hCG
- consider toxicology screen

Management
- ABCs, IV, O₂, monitor
- cardiogenic syncope: admit to medicine/cardiology
- low risk syncope: discharge with follow-up as indicated by cause (non-cardiogenic syncope may still be admitted)

Disposition
- decision to admit is based on etiology
- most patients will be discharged
- on discharge, instruct patient to follow up with family physician
  - educate about avoiding orthostatic or situational syncope
  - evaluate the patient for fitness to drive or work
- patients with recurrent syncope should avoid high-risk activities (e.g. driving)

Sexual Assault

Epidemiology
- 1 in 4 women and 1 in 10 men will be sexually assaulted in their lifetime; only 7% are reported

General Approach
- ABCs, treat acute, serious injuries; physician priority is to treat medical issues and provide clearance
- ensure patient is not left alone and provide ongoing emotional support
- obtain consent for medical exam and treatment, collection of evidence, disclosure to police (notify police as soon as consent obtained)
- Sexual Assault Kit (document injuries, collect evidence) if <72 h since assault
- label samples immediately and pass directly to police
- offer community crisis resources (e.g. shelter, hotline)
- do not report unless victim requests or if <16 yr old (legally required)

History
- ensure privacy for the patient – others should be asked to leave
- questions to ask: who, when, where did penetration occur, what happened, any weapons, or physical assault?
- post-assault activities (urination, defecation, change of clothes, shower, douche, etc.)
- gynecologic history
  - gravidity, parity, last menstrual period
  - contraception use
- last voluntary intercourse (sperm motile 6-12 h in vagina, 5 d in cervix)
- medical history: acute injury/illness, chronic diseases, psychiatric history, medications, allergies, etc.
Physical Exam
- never re-traumatize a patient with the examination
- general examination
  - mental status
  - sexual maturity
  - patient should remove clothes and place in paper bag
  - document abrasions, bruises, lacerations, torn frenulum/broken teeth (indicates oral penetration)
- pelvic exam and specimen collection
  - ideally before urination or defecation
  - examine for seminal stains, hymen, signs of trauma
  - collect moistened swabs of dried seminal stains
  - pubic hair combings and cuttings
  - speculum exam
    - lubricate with water only
    - vaginal lacerations, foreign bodies
    - Pap smear, oral/cervical/rectal culture for gonorrhea and chlamydia
    - posterior fornix secretions if present or aspiration of saline irrigation
    - immediate wet smear for motile sperm
    - air-dried slides for immotile sperm, acid phosphatase, ABO group
  - fingernail scrapings and saliva sample from victim

Investigations
- VDRL: repeat in 3 mo if negative
- serum β-hCG
- blood for ABO group, Rh type, baseline serology (e.g. hepatitis, HIV)

Management
- involve local/regional sexual assault team
- medical
  - suture lacerations, tetanus prophylaxis
  - gynecology consult for foreign body, complex lacerations
  - assumed positive for gonorrhea and chlamydia
    - management: azithromycin 1 g PO x 1 dose (alt: doxycycline 100 mg PO bid x 7 d) and cefixime 800 mg PO x 1 dose (alt: ceftriaxone 1 g IM x 1 dose)
  - may start prophylaxis for hepatitis B and HIV
  - pre and post counselling for HIV testing
  - pregnancy prophylaxis offered
    - levonorgestrel 0.75 mg PO STAT, repeat within 12 h (Plan B+)
  - psychological
    - high incidence of psychological sequelae
    - have victim change and shower after exam completed

Disposition
- discharge if injuries/social situation permit
- follow-up with physician in rape crisis centre within 24 h
- best if patient does not leave ED alone

DOMESTIC VIOLENCE
- women are usually the victims, but male victimization also occurs
- identify the problem (need high index of suspicion)
  - suggestive injuries (bruises, sprains, abrasions, occasionally fractures, burns, or other injuries; often inconsistent with history provided)
  - somatic symptoms (chronic and vague complaints)
  - psychosocial symptoms
  - clinician impression (your ‘gut feeling’, e.g. overbearing partner that won’t leave patient’s side)
- if disclosed, be supportive and assess danger
  - patient must consent to follow-up investigation/reporting (unless for children)

Management
- treat injuries and document findings
- ask about sexual assault and children at home (encourage notification of police)
- safety plan with good follow-up with family doctor/social worker

Risk of Sexually Transmitted Disease after Sexual Assault
- Gonorrhea: 6-18%
- Chlamydia: 4-17%
- Syphilis: 0.5-3%
- HIV: <1%
Medical Emergencies

Anaphylaxis and Allergic Reactions

Etiology
- Anaphylaxis is an exaggerated immune-mediated hypersensitivity reaction that leads to systemic histamine release, increased vascular permeability, and vasodilation; regardless of the etiology, the presentation and management of anaphylactic reactions are the same
  - Allergic (re-exposure to allergen)
  - Non-allergic (e.g. exercise-induced)

Diagnostic Criteria
- Anaphylaxis is highly likely with any of
  1. Acute onset of an illness (min to hrs) with involvement of the skin, mucosal tissue and at least one of
     - Respiratory compromise (e.g. dyspnea, wheeze, stridor, hypoxemia)
     - Hypotension/end-organ dysfunction (e.g. hypotonia, collapse, syncope, incontinence)
  2. Two or more of the following after exposure to a LIKELY allergen for that patient (min to hrs)
     - Involvement of the skin-mucosal tissue
     - Respiratory compromise
     - Hypotension or associated symptoms
     - Persistent gastrointestinal symptoms (e.g. crampy abdominal pain, vomiting)
  3. Hypotension after exposure to a KNOWN allergen for that patient (min to hrs)
     - Management is also appropriate in cases which do not fulfill criteria, but who have had previous episodes of anaphylaxis
     - Life-threatening differentials for anaphylaxis include asthma and septic shock
     - Angioedema may mimic anaphylaxis but tends not to improve with standard anaphylaxis treatment

Management
1. Immediate initial management (call for help and perform concurrently)
   - Give 0.3-0.5 mL of 1:1,000 epinephrine IM to lateral thigh, may repeat q5-15min
   - If ABCs compromised or LOC, manage and consult ICU immediately
   - O2
   - Give bolus 1 L crystalloid IV (IO if necessary); Trendelenberg position
   - Have continuous pulse oximetry and telemetry; frequent BP monitoring
   - Remove causative agent if possible
2. Secondary treatment
   - Diphenhydramine (Benadryl®) 50 mg IM or IV q4-6h
   - Ranitidine 50 mg IV
   - Methylprednisolone 125 mg IV (dose depending on severity)
   - Salbutamol (Ventolin®) via nebulizer if bronchospasm

Disposition
- Monitor for 4-6 h in ED (minimum) and arrange follow-up with family physician in 24-48 h
- Can have second phase (biphasic) reaction up to 48 h later, patient may need to be supervised
- Educate patient on avoidance of allergens
- Medications
  - H1 antagonist (cetirizine 10 mg PO OD or Benadryl® 50 mg PO q4-6h x3d)
  - H2 antagonist (ranitidine 150 mg PO OD x3d)
  - Corticosteroid (prednisone 50 mg PO OD) x5d to prevent secondary reaction

Asthma
- See Respiriology, R7
- Chronic inflammatory airway disease with episodes of bronchospasm and inflammation resulting in reversible airflow obstruction

History and Physical
- Find cause of asthma exacerbation (viral, environmental, etc.)
- History of asthma control; severity of exacerbations (ICU, intubation history)
- Signs of respiratory distress
- Vitals, specifically O2

Investigations
- Peak flow meter
- ± ABG if in severe respiratory distress
- CXR if diagnosis in doubt to rule out pneumonia, pneumothorax, etc.

</tbody>
</table>

Disposition
- β-agonist MDI with aerochamber 2-4 puffs q2-4h until symptoms controlled, then prn
- inhaled corticosteroids with aerochamber if not already prescribed
- prednisone 30-60 mg/d for 7 d with no taper
- counsel on medication adherence and educate on use of aerochamber
- follow-up with primary care physician

Cardiac Dysrhythmias

- see Cardiology and Cardiac Surgery, C17

Bradydysrhythmias and AV Conduction Blocks
- AV conduction blocks
  - 1st degree: prolonged PR interval (>200 msec), no treatment required
  - 2nd degree
    - Mobitz I: gradual prolongation of PR interval then dropped QRS complex, usually benign
    - Mobitz II: PR interval constant with dropped QRS complex, can progress to 3rd degree AV block
  - 3rd degree: P wave unrelated to QRS complex, PP and RR intervals constant
    - atropine and transcutaneous pacemaker (atropine with caution)
    - if transcutaneous pacemaker fails consider dopamine, epinephrine IV
  - long-term treatment for Mobitz II and 3rd degree block – internal pacemaker
- sinus bradycardia (rate <60 bpm)
  - can be normal (especially in athletes)
  - causes: vagal stimulation, vomiting, myocardial infarction/ischemia, increased ICP, sick sinus node, hypothyroidism, drugs (e.g. β-blockers, CCBs)
  - treat if symptomatic (hypotension, chest pain)
    - acute: atropine ± transcutaneous pacing
    - sick sinus: transcutaneous pacing
    - drug induced: discontinue/reduce offending drug, consider antidotes

Supraventricular Tachydysrhythmias (narrow QRS)
- sinus tachycardia (rate >100 bpm)
  - causes: increased sympathetic tone, drugs, fever, hypotension, anemia, thyrotoxicosis, MI, PE, emotional, pain, etc.
  - search for and treat underlying cause, consider β-blocker if symptomatic
- regular rhythm (i.e. not sinus tachycardia)
  - vagal maneuvers (carotid massage, Valsalva), adenosine 6 mg IV push, if no conversion give 12 mg, can repeat 12 mg dose once
  - rhythm converts: probable re-entry tachycardia (AVNRT more common than AVRT)
    - monitor for recurrence
    - treat recurrence with adenosine or longer acting medications
  - rhythm does not convert: atrial flutter, ectopic atrial tachycardia, junctional tachycardia
    - rate control (diltiazem, β-blockers) and consult cardiology
- irregular rhythm
  - probable AFib, atrial flutter, or multifocal atrial tachycardia
  - rate control (diltiazem, β-blockers)
Atrial Fibrillation
• most common sustained dysrhythmia; no organized P waves (atrial rate >300/min), irregularly irregular heart rate, narrow QRS (typically)
• etiology: HTN, CAD, thyrotoxicosis, EtOH (holiday heart), valvular disease, pericarditis, cardiomyopathy, sick sinus syndrome
• treatment principles: stroke prevention, treat symptoms, identify/treat underlying cause
• decreases cardiac output by 20-30% (due to loss of organized atrial contractions)
• acute management
  • if unstable: immediate synchronized cardioversion
  • if onset of AFib is >48 h: rate control, anticoagulate 3 wk prior to and 4 wk after cardioversion, or do transesophageal echocardiogram to rule out clot
  • if onset <48 h or already anticoagulated: may cardiovert
• electrical cardioversion: synchronized direct current (DC) cardioversion
• chemical cardioversion: procainamide, flecainide, propafenone
• long-term management: rate or rhythm control, consider anticoagulation (CHADS2 score, see Cardiology and Cardiac Surgery, C20)

Ventricular Tachydysrhythmias (wide QRS)
• VTach (rate usually 140-200 bpm)
  • definition: 3 or more consecutive ventricular beats at >100 bpm
  • etiology: CAD with MI is most common cause
  • treatment: sustained VTach (>30 s) is an emergency
    • hemodynamic compromise: synchronized DC cardioversion
    • no hemodynamic compromise: synchronized DC cardioversion, amiodarone, procainamide
  • VFib: call a code blue, follow ACLS for pulseless arrest
  • Torsades de pointes
    • looks like VTach but QRS ‘rotates around baseline’ with changing axis and amplitude (twisted ribbon)
    • etiology: prolonged QT due to drugs (e.g. quinidine, TCAs, erythromycin, quinolones), electrolyte imbalance (hypokalemia, hypomagnesemia), congenital
    • treatment
      • IV Mg2+, temporary overdrive pacing, isoproterenol
      • correct cause of prolonged QT

Chronic Obstructive Pulmonary Disease
• see Respirology, R9
• progressive development of irreversible airway obstruction, typically caused by smoking

History and Physical Exam
• acute exacerbation: episode of increased dyspnea, coughing, increase in sputum volume or purulence
• triggers: virus, pneumonia, urinary tract infection, PE, CHF, MI, drugs
• characterize previous episodes and hospitalizations, smoking history
• vital signs, level of consciousness, signs of respiratory distress, respiratory exam

Investigations
• CBC, electrolytes, ABG, CXR, ECG, PFTs

Management
• keep O2 sat 88-92% (be aware when giving O2 to chronic hypercapnic/CO2 retainers but do not withhold O2, if hypoxic)
• apply BiPAP if severe distress, arterial pH <7.35, or hypercapnic
• ipratropium is anticholinergic agent of choice, add salbutamol
• steroids: prednisolone 40 mg PO for 7-10 d
• antibiotics: TMP-SMX, cephalosporins, respiratory quinolones (if acute change in frequency, quantity, and colour of sputum production)
• if life-threatening, ICU admission for ventilation (chance of ventilation dependency)
• lower threshold to admit if comorbid illness

Disposition
• no guidelines for admission - based on clinical judgement and comorbidities
• if discharging, use antibiotics, tapering steroids, up to 4-6 puffs qid of ipratropium and salbutamol and organize follow-up
### Congestive Heart Failure

- see Cardiology and Cardiac Surgery, C36

#### Etiology
- decreased myocardial contractility: ischemia, infarction, cardiomyopathy, myocarditis
- pressure overload states: HTN, valve abnormalities, congenital heart disease
- restricted cardiac output: myocardial infiltrative disease, cardiac tamponade
- volume overload

#### Presentation
- left-sided heart failure
- dyspnea, decreased exercise tolerance, paroxysmal nocturnal dyspnea, orthopnea, nocturia, fatigue, possibly altered mental status, syncope, angina, systemic hypotension
- hypoxia, decreased air entry to lungs, rales, S3 or S4, pulmonary edema (on CXR), pleural effusion (usually right-sided)
- right-sided heart failure
- dependent bilateral pitting edema, JVP elevation, hepatic enlargement, ascites
- patients often present with a combination of right-sided and left-sided symptoms

#### Investigations
- blood work: CBC, electrolytes, AST, ALT, bilirubin, Cr, BUN, cardiac enzymes, brain natriuretic peptide
- CXR (see sidebar)
- ECG: look for MI, ischemia (ST elevation/depression, T-wave inversion)
- in CHF: LVH, atrial enlargement, conduction abnormalities
- ABG: if severe or refractory to treatment
- hypoxemia, hypercapnia and acidosis are signs of severe CHF
- echocardiogram: not usually used in emergency evaluation, previous results may aid in diagnosis
- may be precipitated by dysrhythmia (e.g. sudden onset AFib) – correct if new
- rule out serious differentials such as PE, pneumothorax, pneumonia/empyema, COPD exacerbation

#### Management (Acute)
- ABC, may require intubation if severe hypoxia
- sit upright, cardiac monitoring, and continuous pulse oximetry
- saline lock IV, Foley catheter (to follow effectiveness of diuresis)
- 100% O2 by mask
  - if poor response, may require BiPAP or intubation
- drugs
  - nitroglycerin 0.3 mg SL q5min prn ± topical nitroglycerine patch (0.2-0.8 mg/h)
  - if not responding or ischemia: 10-200 µg/min IV, titrate
  - diuretic if volume overloaded (e.g. furosemide 40-80 mg IV), use caution if cause is valvulopathy
  - morphine 1-2 mg IV prn
  - if hypotensive: dobutamine (2.5 µg/kg/min IV) or dopamine (5-10 µg/kg/min IV), titrate up to sBP 90-100 mmHg
  - ASA 160 mg chew and swallow
- treat precipitating factor
- cardiology or medicine consult

### Deep Vein Thrombosis and Pulmonary Embolism

- see Respiratory, R18

#### Risk Factors
- Virchow’s triad: alterations in blood flow (venous stasis), injury to endothelium, hypercoagulable state (including pregnancy, use of OCP, malignancy)
- clinical risk factors (see sidebar)

#### Presentation
- DVT: calf pain, leg swelling/erythema/edema, palpable cord on exam; can be asymptomatic
- PE: dyspnea, pleuritic chest pain, hemoptyis, tachypnea, cyanosis, hypoxia, fever
- clinical signs/symptoms are unreliable for diagnosis and exclusion of DVT/PE; investigation often needed
- calculate the PERC (PE rule out criteria) score to assess the need for PE workup before assessing the likelihood of a PE (Wells’ Criteria)
Investigations
• PERC score alone can rule out PE unless patient is pregnant
• Use Wells’ criteria for DVT and PE to guide investigations (Figures 12-14)
• ECG and CXR are useful to look for other causes (e.g. ACS, pneumonia)
• D-dimer is only useful if it is negative in low risk patients (highly sensitive)
• U/S has high sensitivity and specificity for proximal clot but only 73% sensitivity for DVT below the knee (may need to repeat in 1 wk)
• CT angiography has high sensitivity and specificity for PE, may also suggest other etiology
• V/Q scan useful in pregnancy, when CT angiography not available, or IV contrast contraindicated

Management of DVT/PE
• LMWH unless patient also has renal failure
  ▪ dalteparin 200 IU/kg SC q24h or enoxaparin 1.5 mg/kg SC q24h
  ▪ warfarin started at same time as LMWH (5 mg PO OD initially)
  ▪ LMWH discontinued when INR has been therapeutic (2-3) for 2 consecutive days
  ▪ early ambulation with analgesia is safe if appropriately anticoagulated
  ▪ rivaroxaban can be used in both acute management of symptomatic DVT or PE and extended treatment
  ▪ 15 mg PO bid for first 21 d; 20 mg PO daily for remaining treatment (taken with food at approximately the same time each day)
  ▪ IVC filter or surgical thrombectomy considered if anticoagulation is contraindicated
  ▪ often can be treated as outpatient, may require analgesia for chest pain (narcotic or NSAID)
  ▪ admit if hemodynamically unstable, require supplemental O2, major comorbidities, lack of sufficient social supports, unable to ambulate, need invasive therapy
  ▪ referral to medicine for coagulopathy and malignancy workup
  ▪ long-term anticoagulation
    ▪ if reversible risk factor: 3-6 mo of warfarin
    ▪ idiopathic VTE: may need longer term warfarin (5 yr or more)

Figure 12. Approach to suspected DVT

Figure 13. Approach to suspected PE
Diabetic Emergencies

- see Endocrinology, E11

**Diabetic Ketoacidosis**
- severe insulin deficiency resulting in hyperglycemia (11-55 mmol/L), dehydration, and electrolyte abnormalities
- history and physical exam – often young, type 1 DM, may be first presentation of undiagnosed DM (may occur in small percentage of type 2 DM patients)
  - early symptoms: polyuria, polydipsia, malaise, nocturia, weight loss
  - late signs and symptoms
    - anorexia, nausea, vomiting, dyspnea (often due to acidosis), fatigue
    - abdominal pain
    - drowsiness, stupor, coma
    - Kussmaul’s respiration
    - fruity acetone breath
- investigations
  - CBC, glucose, electrolytes, BUN/Cr, Ca²⁺, Mg²⁺, PO₄³⁻, urine glucose and ketones
  - ABG
  - ECG (MI possible precipitant; electrolyte disturbances may predispose to dysrhythmia)
- management
  - rehydration
    - bolus of NS, then high rate NS infusion (beware of overhydration and cerebral edema, especially in pediatric patients)
    - beware of a pseudohyperonatremia due to hyperglycemia (add 3 Na⁺ per 10 glucose over 5.5 mmol/L)
  - potassium
    - essential to avoid hypokalemia: replace KCl (20 mEq/L if adequate renal function and initial K⁺ <3.5 mmol/L)
  - use cardiac monitoring if potassium levels normal or low
  - insulin
    - critical, as this is the only way to turn off gluconeogenesis/ketosis
    - do not give insulin if K⁺ <3.3 mmol/L
    - initial bolus of 5-10 U short-acting/regular insulin (or 0.2 U/kg) IV in adults (controversial – may just start with infusion)
    - followed by continuous infusion at 5-10 U (or 0.1 U/kg) per hour
    - add D5W to IV fluids when blood glucose <15 mmol/L to prevent hypoglycemia
  - bicarbonate is not given unless patient is at risk of death or shock (typically pH <7.0)

**Hyperosmolar Hyperglycemic State**
- state of extreme hyperglycemia (44-133.2 mmol/L) due to relative insulin deficiency, increased counter-regulatory hormones, gluconeogenesis, and dehydration (due to osmotic diuresis) in type 2 DM, high mortality (5-20%)
- history and physical exam
  - vitals, mental disturbances, coma, delirium, seizures
  - polyuria, N/V
  - find underlying cause
- investigations
  - CBC, electrolytes, Cr, BUN, glucose, Mg²⁺, PO₄³⁻, urine glucose and ketones, ABG
  - find underlying cause: ECG, CXR, blood and urine C&S
- management
  - rehydration with IV NS (total water deficit estimated at average 100 cc/kg body weight)
  - O₂ and cardiac monitoring, frequent electrolyte and glucose monitoring
  - insulin is controversial
  - identify and treat precipitant if present (the 5 Is)

  - find underlying cause: ECG, CXR, blood and urine C&S
- management
  - rehydration with IV NS (total water deficit estimated at average 100 cc/kg body weight)
  - O₂ and cardiac monitoring, frequent electrolyte and glucose monitoring
  - insulin is controversial
  - identify and treat precipitant if present (the 5 Is)
Hypoglycemia
- very common ED presentation
- history and physical exam
  - last meal, known DM, prior similar episodes, drug therapy, and compliance
  - liver/renal/endocrine/neoplastic disease
  - depression, alcohol or drug use
  - altered LOC with sympathomimetic response
- management
  - IV access and rapid blood glucose measurement
  - D50W 50 mL IV push, glucose PO if mental status permits
  - if IV access not possible, glucagon 1-2 mg IM, repeat x 1 in 10-20 min
  - O2, cardiac, frequent blood glucose monitoring
  - thiamine 100 mg IM
  - full meal as soon as mental status permits
  - if episode due to long-acting insulin, or sulfonylureas, watch for prolonged hypoglycemia due to long t1/2 (may require admission for monitoring)
  - search for cause (most often due to exogenous insulin, alcohol, or sulfonylureas)

Electrolyte Disturbances

Hypertensive Emergencies

Hypertensive Emergency (Hypertensive Crisis)

Etiology
- essential HTN, emotional exertion, pain, use of sympathomimetic drugs (cocaine, amphetamine, etc.), MAOI use with ingestion of tyramine-containing food (cheese, red wine, etc.), pheochromocytoma, pregnancy

Presentation
- elevation of systolic and diastolic BP (irrespective of BP) with acute end-organ damage (CNS, renal, CVS, retinal)
Table 21. Signs and Symptoms of Hypertensive Emergencies

<td>Eclampsia</td>
</tr>
</tbody>
</table>

Investigations
- CBC, electrolytes, BUN, Cr, U/A
- peripheral blood smear: to detect microangiopathic hemolytic anemia
- CXR: if SOB or chest pain
- ECG, troponins, CK: if chest pain
- CT head: if neurological findings or severe headache
- toxicology screen if sympathomimetic overdose suspected

Management
- in general, the strategy for management is to gradually and progressively reduce BP in 24-48 h
  - lower BP by 25% over the initial 60 min by initiating antihypertensive therapy (usually nitroprusside and labetalol)
  - if preeclampsia, immediately consult OB/GYN (see Obstetrics, OB25)
  - establish arterial line; transfer to ICU for further reduction in BP under monitored setting
  - in case of ischemic stroke: do not rapidly reduce BP, maintain BP >150/100 for 5 d
  - in case of aortic dissection: rapid reduction of sBP to 110-120 STAT (do not resuscitate with IV fluids)
  - in case of excessive catecholamines: avoid β-blockers (except labetalol)
  - in case of ACS: address ischemia initially, then BP

Hypertensive Urgency
- definition: severely elevated BP (usually sBP >180, dBP >115) with no evidence of end-organ damage
  - most commonly due to non-adherence with medications
  - treatment: initiate/adjust antihypertensive therapy, monitor in ED (up to 6 h) and discharge with follow up for 48-72 h
  - goal: differentiate hypertensive emergencies from hypertensive urgencies

HELLP Syndrome (seen only in preeclampsia/eclampsia)
- Hemolytic anemia
- Elevated Liver enzymes
- Low Platelet count

Catecholamine-Induced Hypertensive Emergencies
- Avoid use of non-selective β-blockers as they inhibit β-mediated vasodilation and leave α-adrenergic vasoconstriction unopposed

With CNS manifestations of severe HTN, it is often difficult to differentiate causal relationships (i.e. HTN could be secondary to a cerebral event with an associated Cushing reflex)
### Myocardial Infarction

- see [Cardiology and Cardiac Surgery], C28

**Management**
- early recognition of ACS on history and ECG
- immediate stabilization
  - ABCs, O₂, IV access, cardiac monitors
  - treat sustained ventricular arrhythmia as per ACLS
  - benzodiazepines for cocaine-related ACS
  - nitroglycerin 0.3 mg SL q5min x 3 for CHF, HTN, or pain; IV if persistent symptoms (contraindicated if hemodynamic compromise or phosphodiesterase inhibitor use)
  - previously, morphine used if unresponsive to nitroglycerin; however, it may impair activity of new antiplatelet agents
  - ASA 162-325 mg chewed and swallowed or if unable, per rectum
  - choice of anticoagulation (unfractionated heparin, LMWH, or fondaparinux) and additional antiplatelet therapy (clopidogrel, ticagrelor, or plasugrel) depends on STEMI vs. NSTEMI and reperfusion strategy
  - early cardiology consult and reperfusion therapy
    - UA/NSTEMI: early coronary angiography recommended if high TIMI risk score
    - STEMI: primary percutaneous coronary intervention (within 90 min) preferred; thrombolytics if unavailable within 120 min of medical contact, symptoms <12 hr and no contraindications
  - β-blocker if no signs of CHF, hemodynamic compromise, bradycardia or severe reactive airway disease
  - atorvastatin 80 mg to stabilize plaques

### Sepsis

- see [Infectious Diseases], ID22 and [Respirology], R33

**Management**
- early recognition of sepsis and investigations to locate source of infection
- identify severe sepsis with lactate or evidence of tissue hypoperfusion
- treatment priorities
  - ABCs, monitors and lines
  - aggressive fluid resuscitation; consider ventilatory and intropic support
  - cultures, then early empiric appropriate antibiotics - consider broad spectrum and atypical coverage
  - source control - e.g. remove infected Foley or surgery for ischemic gut
  - monitor adequate resuscitation with vital signs, inferior vena cava on U/S, and serial lactates
**Stroke and TIA**

- see Neurology, N50

**Definitions**
- Stroke: sudden loss of brain function due to ischemia (80%) or hemorrhage (20%) with persistence of symptoms >24 hr or neuroimaging evidence
- TIA: transient episode of neurologic dysfunction from focal ischemia without acute infarction typically lasting <1 h, but defined as <24 h

**Presentation**

**Table 23. Signs and Symptoms of Stroke**

<td>Contralateral hemiparesis (arm and face weakness &gt; leg weakness) and hypothesia, ipsilateral hemianopsia, gaze preference to side of lesion ± agnosia, receptive/expressive aphasia</td>
</tr>
<tr>
<td>Posterior Cerebral Artery</td>
<td>Affects vision and thought, homonymous hemianopsia, cortical blindness, visual agnosia, altered mental status, impaired memory</td>
</tr>
<tr>
<td>Vertebralbasilar Artery</td>
<td>Wide variety of cranial nerve, cerebellar, and brainstem deficits: vertigo, nystagmus, diplopia, visual field deficits, dysphagia, dysarthria, facial hypothesia, syncope, ataxia</td>
</tr>
</tbody>
</table>

**Investigations**
- CBC, electrolytes, blood glucose, coagulation studies ± cardiac biomarkers ± toxicology screen
- non-contrast CT head: look for hemorrhage, ischemia
- ECG ± echocardiogram: rule out AFib, acute MI as source of emboli
- other imaging: carotid Dopplers, CTA, MRA as indicated

**Management**
- ABCs; intubation with RSI if GCS ≤8, rapidly decreasing GCS, or inadequate airway protection reflexes
- thrombolysis: immediate assessment for eligibility; need acute onset, <4.5 h from drug administration time AND compatible physical findings AND normal CT with no bleed
- elevating head of bed if risk of elevated ICP, aspiration, or worsening cardiopulmonary status
- NPO, IV ± cardiac monitoring
- judge fluid rate carefully to avoid overhydration (cerebral edema) as well as underhydration (underperfusion of the ischemic penumbra)
- BP control: only treat severe HTN (sBP >200, dBP >120, mean arterial BP >140) or HTN associated with hemorrhagic stroke transformation, cardiac ischemia, aortic dissection, or renal damage; use IV nitropresoride or labetalol
- glycemic control: keep fasting glucose <6.5 in acute phase (5 d)
- cerebral edema control: hyperventilation, mannitol to decrease ICP if necessary
- consult neurosurgery, neurology, medicine as indicated

**Medications**
- acute ischemic stroke: thrombolytics (rt-PA, e.g. alteplase) if within 4.5 h of symptom onset with no evidence of hemorrhage on CT scan
- antplatelet agents: prevent recurrent stroke or stroke after TIs, e.g. Aspirin® (1st line); clopidogrel, Aggrenox® (2nd line)
- anticoagulation: DVT prophylaxis if immobile; treat AFib if present
- follow-up for consideration of carotid endarterectomy, cardiovascular risk optimization
Otolaryngological Presentations and Emergencies

- see Otolaryngology, OT6
- ear associated symptoms: otalgia, aural fullness, otorrhea, hearing loss, tinnitus, vertigo, pruritis, fever
- risk factors: Q-tip use, hearing aids, headphones, occupational noise exposure

Dizziness and Vertigo

- distinguish four types of dizziness: vertigo (“room spinning”), lightheadedness (“disconnected from environment”), presyncope (“almost blacking out”), dysequilibrium (“unstable, off-balance”)
- broad differential and diverse management (see Family Medicine, FM26; Otolaryngology, OT6, OT12)
- consider medication adverse effects

Otalgia (see Otolaryngology, OT6)

- differential
  - infections: acute otitis externa, acute otitis media, otitis media with effusion, mastoiditis, myringitis, malignant otitis in diabetics, herpes simplex/zoster, auricular cellulitis, external canal abscess, dental disease
  - others: trauma, temporomandibular joint dysfunction, neoplasm, foreign body, cerumen impactions, trigeminal neuralgia, granulomatosis with polyangiitis
- observe for otorrhea, palpation of outer ear/mastoid, otoscope to see bulging erythematous tympanic membrane, perforation
- C&S of ear canal discharge, if present
- CT head if suspicion of mastoiditis, malignant otitis externa
- antibiotics/antifungals/antivirals for respective infections

Hearing Loss (see Otolaryngology, OT7)

- differentiate conductive versus sensorineural hearing loss
- rule out sudden sensorineural hearing loss (SNHL), a medical emergency requiring high dose steroids and urgent referral
- in elderly, unilateral tinnitus or SNHL is acoustic neuroma until proven otherwise
- consider audiogram and referral or follow-up with family physician

Epistaxis

- see Otolaryngology, OT27
- 90% of nosebleeds stem from the anterior nasal septum (at Kiesselbach’s plexus located in Little’s area)
- can be life-threatening

Etiology

- most commonly caused by trauma (digital, blunt, foreign bodies)
- other causes: barometric changes, nasal dryness, chemicals (cocaine, Otrivin*), or systemic disease (coagulopathies, HTN, etc.)

Investigations

- blood work: CBC, PT/PTT (as indicated)
- imaging: X-ray, CT as needed

Treatment

- aim is to localize bleeding and achieve hemostasis
- first-aid: ABCs, clear clots by blowing nose or suctioning, lean forward, pinch cartilaginous portion of nose for 20 min twice
- assess blood loss: vitals, IV NS, cross match 2 units pRBC if significant
- if first aid measures fail twice, proceed to packing
- apply an anterior pack
  - clear nose of any clots
  - apply topical anesthesia/vasoconstrictors (lidocaine with epinephrine, cocaine, or soaked pledgets)
  - insert either a traditional Vaseline® gauze pack or a commercial nasal tampon or balloon
  - if bleeding stops, arrange follow-up in 48-72 h for reassessment and pack removal
  - if packing both nares, prophylactic anti-staphylococcal antibiotics to prevent sinusitis or toxic shock syndrome
  - if bleeding is controlled with anterior pressure, cautery with silver nitrate can be performed if the site of bleeding is identified (one side of septum only because if both are cauterized this can lead to septal perforation)

Complications of Nasal Packing

- Hypoxemia
- Toxic-shock syndrome
- Aspiration
- Pharyngeal fibrosis/stenosis
- Alar/septal necrosis

Thrombocytopenic patients – use resorbable packs to avoid risk of re-bleeding caused by pulling out the removable pack
• if suspect posterior bleed or anterior packing does not provide hemostasis, consult ENT for posterior packing and further evaluation
  ▪ posterior packing (ENT consult)
  ▪ posterior packing requires monitoring because can cause significant vagal response and posterior bleeding source can lead to significant blood loss

Disposition
• discharge: discharged upon stabilization and appropriate follow-up; educate patients about prevention (e.g. humidifiers, saline spray, topical ointments, avoiding irritants, managing HTN)
• admission: severe cases of refractory bleeding

Gynecologic/Urologic Emergencies

Vaginal Bleeding
• see Gynecology, GY6 and Obstetrics, OB14, OB45

Etiology
• pregnant patient
  ▪ 1st/2nd trimester pregnancy: ectopic pregnancy, abortion (threatened, incomplete, complete, missed, inevitable, septic), molar pregnancy, implantation bleeding, friable cervix (most common cause)
  ▪ 2nd/3rd trimester pregnancy: placenta previa, placental abruption, premature rupture of membranes, preterm labour
  ▪ other: trauma, bleeding cervical polyp, passing of mucous plug
• postpartum
• postpartum hemorrhage, uterine inversion, retained placental tissue, endometritis
• non-pregnant patients
  ▪ dysfunctional uterine bleeding, uterine fibroids, pelvic tumours, trauma, endometriosis, PID, exogenous hormones

History
• characterize bleeding (frequency, duration, number of pads/tampons, cyclicity)
• pain, if present (OPQRSTU)
• menstrual history, sexual history, STI history, syncope/pre-syncope
• details of pregnancy, including gush of fluid and fetal movement (>20 wk)

Physical Exam
• ABC (especially noting postural BP/HR and mucous membrane)
• abdominal examination (peritoneal signs, tenderness, distension, mass)
• speculum examination (NOT IF 2nd/3rd trimester bleeding; perform only when placenta previa is ruled out with U/S)
  ▪ look for active bleeding, trauma/anomaly, and cervical dilatation
  ▪ use sterile speculum if pregnant
• bimanual examination (cervical tenderness, size of uterus, cervical length/dilatation)
• sterile gloves if pregnant

Investigations
• β-hCG test for all patients with childbearing potential
• CBC, blood and Rh type, quantitative β-hCG, PTT, INR
• type and cross if significant blood loss
• transvaginal U/S (rule out ectopic pregnancy and spontaneous abortion)
• abdominal U/S (rule out placenta previa and fetal demise)
• postpartum
• U/S for retained products
• β-hCG if concerned about retained tissue

Management
• ABCs
• pulse oximeter and cardiac monitors if unstable
• Rh immune globulin (Rhogam®) for vaginal bleeding in pregnancy and Rh-negative mother
• 1st/2nd trimester pregnancy
  ▪ ectopic pregnancy: definitive treatment with surgery or methotrexate
  ▪ intrauterine pregnancy, no concerns of coexistent ectopic: discharge patient with obstetrics follow-up
• U/S indeterminate or β-hCG >1,000-2,000 IU: further workup and/or gynecology consult
• abortions: if complete, discharge if stable; for all others, acquire gynecology consult

Vaginal bleeding can be life-threatening
Always start with ABC’s and ensure your patient is stable

Need β-hCG ≥1,200 to see intrauterine changes on transvaginal U/S

An ectopic pregnancy can be ruled out by confirming an intrauterine pregnancy by bedside U/S unless the patient is using IVF

Vaginal bleeding (and its underlying causes) can be a very distressing event for patients; ensure appropriate support is provided
• 2nd/3rd trimester pregnancy
  - placenta previa or placental abruption: obstetrics consult for possible admission
• postpartum
  - manage ABCs: start 2 large bore IV rapid infusion, type and cross 4 units of blood, consult OB/GYN immediately
• non-pregnant
  - dysfunctional uterine bleeding (prolonged or heavy flow ± breakthrough bleeding and without ovulation, a diagnosis of exclusion)
    - <35-40 yr of age: Provera® 10 mg PO OD x 10 d, warn patient of a withdrawal bleed, discharge if stable
    - if unstable, admit for IV hormonal therapy, possible D&C
    - >35-40 yr of age: uterine sampling necessary prior to initiation of hormonal treatment to rule out endometrial cancer, U/S for any masses felt on exam
    - tranexamic acid (Cyklokapron®) to stabilize clots
  - structural abnormalities: fibroids or uterine tumours may require excision for diagnosis/treatment, U/S for workup of other pelvic masses, Pap smear/biopsy for cervical lesions

Disposition
• decision to admit or discharge should be based on the stability of the patient, as well as the nature of the underlying cause; consult gynecology for admitted patients
• if patient can be safely discharged, ensure follow-up with family physician or gynecologist
• instruct patient to return to ED for increased bleeding, presyncope

### Pregnant Patient in the ED

#### Table 25. Complications of Pregnancy

<table>
<thead>
<tr>
<th>Trimester</th>
<th>Fetal</th>
<th>Maternal</th>
</tr>
</thead>
</table>
| First 1-12 wk | Pregnancy failure  
• Spontaneous abortion  
• Fetal demise  
• Gestational trophoblastic disease | Ectopic pregnancy  
Anemia  
Hyperemesis gravidarum  
UTI/pyelonephritis |
| Second 13-27 wk | Disorders of fetal growth  
• IUGR  
• Oligo/polyhydramnios | Gestational DM  
Rh incompatibility  
UTI/pyelonephritis |
| Third 28-41 wk | Vasa previa | Preterm labour/PPROM  
Preeclampsia/eclampsia  
Placenta previa  
Placental abruption  
Uterine rupture  
DVT |

### Nephrolithiasis (Renal Colic)

- see Urology, U17

#### Epidemiology and Risk Factors
- 10% of population (twice as common in males)
- recurrence 50% at 5 yr
- peak incidence 30-50 yr of age
- 75% of stones <5 mm pass spontaneously within 2 wk, larger stones may require consultation

#### Clinical Features
- urinary obstruction → upstream distention of ureter or collecting system → severe colicky pain
- may complain of pain at flank, groin, testes, or tip of penis
- writhing, never comfortable, N/V, hematuria (90% microscopic), diaphoresis, tachycardia, tachypnea
- occasionally symptoms of trigonal irritation (frequency, urgency)
- fever, chills, rigors in secondary pyelonephritis
- peritoneal findings/anterior abdominal tenderness usually absent

#### Differential Diagnosis of Renal Colic
- acute ureteric obstruction
- acute abdomen: biliary, bowel, pancreas, AAA
- gynaecological: ectopic pregnancy, torsion/rupture of ovarian cyst
- pyelonephritis (fever, chills, pyuria, vomiting)
- radiculitis (L1): herpes zoster, nerve root compression
Investigations
- screening
- CBC → elevated WBC in presence of fever suggests infection
- electrolytes, Cr, BUN → to assess renal function
- U/A: WBCs, RBCs, crystals, C&S
- imaging
- non-contrast spiral CT is the study of choice
- abdominal U/S may demonstrate stone or hydronephrosis (consider in females of childbearing age)
- AXR will identify large radioopaque stones (calcium, struvite, and cystine stones) but may miss smaller stones, uric acid stones, or stones overlying bony structures; consider as an initial investigation in patients who have a history of radioopaque stones and similar episodes of acute flank pain (CT necessary if film is negative)
- strain all urine ← stone analysis

Management
- analgesics: NSAIDs (usually ketorolac [Toradol®], preferable over opioids), antiemetics, IV fluids
- urology consult may be indicated, especially if stone >5 mm, or if patient has signs of obstruction or infection
- α-blocker (e.g. tamsulosin) helpful to increase stone passage in select cases

Disposition
- most patients can be discharged
- ensure patient is stable, has adequate analgesia, and is able to tolerate oral medications
- may advise hydration and limitation of protein, sodium, oxalate, and alcohol intake

Ophthalmologic Emergencies
- see Ophthalmology, OP5

History and Physical Exam
- patient may complain of pain, tearing, itching, redness, photophobia, foreign body sensation, trauma
- mechanism of foreign body insertion – if high velocity injury suspected (welding, metal grinding, metal striking metal), must obtain orbital X-rays, U/S, or CT scan to exclude presence of intraocular metallic foreign body
- visual acuity in both eyes, pupils, extraocular structures, fundoscopy, tonometry, slit lamp exam

Management of Ophthalmologic Foreign Body
- copious irrigation with saline for any foreign body
- remove foreign body under slit lamp exam with cotton swab or sterile needle
- antibiotic drops qid until healed
- patching may not improve healing or comfort – do not patch contact lens wearers
- limit use of topical anesthetic to examination only
- consider tetanus prophylaxis
- ophthalmology consult if globe penetration suspected

Table 26. Differential Diagnosis of Red Eye in the Emergency Department

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Possible Serious Etiology</th>

### Dermatologic Emergencies

#### Life-Threatening Dermatoses

**Rash Characteristics**

**A. Diffuse Rashes**

- SSSS
  - caused by an exotoxin from infecting strain of coagulase-positive *S. aureus*
  - mostly occurs in children
  - prodrome: fever, irritability, malaise, and skin tenderness
  - sudden onset of diffuse erythema: skin is red, warm, and very tender
  - flaccid bullae that are difficult to see, then desquamate in large sheets
  - Nikolsky’s sign: gentle lateral stroking of skin causes epidermis to separate

- TEN (>30% of BSA)
  - see Dermatology, D23
  - caused by drugs (e.g. phenytoin, sulfas, penicillins, and NSAIDs), bone marrow transplantation, and blood product transfusions
  - usually occurs in adults
  - diffuse erythema followed by necrosis
  - severe mucous membrane blistering
  - entire epidermis desquamation
  - high mortality (>50%)

- TSS
  - see Infectious Diseases, ID23
  - caused by superantigen from *S. aureus* or GAS activating T-cell and cytokines
  - patient often presents with onset of shock and multi-organ failure, fever
  - diffuse erythematous macular rash
  - at least 3 organ systems involved: CNS, respiratory, GI, muscular, mucous membranes, renal, liver, hematologic, and skin (necrotizing fasciitis, gangrene)

- vesicobullous lesions

- EM
  - see Dermatology, D30
  - immunologic reaction to herpes simplex
  - viral prodrome 1-14 d before rash
  - "target lesion": central grey bulla or wheal surrounded by concentric rings of erythema and normal skin
SJS (<10% of BSA)
- see Dermatology, D23
- related to drugs such as antiepileptics and biologic agents (e.g. infliximab)
- EM with constitutional symptoms and mucous membrane involvement (milder mucous membrane involvement than TEN)

B. Discrete Lesions
- pyoderma gangrenosum
  - often associated with immunocompromised patients (HIV, leukemia, or lymphoma) with Gram-negative sepsis
  - often occurs in arms, hands, feet, or perineal region
  - usually begins as painless macule/vesicle → pustule/bulla on red/blue base → sloughing, leaving a gangrenous ulcer
- disseminated gonococcal infection
  - see Dermatology, D33
  - fever, skin lesions (pustules/vesicles on erythematous base ~5 mm in diameter), arthritis (joint swelling and tenderness), and septic arthritis (in larger joints, such as knees, ankles, and elbows)
  - most commonly in gonococcus positive women during menstruation or pregnancy
  - skin lesions usually appear in extremities and resolve quickly (<7 d)
- meningococcemia
  - flu-like symptoms of headache, myalgia, N/V
  - petechial, macular, or maculopapular lesions with gray vesicular centres
  - usually a few millimeters in size, but may become confluent and hemorrhagic
  - usually appear in extremities, but may appear anywhere
  - look for signs of meningeal irritation: Brudzinski, Kernig, nuchal rigidity, jolt accentuation

History and Physical Exam
- determine onset, course, and location of skin lesions
- fever, joint pain
- associated symptoms: CNS, respiratory, GU, GI, renal, liver, mucous membranes
- medication history
- vitals

Investigations
- immediate consultation if patient unstable
- CBC, electrolytes, Cr, AST, ALT, ALP, blood culture, skin biopsy, serum immunoglobulin levels (serum IgE)

Management
- general: judicious IV fluids and electrolyte control, consider vaspressors if hypotensive, prevention of infection
- determine if admission and consult needed: dermatology or infectious diseases
- specific management is determined by etiology
  - SSSS, TSS, DGI, and meningococcemia
    - IV antibiotics
  - EM, SJS, and TEN
    - stop precipitating medication
    - fluids
    - symptomatic treatment: antihistamines, antacids, topical corticosteroids, systemic corticosteroids (controversial), prophylactic oral acyclovir, consider IVIG
  - TEN: debride necrotic tissue

Disposition
- most cases will require urgent care and hospitalization
- TEN: early transfer to burn centre improves outcome
Environmental Injuries

Heat Exhaustion and Heat Stroke

- **predisposing factors:** young persons who overexert themselves, older adults who cannot dissipate heat at rest (e.g. using anticholinergic drugs such as antihistamines or TCAs), and patients with schizophrenia who are using anticholinergic or antiepileptic medications

**Heat Exhaustion**
- clinical features relate to loss of circulating volume caused by exposure to heat stress
- “water depletion”: heat exhaustion occurs if lost fluid not adequately replaced
- “salt depletion”: heat exhaustion occurs when losses replaced with hypotonic fluid

**Heat Stroke**
- life-threatening emergency resulting from failure of normal compensatory heat-shedding mechanisms
- divided into classical and exertional subtypes
- if patient does not respond relatively quickly to cooling treatments, consider other possible etiologies of hyperpyrexia (e.g. meningitis, thyroid storm, anticholinergic poisoning, delirium tremens, other infections)

<table>
<thead>
<tr>
<th>Table 28. Heat Exhaustion vs. Heat Stroke</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Clinical Features</strong></td>
</tr>
<tr>
<td>- Non-specific malaise, headache, fatigue</td>
</tr>
<tr>
<td>- Body temp &lt;40.5°C (usually normal)</td>
</tr>
<tr>
<td>- No coma or seizures</td>
</tr>
<tr>
<td>- Dehydration (↑ HR, orthostatic hypotension)</td>
</tr>
<tr>
<td><strong>Treatment</strong></td>
</tr>
<tr>
<td>- Rest in a cool environment</td>
</tr>
<tr>
<td>- IV NS if orthostatic hypotension; otherwise replace losses slowly PO</td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

Hypothermia and Cold Injuries

**HYPOTHERMIA**
- predisposing factors: extremes of age, lack of housing, drug overdose, EtOH ingestion, trauma (incapacitating), cold water immersion, outdoor sports
- treatment based on re-warming and supporting cardiorespiratory function
- complications: coagulopathy, acidosis, ventricular dysrhythmias (VFib), asystole, volume and electrolyte depletion
- labs: CBC, electrolytes, ABG, serum glucose, Cr/BUN, Mg²⁺, Ca²⁺, amylase, coagulation profile
- imaging: CXR (aspiration pneumonia, pulmonary edema are common)
- monitors: ECG, rectal thermometer, Foley catheter, NG tube, monitor metabolic status frequently

<table>
<thead>
<tr>
<th>Table 29. Classification of Hypothermia</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Class</strong></td>
</tr>
<tr>
<td>Mild</td>
</tr>
<tr>
<td>Moderate</td>
</tr>
<tr>
<td>Severe</td>
</tr>
</tbody>
</table>
Re-warming Options
- gentle fluid and electrolyte replacement in all (due to cold diuresis)
- Passive External Re-warming
  - suitable for most stable patients with core temperature >32.2°C
  - involves covering patient with insulating blanket; body generates heat and re-warms through metabolic process, shivering
- Active External Re-warming
  - involves use of warming blankets
  - beware of “afterdrop” phenomenon
  - safer when done in conjunction with active core re-warming
- Active Core Re-warming
  - generally for patients with core temperature <32.2°C, and/or with cardiovascular instability
  - avoids “afterdrop” seen with AER alone
  - re-warm core by using
    - warmed humidified oxygen, IV fluids
    - peritoneal dialysis with warm fluids
    - gastric/colonic/pleural irrigation with warm fluids
    - external circulation (cardiopulmonary bypass machine) is most effective and fastest

Approach to Cardiac Arrest in the Hypothermic Patient
- do all procedures gently or may precipitate VFib
- check pulse and rhythm for at least 1 min; may have profound bradycardia
- if any pulse at all (even very slow) do NOT do CPR
- if in VFib try to defibrillate up to maximum 3 shocks if core temperature <30°C
- intubate if required, ventilate with warmed, humidified O₂
- medications (vasopressors, antidysrhythmics) may not be effective at low temperatures
  - controversial; may try one dose
- focus of treatment is re-warming

FROSTBITE
Classification
- ice crystals form between cells
- classified according to depth – similar to burns (1st to 3rd degree)
  - 1st degree
    - symptoms: initial paresthesia, pruritus
    - signs: erythema, edema, hyperemia, no blisters
  - 2nd degree
    - symptoms: numbness
    - signs: blistering (clear), erythema, edema
  - 3rd degree
    - symptoms: pain, burning, throbbing (on thawing); may be painless if severe
    - signs: hemorrhagic blisters, skin necrosis, edema, no movement

Management
- treat for hypothermia: O₂, IV fluids, maintenance of body warmth
- remove wet and constrictive clothing
- immerse in 40–42°C agitated water for 10-30 min (very painful; administer adequate analgesia)
- clean injured area and leave it open to air
- consider aspiration/debridement of blisters (controversial)
- debride skin
- tetanus prophylaxis
- consider penicillin G as frost bite injury has high risk of infection
- surgical intervention may be required to release restrictive eschars
- never allow a thawed area to re-chill/freeze

Burns
- see Plastic Surgery, PL17

Physical Exam
- burn size
  - rule of nines; does not include 1st degree burns
- burn depth
  - superficial (1st degree): epidermis only (e.g. sunburn), painful and tender to palpation
  - superficial partial thickness (2nd degree): extends to epidermis and superficial dermis, blister formation occurs, very painful
  - deep partial thickness (2nd degree): involves hair follicles, sebaceous glands; skin is blistered, exposed dermis is white to yellow, absent sensation

Figure 15. Rule of 9s for total BSA
full thickness (3rd degree): epidermis and all dermal layers; skin is pale, insensate, and charred or leathery
- deep (4th degree): involvement of fat, muscle, even bone

Management
- remove noxious agent/stop burning process
- establish airway if needed (indicated with burns >40% BSA or smoke inhalation injury)
- resuscitation for 2nd and 3rd degree burns (after initiation of 2 large bore IVs)
- fluid boluses if unstable
  - Parkland Formula: Ringer's lactate 4 cc/kg/%BSA burned; give half in first 8 h, half in next 16 h; maintenance fluids are also required if patient cannot tolerate PO hydration
  - urine output is best measure of resuscitation, should be 40-50 cc/h or 0.5 cc/kg/h; avoid diuretics
- pain relief: continuous morphine infusion with breakthrough bolus
- investigations: CBC, electrolytes, U/A, CXR, ECG, ABG, carboxyhemoglobin
- burn wound care: prevent infection, clean/debride with mild soap and water, sterile dressings
- escharotomy or fasciotomy for circumferential burns (chest, extremities)
- topical antibiotics, systemic antibiotics infrequently indicated
- tetanus prophylaxis if burn is deeper than superficial dermis

Disposition
- admit
  - 2nd degree burns >10% BSA, or any significant 3rd degree burns
  - 2nd degree burns on face, hands, feet, perineum, or across major joints
  - electrical, chemical burns, and inhalation injury
  - burn victims with underlying medical problems or immunosuppressed patients

Inhalation Injury

Etiology
- CO or cyanide poisoning
- direct thermal injury: limited to upper airway
- smoke causes bronchospasm and edema from particulate matter and toxic inhalants (tissue asphyxiates, pulmonary irritants, systemic toxins)

History and Physical Exam
- risk factors: closed space fires, period of unconsciousness, noxious chemicals involved
- cherry red skin (unreliable, usually post-mortem finding)
- singed nasal hairs, soot on oral/nasal membranes, sooty sputum
- hoarseness, stridor, dyspnea
- decreased LOC, confusion
- PO2 normal but O2 saturation low suggests CO poisoning

Investigations
- measure carboxyhemoglobin levels, co-oximetry
- ABG
- CXR ± bronchoscopy

Management
- CO poisoning: 100% O2 ± hyperbaric O2 (controversial)
- direct thermal injury: humidified oxygen, early intubation, pulmonary toilet, bronchodilators

Bites

MAMMALIAN BITES
- see Plastic Surgery, PL10

History
- time and circumstances of bite, symptoms, allergies, tetanus immunization status, comorbid conditions, rabies risks, HIV/hepatitis risk (human bite)
- high morbidity associated with clenched fist injuries, “fight bites”

Physical Exam
- assess type of wound: abrasion, laceration, puncture, crush injury
- assess for direct tissue damage: skin, bone, tendon, neurovascular status
Investigations
- if bony injury or infection suspected, check for fracture and gas in tissue with x-rays
- get skull films in children with scalp bite wounds ± CT to rule out cranial perforation

Initial Management
- wound cleansing and copious irrigation as soon as possible
- irrigate/debride puncture wounds if feasible, but not if sealed or very small openings; avoid hydrodissection along tissue planes
- debridement is important in crush injuries to reduce infection and optimize cosmetic and functional repair
- culture wound if signs of infection (erythema, necrosis, or pus); obtain anaerobic cultures if wound foul smelling, necrotizing, or abscess; notify lab that sample is from bite wound

Prophylactic Antibiotics
- types of infections resulting from bites: cellulitis, lymphangitis, abscesses, tenosynovitis, osteomyelitis, septic arthritis, sepsis, endocarditis, meningitis
- a 3-5 d course of antibiotics is recommended for all bite wounds to the hand and should be considered in other bites if any high-risk factors present (efficacy not proven)
- dog and cat bites (pathogens: Pasteurella multocida, S. aureus, S. viridans)
  - 10-50% of cat bites, 5% of dog bites become infected
  - 1st line: amoxicillin + clavulanic acid
- human bites (pathogens: Eikenella corrodens, S. aureus, S. viridans, oral anaerobes)
  - 1st line: amoxicillin + clavulanic acid
- rabies (see Infectious Diseases, ID21)
  - reservoirs: warm-blooded animals except rodents, lagomorphs (e.g. rabbits)
  - post-exposure vaccine is effective; treatment depends on local prevalence
- suturing
  - vascular structures (i.e. face and scalp) are less likely to become infected, therefore consider suturing
  - allow avascular structures (i.e. pretibial regions, hands, and feet) to heal by secondary intention
  - tetanus immunization if >10 yr or incomplete primary series

SNAKE BITES
- history, physical exam, investigations, and initial management similar to mammalian bites
- additional management issues
  - snake bites are rarely fatal, but proper precautions must be taken
  - supportive management, observe for compartment syndrome, analgesia, tetanus prophylaxis
  - contact Provincial Poison Information Centre for consultation
  - for the Massasauga rattlesnake ONLY: if no signs of local tissue damage AND an INR is normal at 6 h after the bite, the patient may be discharged
  - there is NO evidence that constriction bands are helpful AND can be harmful
  - if envenomation present, administer antivenom as directed by local Poison Information Centre

INSECT BITES
- bee stings
  - 5 types of reactions to stings (local, large local, systemic, toxic, unusual)
  - history and physical exam key to diagnosis; no lab test will confirm
  - investigations: CBC, electrolytes, BUN, Cr, glucose, ABGs, ECG
  - ABC management, epinephrine 0.1 mg IV over 5 min if shock, antihistamines, cimetidine 300 mg IV/IM/PO, steroids, β-agonists for SOB/wheezing 3 mg in 5 mL NS via nebulizer, local site management
  - West Nile virus (see Infectious Diseases, ID24)

Near Drowning
- most common in children <4 yr and teenagers
- causes lung damage, hypoxemia, and may lead to hypoxic encephalopathy
- must also assess for shock, C-spine injuries, hypothermia, and scuba-related injuries (barotrauma, air emboli, lung re-expansion injury)
- complications: volume shifts, electrolyte abnormalities, hemolysis, rhabdomyolysis, renal, DIC

Physical Exam
- ABCs, vitals: watch closely for hypotension
- respiratory: rales (ARDS, pulmonary edema), decreased breath sounds (pneumothorax)
- CVs: murmurs, dysrhythmias, JVP (CHE, pneumothorax)
- H&N: assess for C-spine injuries
- neurological: GCS or AVPU, pupils, focal deficits
Investigations
- labs: CBC, electrolytes, ABGs, Cr, BUN, INR, PTT, U/A (drug screen, myoglobin)
- imaging: CXR (pulmonary edema, pneumothorax) ± C-spine imaging
- ECG

Management
- ABCs, treat for trauma, shock, hypothermia
- cardiac and O2 monitors, IV access
- intensive respiratory care
  - ventilator assistance if decreased respirations, pCO₂ >50 mmHg, or pO₂ <60 mmHg on maximum O₂
  - may require intubation for airway protection, ventilation, pulmonary toilet
  - high flow O₂/CPAP/BiPAP may be adequate but some may need mechanical ventilation with positive end-expiratory pressure
- dysrhythmias: usually respond to corrections of hypoxemia, hypothermia, and acidosis
- vomiting: very common, NG suction to avoid aspiration
- convulsions: usually respond to O₂; if not, diazepam 5-10 mg IV slowly
- bronchospasm: bronchodilators
- bacterial pneumonia: prophylactic antibiotics not necessary unless contaminated water or hot tub (Pseudomonas)
- always initiate CPR in drowning-induced cardiac arrest even if patient hypothermic; continue CPR until patient is fully rewarmed

Disposition
- non-significant submersion: discharge after short observation
- significant submersion (even if asymptomatic): long period of observation (24 h) as pulmonary edema may appear late
- CNS symptoms or hypoxemia: admit
- severe hypoxemia, decreased LOC: ICU

Toxicology

“ABCD₃EFG” of Toxicology
- basic axiom of care is symptomatic and supportive treatment
- address underlying problem only once patient is stable

- Airway (consider stabilizing the C-spine)
- Breathing
- Circulation
- Drugs
  - ACLS as necessary to resuscitate the patient
  - universal antidotes
- Draw bloods
- Decontamination (decrease absorption)
- Expose (look for specific toxidromes)/Examine the patient
- Full vitals, ECG monitor, Foley, X-rays
- Give specific antidotes and treatments

- reassess
- call Poison Information Centre
- obtain corroborative history from family, bystanders

D1 – Universal Antidotes
- treatments that will not harm patients and may be essential

Dextrose (glucose)
- give to any patient presenting with altered LOC
- measure blood glucose prior to glucose administration if possible
- adults: 0.5-1.0 g/kg (1-2 mL/kg) IV of D50W
- children: 0.25 g/kg (2-4 mL/kg) IV of D25W

Oxygen
- do not deprive a hypoxic patient of oxygen no matter what the antecedent medical history (i.e. even COPD with CO₂ retention)
- if depression of hypoxic drive, intubate and ventilate
- exception: paraquat or diquat (herbicides) inhalation or ingestion (oxygen radicals increase morbidity)
Naloxone (central μ-receptor competitive antagonist, shorter t1/2 than naltrexone)
- antidote for opioids: administration is both diagnostic and therapeutic (1 min onset of action)
- used for the undifferentiated comatose patient
- loading dose
  - adults
    - response to naloxone can be drastic, so stepwise delivery of initial 2 mg bolus is recommended
    - draw up 2 mg to deliver IV/IM/SL/SC or via ETT (ETT dose = 2-2.5x IV dose)
      - 1st dose 0.4 mg
      - if no response, deliver second dose 0.6 mg
      - if still no response, deliver remaining 1 mg
  - child
    - 0.01 mg/kg initial bolus IV/IO/ETT
    - 0.1 mg/kg if no response and opioid still suspected to max of 10 mg
- maintenance dose
  - may be required because half-life of naloxone (30-80 min) is much shorter than many opioids
  - hourly infusion rate at 2/3 of initial dose that allowed patient to be roused

Thiamine (Vitamin B1)
- 100 mg IV/IM with IV/PO glucose to all patients
- given to prevent/treat Wernicke's encephalopathy
- a necessary cofactor for glucose metabolism (may worsen Wernicke's encephalopathy if glucose given before thiamine), but do not delay glucose if thiamine unavailable
- must assume all undifferentiated comatose patients are at risk

D2 – Draw Bloods
- essential tests
  - CBC, electrolytes, BUN/Cr, glucose, INR/PTT, osmolality
  - ABGs, measure O2 sat
  - ASA, acetylsalicylic acid, EtOH levels
- potentially useful tests
  - drug levels – this is NOT a serum drug screen
    - Ca²⁺, Mg²⁺, PO₄³⁻
  - protein, albumin, lactate, ketones, liver enzymes, CK – depending on drug and clinical presentation

Serum Drug Levels
- treat the patient, not the drug level
- negative toxicology screen does not rule out a toxic ingestion – signifies only that the specific drugs tested were not detectable in the specimen
- specific drugs available on general screen vary by institution; check before ordering
- urine screens also available (qualitative only)

Table 30. Toxic Gaps (see Nephrology, NP15)

<table>
<thead>
<tr>
<th>METABOLIC ACIDOSIS</th>
<th>Increased AG: “MUDPILES CAT” (↑ = toxic)</th>
<th>Decreased AG: Electrolyte imbalance (increased Na⁺/K⁺/Mg²⁺)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Methanol†</td>
<td>Diabetic ketoacidosis/Starvation ketoacidosis</td>
<td>Hypoalbuminemia (50% fall in albumin ~5.5 mmol/L decrease in the AG)</td>
</tr>
<tr>
<td>Uremia</td>
<td>Phenformin*/Paraldehyde*</td>
<td>Lithium, bromide elevation</td>
</tr>
<tr>
<td>Diabetic ketoacidosis/Starvation ketoacidosis</td>
<td>Isoniazid, Irubuprofen</td>
<td>Paraproteins (multiple myeloma)</td>
</tr>
<tr>
<td>Lactic acid (anything that causes seizures or shock)</td>
<td>Ethylene glycol*</td>
<td>Normal AG: High K⁺: pyelonephritis, obstructive nephropathy, renal tubular acidosis IV, TPN</td>
</tr>
<tr>
<td>Ethylene glycol*</td>
<td>Salicylates*</td>
<td>Low K⁺: small bowel losses, acetazolamide, renal tubular acidosis I, II</td>
</tr>
<tr>
<td>Cyanide, CO²†</td>
<td>Alcoholic ketoacidosis</td>
<td>Increased POG: “MAE DIE” (if it ends in “-ol”, it will likely increase the POG)</td>
</tr>
<tr>
<td>Toluene, theophylline*</td>
<td>Methanol†</td>
<td>Methanol</td>
</tr>
<tr>
<td>Methanol†</td>
<td>Acetone</td>
<td>Acetone</td>
</tr>
<tr>
<td>Ethanol</td>

<td>Isopropanol</td>
</tr>
<tr>
<td>Ethylene glycol</td>
<td></td>
<td>Ethylene glycol</td>
</tr>
</tbody>
</table>

Note: normal POG does not rule out toxic alcohol; only an elevated gap is helpful

Increased O₂ saturation gap
- Carboxyhemoglobin
- Methemoglobin
- Sulphmethemoglobin

Urine drug screen is costly and generally not helpful in the ED management of the poisoned patient

Administration of naloxone can cause opioid withdrawal in chronic users:
- Minor withdrawal may present as lacrimation, rhinorrhea, diaphoresis, yawning, piloerection, HTN, and tachycardia
- Severe withdrawal may present as hot and cold flashes, arthralgias, myalgias, N/V, and abdominal cramps

Populations at Risk for Thiamine Deficiency
- Alcoholics
- Anorexics
- Hyperemesis of pregnancy
- Malnutrition states

Anion Gap
- Na⁺ – Cl⁻ – HCO₃⁻
- Normal AG ≤ 12 mM/L

D3 – Decontamination and Enhanced Elimination

Ocular Decontamination
- saline irrigation to neutralize pH; alkali exposure requires ophthalmology consult

Dermal Decontamination (Wear Protective Gear)
- remove clothing, brush off toxic agents, irrigate all external surfaces

Gastrointestinal Decontamination
- single dose activated charcoal
  - adsorption of drug/toxin to activated charcoal prevents availability
  - contraindications: caustics, small bowel obstruction, perforation
  - dose: 10 g/g drug ingested or 1g/kg body weight
  - odourless, tasteless, prepared as slurry with H2O
- whole bowel irrigation
  - 500 mL/h (child) to 2000 mL/h (adult) of polyethylene glycol solution by mouth until clear effluent per rectum
  - start slow (500 mL in an adult) and aim to increase rate hourly as tolerated
  - indications
    - awake, alert, can be nursed upright OR intubated and airway protected
    - delayed release product
    - drug/toxin not bound to charcoal
    - drug packages (if any evidence of breakage → emergency surgery)
  - recent toxin ingestion
- contraindications
  - evidence of ileus, perforation, or obstruction
  - surgical removal in extreme cases
    - indicated for drugs that are toxic, form concretions, or cannot be removed by conventional means
  - no evidence for the routine use of cathartics (i.e. ipecac)

Urine Alkalization
- may be used for: ASA, methotrexate, phenobarbital, chloropropamide
- weakly acidic substances can be trapped in alkali urine (pH >7.5) to increase elimination

Multidose Activated Charcoal
- may be used for: carbamazepine, phenobarbital, quinine, theophylline
- for toxins which undergo enterohepatic recirculation
- removes drug that has already been absorbed by drawing it back into GI tract
- various regimens: 12.5 g (1/4 bottle) PO q1h or 25 g (1/2 bottle) PO q2h until non-toxic

Hemodialysis
- indications/criteria for hemodialysis
  - toxins that have high water solubility, low protein binding, low molecular weight, adequate concentration gradient, small volume of distribution, or rapid plasma equilibration
  - removal of toxin will lead to clinical improvement
• advantage is shown over other modes of therapy
• predicted that drug or metabolite will have toxic effects
• impairment of normal routes of elimination (cardiac, renal, or hepatic)
• clinical deterioration despite maximal medical support
• useful for the following toxins
  - methanol
  - ethylene glycol
  - salicylates
• others include theophylline, carbamazepine, valproate, methotruxate

### E – Expose and Examine the Patient

- vital signs (including temperature), skin (needle tracks, colour), mucous membranes, pupils, odours, and CNS
- head-to-toe survey including
  - C-spine
  - signs of trauma, seizures (incontinence, “tongue biting”, etc.), infection (meningismus), or chronic alcohol/drug abuse (track marks, nasal septum erosion)
- mental status

Note: ASA poisoning and hypoglycemia mimic sympathomimetic toxidrome

### F – Full Vitals, ECG Monitor, Foley, X-Rays
## Urine Alkalization Specific Antidotest and Treatments

- **Urine Alkalization Treatment for ASA Overdose**
  - urine pH >7.5
  - fluid resuscitate first, then 3 amps NaHCO₃/L of D5W at 1.5x maintenance
  - add 20-40 mEq/L KCl if patient is able to urinate

### Table 33. Protocol for Warfarin Overdose

<table>
<thead>
<tr>
<th>INR</th>
<th>Management: Consider Prothrombin Complex Concentrate (Octaplex®, Beriplex®) for any elevated INR, AND either life-threatening bleeding, or a plan for the patient to undergo a surgical procedure within the next 6 h</th>
</tr>
</thead>
<tbody>

<tr>
<td></td>
<td>Also consider cardiac and hypotension support, seizure control</td>
<td>Consider local Poison Information Centre</td>
</tr>
<tr>
<td></td>
<td>NaHCO₃ bolus for wide QRS/seizures</td>
<td>Inotropic therapy (consult local Poison Information Centre)</td>
</tr>
</tbody>
</table>

* Call local Poison Information Centre for specific doses and treatment recommendations
Alcohol Related Emergencies

- see Psychiatry, PS24

Acute Intoxication
- slurred speech, CNS depression, disinhibition, lack of coordination
- nystagmus, diplopia, dysarthria, ataxia may progress to coma
- hypotension (peripheral vasodilation)
- if obtunded, rule out
  - head trauma/intracranial hemorrhage
  - associated depressants/street drugs, toxic alcohols
    - may also contribute to respiratory/cardiac depression
  - hypoglycemia (screen with bedside glucometer)
  - hepatic encephalopathy: confusion, altered LOC, coma
    - precipitating factors: GI bleed, infection, sedation, electrolyte abnormalities, protein meal
  - Wernicke's encephalopathy (ataxia, ophthalmoplegia, delirium)
  - post-ictal state, basilar stroke

Withdrawal
- beware of withdrawal signs
- treatment
  - diazepam 10-20 mg IV/PO or lorazepam 2-4 mg IV/PO q1h until calm
  - frequency of dosing may have to be increased depending on clinical response
  - may use CIWA protocol and give benzodiazepines as above until CIWA <10
  - thiamine 100 mg IM/IV then 50-100 mg/d
  - magnesium sulfate 4 g IV over 1-2 h (if hypomagnesemic)
  - admit patients with DT or multiple seizures

Table 35. Alcohol Withdrawal Signs

<table>
<thead>
<tr>
<th>Time Since Last Drink</th>
<th>Syndrome</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>6-8 h</td>
<td>Mild withdrawal</td>
<td>Generalized tremor, anxiety, agitation, but no delirium</td>
</tr>

</tbody>
</table>

Cardiovascular Complications
- HTN
- cardiomyopathy; SOB, edema
- dysrhythmias (“holiday heart”)
- AFib (most common), atrial flutter, SVT, VTach (especially Torsades if hypomagnesemic/hypokalemic)

Metabolic Abnormalities
- alcoholic ketoacidosis
  - AG metabolic acidosis, urine ketones, low glucose, and normal osmolality
  - history of chronic alcohol intake with abrupt decrease/cessation
  - malnourished, abdominal pain with N/V
  - treatment: dextrose, thiamine (100 mg IM/IV prior to dextrose), volume repletion (with NS)
  - generally resolves in 12-24 h
- other alcohols
  - ethylene glycol → CNS, CVS, renal findings
  - methanol
    - early: lethargy, confusion
    - late: headache, visual changes, N/V, abdominal pain, tachypnea
  - both ethylene glycol and methanol produce severe metabolic acidosis with anion gap (as the alcohol is metabolized) and osmolar gap (initially after ingestion but before metabolism)
  - EtOH co-ingestion is protective
treatment
- urgent hemodialysis required
- fomepizole 15 mg/kg IV bolus OR EtOH 10% IV bolus and infusion to achieve blood level of 22 mmol/L (EtOH loading may be done PO)
- consider folic acid for methanol, and pyridoxine and thiamine for ethylene glycol – both help reduce conversion to active metabolites
- other abnormalities associated with alcohol: hypomagnesemia, hypophosphatemia, hypocalcemia, hypoglycemia, hypokalemia

Gastrointestinal Abnormalities
- gastritis
  - common cause of abdominal pain and GI bleed in chronic alcohol users
- pancreatitis
  - serum amylase very unreliable in patients with chronic pancreatitis, may need serum lipase
  - hemorrhagic form (15%) associated with increased mortality
  - fluid resuscitation very important
- hepatitis
  - AST/ALT ratio >2 suggests alcohol as the cause as well as elevated GGT with acute ingestion
- peritonitis/spontaneous bacterial peritonitis
  - leukocytosis, fever, generalized abdominal pain/tenderness
  - occasionally accompanies cirrhosis
  - paracentesis for diagnosis (common pathogens: E. coli, Klebsiella, Streptococcus)
- GI bleeds
  - most commonly gastritis or ulcers, even if patient known to have varices
  - consider Mallory-Weiss tear secondary to retching
  - often complicated by underlying coagulopathies
  - minor: treat with antacids
  - severe or recurrent: endoscopy

Disposition
- before patient leaves ED ensure stable vital signs, can walk unassisted, and fully oriented
- offer social services to find shelter or detox program
- ensure patient can obtain any medications prescribed and can complete any necessary follow-up

Approach to the Overdose Patient

History
- age, weight, underlying medical problems, medications
- substance and how much
- time and symptoms since exposure determines prognosis and need for decontamination
- route
- intention, suicidality

Physical Exam
- focus on: ABCs, LOC/GCS, vitals, pupils

Disposition from the Emergency Department
- methanol, ethylene glycol
  - delayed onset, admit and watch clinical and biochemical markers
- TCAs
  - prolonged/delayed cardiotoxicity warrants admission to monitored (ICU) bed
  - if asymptomatic and no clinical signs of intoxication: 6 h ED observation adequate with proper decontamination and no ECG abnormalities
  - sinus tachycardia alone (most common finding) with history of overdose warrants observation in ED
- hydrocarbons/smoke inhalation
  - pneumonitis may lag 6-8 h
  - consider observation for repeated clinical and radiographic examination
- ASA, acetaminophen
  - if borderline level, get second level 2-4 h after first
  - for ASA, must have at least 2 levels going down before discharge (3 levels minimum)
- oral hypoglycemics
  - admit all patients for minimum 24 h if hypoglycemic and 12 h after last octreotide dose
  - observe asymptomatic patient for at least 8 h

Psychiatric Consultation
- once patient medically cleared, arrange psychiatric intervention if required
- beware – suicidal ideation may not be expressed
Psychiatric Emergencies

Approach to Common Psychiatric Presentations

• see Psychiatry, PS2
• before seeing patient, ensure your own safety; have security/police available if necessary

History
• safety
  ▸ assess suicidality: suicidal ideation (SI), intent, plan, lethal means, and past attempts
  ▸ assess homicidality: homicidal ideation (HI), access to weapons, intended victim, and history of violence
  ▸ driving and children
  ▸ command hallucinations
  ▸ identify current stressors and coping strategies
• mood symptoms: manic, depressive
• anxiety: panic attacks, generalized anxiety, phobias, obsessive-compulsive disorder, post-traumatic stress disorder
• psychotic symptoms: delusions, hallucinations, disorganized speech, disorganized or catatonic behaviour, negative symptoms (affective flattening, alogia, avolition)
• substance use history: most recent use, amount, previous withdrawal reactions
• past psychiatric history, medications, adherence with medications
• medical history: obtain collateral if available

Physical Exam
• complete physical exam focusing on: vitals, neurological exam, signs of head trauma, signs of drug toxicity, signs of metabolic disorder
• mental status exam: general appearance, behavior, cooperation, speech, mood and affect, thought content and form, perceptual disturbances, cognition (including MMSE if indicated), judgment, insight, reliability

Investigations
• investigations vary with age, established psychiatric diagnosis vs. first presentation, history and physical suggestive of organic cause
• as indicated: blood glucose, urine and serum toxicology screen, pregnancy test, electrolytes, TSH, AST/ALT, bilirubin, serum Cr, BUN, osmolality
• blood levels of psychiatric medications
• CT head if suspect neurological etiology
• LP if indicated

Acute Psychosis

Differential Diagnosis
• primary psychotic disorder (e.g. schizophrenia)
• secondary to medical condition (e.g. delirium)
• drugs: substance intoxication or withdrawal, medications (e.g. steroids, anticholinergics)
• infectious (CNS)
• metabolic (hypoglycemic, hepatic, renal, thyroid)
• structural (hemorrhage, neoplasm)

Management
• violence prevention
  ▸ remain calm, empathic, and reassuring
  ▸ ensure safety of staff and patients, have extra staff and/or security on hand
  ▸ patients demonstrating escalating agitation or overt violent behavior may require physical restraint and/or chemical tranquillization
  ▸ treat agitation: whenever possible, offer medication to patients as opposed to administering with force (helps calm and engage patient)
    ▸ benzodiazepines: lorazepam 2 mg PO/IM/SL
    ▸ antipsychotics: olanzapine 5 mg PO, haloperidol 5 mg PO/IM
• treat underlying medical condition
• psychiatry or Crisis Intervention Team consult

Key Functions of Emergency Psychiatric Assessment
• Is the patient medically stable?
• Rule out medical cause
• Is psychiatric consult needed?
• Are there safety issues (SI, HI)?
• Is patient certifiable? (must demonstrate risk [present/past test] and apparent mental illness [future test])

Psychiatric Review of Systems
MOAPS
Mood
Organic
Anxiety
Psychosis
Safety
**Suicidal Patient**

**Epidemiology**
- attempted suicide F>M, completed suicide M>F
- second leading cause of death in people <24 yr

**Management**
- ensure patient safety: close observation, remove potentially dangerous objects from person and room
- assess thoughts (ideation), means, action (preparatory, practice attempts), previous attempts
- admit if there is evidence of intent and organized plan, access to lethal means, psychiatric disorder, intoxication (suicidal ideation may resolve with few days of abstinence)
- patient may require certification if unwilling to stay voluntarily
- do not start long-term medications in the ED
- psychiatry or Crisis Intervention Team consult

**Common Pediatric ED Presentations**

**Modified Glasgow Coma Score**

**Respiratory Distress**

- see Pediatrics, P74

**History and Physical Exam**
- infants not able to feed, older children not able to speak in full sentences
- anxious, irritable, lethargic – may indicate hypoxia
- tachypnea >60 (>40 if preschool age, >30 if school age), retractions, tracheal tug
  - see Pediatrics, P3 for age specific vital signs
- pulsus paradoxus
- wheezing, grunting, vomiting

¹Now rare with Hib vaccine in common use
Management

- croup (usually laryngotracheitis caused by parainfluenza viruses)
  - humidified O₂ should not be given (no evidence for efficacy)
  - racemic epinephrine q1h x 3 doses, observe for ‘rebound effects’
  - nebulized 1:1000 epinephrine (racemic has limited availability)
  - dexamethasone x 1 dose
  - consider bacterial tracheitis/epiglottitis if unresponsive to croup therapy

- bacterial tracheitis
  - start croup therapy, but may have poor response
  - usually require intubation, ENT consult, ICU
  - start antibiotics (e.g. cloxacillin), pending C&S

- epiglottitis
  - 4 Ds: drooling, dyspnea, dysphagia, dysphonia + tripod sitting
  - do not examine oropharynx or agitate patient
  - immediate anesthesia, ENT call – intubate
  - then IV fluids, antibiotics, blood cultures

- asthma
  - supplemental O₂ if saturation <90% or PaO₂ <60%
  - bronchodilator therapy: salbutamol (Ventolin®) 0.15 mg/kg by masks q20min x 3
  - add 250-500 µg ipratropium (Atrovent®) to first 3 doses salbutamol
  - give corticosteroid therapy as soon as possible after arrival (prednisolone 2 mg/kg, dexamethasone 0.3 mg/kg)
  - if critically ill, not responding to inhaled bronchodilators or steroids: give IV bolus, then infusion of MgSO₄
  - IV β₂-agonists if critically ill and not responding to above

Febrile Infant and Febrile Seizures

FEBRILE INFANT
- see Pediatrics, P53
  - for fever >38ºC without obvious focus
    - <28 d
      - admit
      - full septic workup (CBC and differential, blood C&S, urine C&S, LP ± stool C&S, CXR if indicated)
      - treat empirically with broad spectrum IV antibiotics
    - 28-90 d
      - as above unless infant meets Rochester criteria, investigate as indicated by history and physical
    - >90 d
      - toxic: admit, treat, full septic workup
      - non-toxic and no focus: investigate as indicated by history and physical

FEBRILE SEIZURES
- see Pediatrics, P84

Etiology

- children aged 6 mo-6 yr with fever or history of recent fever
- typical vs. atypical febrile seizures
- normal neurological exam afterward
- no evidence of intracranial infection or history of previous non-febrile seizures
- often positive family history of febrile seizures
- relatively well-looking after seizure

Investigations and Management

- if it is a febrile seizure: treat fever and look for source of fever
- if not a febrile seizure: treat seizure and look for source of seizure
  - note: may also have fever but may not meet criteria for febrile seizure
  - ± EEG (especially if first seizure), head U/S (if fontanelle open)

Red Flags for Abdominal Pain
- Significant weight loss or growth retardation (need growth chart)
- Fever
- Joint pain with objective physical findings
- Rash
- Rectal bleeding
- Rebound tenderness and radiation of pain to back, shoulders, or legs
- Pain wakes from sleep
- Severe diarrhea and encopresis
# Child Abuse and Neglect

- see Pediatrics, P14
- obligation to report any suspected/known case of child abuse or neglect to CAS yourself (do not delegate)
- document injuries
- consider skeletal survey x-rays (especially in non-ambulatory child), ophthalmology consult, CT head
- injury patterns associated with child abuse
  - HI: torn frenulum, dental injuries, bilateral black eyes, traumatic hair loss, diffuse severe CNS injury, retinal hemorrhage
  - Shaken Baby Syndrome: diffuse brain injury, subdural/SAH, retinal hemorrhage, minimal/no evidence of external trauma, associated bony fractures
  - skin injuries: bites, bruises/burns in shape of an object, glove/stocking distribution of burns, bruises of various ages, bruises in protected areas
  - bone injuries: rib fractures without major trauma, femur fractures age <1 yr, spiral fractures of long bones in non-ambulatory children, metaphyseal fractures in infants, multiple fractures of various ages, complex/multiple skull fractures
  - GU/GI injuries: chronic abdominal/perineal pain, injury to genitals/rectum, STI/pregnancy, recurrent vomiting or diarrhea

## Presentation of Neglect
- Failure to thrive, developmental delay
- Inadequate or dirty clothing, poor hygiene
- Child exhibits poor attachment to parents

## Procedures that may Require Sedation
- Setting fractures
- Reducing dislocations
- Draining abscesses
- Exploring wounds/ulcers/superficial infections
- Endoscopic examination
- Reduce patient anxiety/agitation for imaging/procedures

## Common Medications

**Basic Anatomy Review**

**Major Endocrine Organs**

**HYPOTHALAMUS**
- Corticotropin-RH (CRH)
- Gonadotropin-RH (GnRH)
- Thyrotropin-RH (TSH)
- Growth hormone-RH (GHRH)
- Antidiuretic hormone (ADH)*
- Oxytocin*

**THYROID GLAND**
- Triiodothyronine (T3)
- Thyroxine (T4)

**ADRENAL GLAND**
- Cortex
  - Aldosterone
  - Cortisol
  - Androgens
  - Medulla
  - Catecholamines

**TESTES**
- Testosterone

**PITUITARY GLAND**
- Anterior pituitary
  - Growth hormone (GH)
  - Thyroid-stimulating hormone (TSH)
  - Follicle-stimulating hormone (FSH)
  - Luteinizing hormone (LH)

- Posterior pituitary
  - Antidiuretic hormone (ADH)*
  - Oxytocin*

**PARATHYROID GLANDS**
- Parathyroid hormone (PTH)

**PANCREAS**
- Insulin
- Glucagon

**OVARIES**
- Estrogen
- Progesterone

*ADH and oxytocin are produced in the hypothalamus and stored in the posterior pituitary gland.

**Figure 1. Endocrine system**

**Dyslipidemias**

**Definition**
- Metabolic disorders characterized by elevations of fasting plasma LDL-cholesterol, and/or triglycerides (TG), and/or low HDL-cholesterol

**Overview of Lipid Transport**
- Lipoproteins are spherical complexes that consist of a lipid core surrounded by a shell of water-soluble cholesterol, apoproteins, and phospholipids
- Lipoproteins transport lipids within the body
- Apolipoproteins serve as enzyme co-factors, promote clearance of the particle by interacting with cellular receptors, and stabilize the lipoprotein micelle
Table 1. Lipoproteins

SECONDARY HYPERTRIGLYCERIDEMIA

Etiology
- endocrine: obesity/metabolic syndrome, hypothyroidism (more for high LDL, not TG), acromegaly, Cushing’s syndrome, DM
- renal: chronic renal failure, polyclonal and monoclonal hypergammaglobulinemia
- hepatic: chronic liver disease, hepatitis, glycogen storage disease
- drugs: alcohol, corticosteroids, estrogen, hydrochlorothiazide, retinoic acid, β-blockers without intrinsic sympathomimetic action (ISA), anti-retroviral drugs, atypical antipsychotics, oral contraceptive pills
- other: pregnancy

</tr>
</tbody>
</table>
Dyslipidemia and the Risk for Coronary Artery Disease

- increased LDL is a major risk factor for atherosclerosis and CAD as LDL is the major atherogenic lipid particle
- increased HDL is associated with decreased cardiovascular disease and mortality
- moderate hypertriglyceridemia (triglyceride level 2.3–9 mmol/L) is an independent risk factor for CAD, especially in people with DM and in post-menopausal women
- treatment of hypertriglyceridemia has not been shown to reduce CAD risk

Screening
- screen men over age 40, women over age 50 or post-menopausal
- if following risk factors present, screen at any age
  - DM
  - current cigarette smoking or COPD
  - HTN (sBP >140, dBP >90)
  - obesity (BMI >27 kg/m²)
  - family history of premature CAD
  - clinical signs of hyperlipidemia (xanthelasma, xanthoma, arcus cornealis)
  - evidence of atherosclerosis
  - inflammatory disease (rheumatoid arthritis, SLE, psoriatic arthritis, ankylosing spondylitis, inflammatory bowel disease)
  - HIV infection on highly active anti-retroviral therapy (HAART)
  - chronic kidney disease (estimated GFR <60 mL/min/1.73 m²)
  - erectile dysfunction
  - screen children with a family history of hypercholesterolemia or chylomicronemia

Factors Affecting Risk Assessment
- metabolic syndrome
- apolipoprotein B (apo B)
  - each atherogenic particle (VLDL, IDL, LDL, and lipoprotein A) contains one molecule of apo B
  - serum [apo B] reflects the total number of particles and may be useful in assessing cardiovascular risk and adequacy of treatment in high risk patients and those with metabolic syndrome
- C-reactive protein (hs-CRP) levels
  - highly sensitive acute phase reactant
  - may be clinically useful in identifying those at a higher risk of cardiovascular disease than predicted by the global risk assessment

Treatment of Dyslipidemias

Approach to Treatment
For clinical guidelines see Can J Cardiol 2012;28:151-167
- estimate 10 yr risk of CAD using Framingham model
- establish treatment targets according to level of risk

### Disorders of Glucose Metabolism

**Overview of Glucose Regulation**

- **Beta cells** of the pancreas stimulated to release insulin into the blood stream.
- Increased in blood glucose levels.
- Liver breaks down glycogen stores and releases glucose into the blood.
- **Insulin**
  - Body cells take up more glucose.
  - Liver takes up excess glucose and stores it as glycogen.
- **Glucagon**
  - Alpha cells of the pancreas stimulated to release glucagon into the blood.
  - Decrease in blood glucose levels.

**Pre-Diabetes (Impaired Glucose Tolerance/Impaired Fasting Glucose)**

- 1-5% per yr go on to develop DM.
- 50-80% revert to normal glucose tolerance.
- Weight loss may improve glucose tolerance.
- Increased risk of developing macrovascular complications (IGT > IFG).
- Lifestyle modifications decrease progression to DM by 58%.

**Diagnostic Criteria (CDA Guidelines)**

- Impaired fasting glucose (IFG): fasting blood glucose (FBG) 6.1-6.9 mmol/L.
- Impaired glucose tolerance (IGT): 2h 75 g oral glucose tolerance test (OGTT) 7.8-11.0 mmol/L.
- HbA1c: 6.0-6.4%.

**Indications:**
- Failed conservative measures
- TG >10 mmol/L (885 mg/dL) to prevent pancreatitis
- Combined hyperlipidemia
Diabetes Mellitus

Definition
- syndrome of disordered metabolism and inappropriate hyperglycemia secondary to an absolute/relative deficiency of insulin, or a reduction in biological effectiveness of insulin, or both

Diagnostic Criteria (CDA Guidelines)
- any one of the following is diagnostic
  - FPG ≥7.0 mmol/L (fasting = no caloric intake for at least 8 h) OR
  - 2h 75 g OGTT ≥11.1 mmol/L OR
  - random PG ≥11.1 mmol/L OR
  - HbA1c ≥6.5% (not for diagnosis of suspected Type 1 DM, children, adolescents, or pregnant women)
- in the presence of hyperglycemia symptoms (polyuria, polydipsia, polyphagia, weight loss, blurry vision), a confirmatory test is not required
- in the absence of hyperglycemic symptoms, a repeat confirmatory test is required to make the diagnosis of diabetes

Etiology and Pathophysiology

Table 7. Etiologic Classification of Diabetes Mellitus

| I. Type 1 DM (immune-mediated β cell destruction, usually leading to absolute insulin deficiency) |
| II. Type 2 DM (ranges from predominantly insulin resistance with relative insulin deficiency to a predominantly insulin secretory defect with insulin resistance 2nd to β cell dysfunction) |
| III. Other Specific Causes of DM a. Genetic defects of β cell function (e.g. MODY – Maturity-Onset Diabetes of the Young) or insulin action b. Diseases of the exocrine pancreas:  • Pancreatitis, pancreatectomy, neoplasia, cystic fibrosis, hemochromatosis (“bronze diabetes”) c. Endocrinopathies:  • Acromegaly, Cushing’s syndrome, glucagonoma, pheochromocytoma, hyperthyroidism d. Drug-induced:  • Glucocorticoids, thyroid hormone, β-adrenergic agonists, thiazides, phenytoin, clozapine e. Infections:  • Congenital rubella, CMV, coxsackie f. Genetic syndromes associated with DM:  • Down’s syndrome, Klinefelter’s syndrome, Turner’s syndrome |
| IV. Gestational Diabetes Mellitus (see Obstetrics, OB27) |

Blood Glucose Control in Type 2 DM – UKPDS 33
Lancet 1998;352:837-853
Study: RCT (mean follow-up 10 yr).
Patients: 3,867 patients with newly diagnosed type 2 DM (mean age 53 yr, 61% men, 81% white, mean fasting plasma glucose [FPG] 8.1-15.0 mmol/L).
Exclusions included severe cardiovascular disease, renal disease, retinopathy, and others.
Intervention: Intensive treatment with a sulfonylurea or insulin (target FPG <6 mmol/L) vs. conventional treatment with diet alone (target FPG <16 mmol/L without hyperglycemic symptoms).
Main Outcomes: DM-related endpoints (MI, angina, heart failure, stroke, renal failure, amputation, retinopathy, blindness, death from hyperglycemia or hypoglycemia), DM-related death, and all-cause mortality.
Results: Patients allocated to intensive treatment had lower median HbA1c levels (p<0.001).

Outcome | RRR % (p value)
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>DM-related endpoint</td>
<td>12 (0.029)</td>
</tr>
<tr>
<td>DM-related death</td>
<td>10 (0.34)</td>
</tr>
<tr>
<td>All-cause mortality</td>
<td>6 (0.44)</td>
</tr>
</tbody>
</table>

Patients allocated to intensive therapy had more hypoglycemic episodes and greater weight gain.
Conclusion: Intensive blood glucose control reduces microvascular but not macrovascular complications in type 2 DM.

**Conclusions**
- Targeting intensive glycemic control versus targeting conventional glycemic control for type 2 DM.
- Study: Systematic review of randomized clinical trials of intensive glycemic control in adults with type 2 DM.
- Patients: Twenty-two trials randomized 16,166 patients with type 2 DM to intensive control and 13,880 patients with type 2 DM to conventional glycemic control.
- Interventions: Intensive glycemic control (HbA1c <6.5%) versus conventional glycemic control (determined by local guidelines).
- Primary Outcome: All-cause mortality, cardiovascular mortality, and mishap.
- Results: There was no significant difference between targeting intensive and conventional glycemic control.
- Conclusions: Intensive glycemic control may not reduce all-cause mortality and cardiovascular mortality compared to conventional glycemic control. Intensive glycemic control reduced the risk of microvascular complications, while increasing the risk of hypoglycemia. Intensive glycemic control may also reduce the risk of non-fatal MI in trials exclusively dealing with glycemic control in usual care settings.

**Cardiovascular Effects of Intensive Lifestyle Intervention in Type 2 DM: The Look AHEAD Trial**

- Study: ICT, with 9.6 yr of median follow-up.
- Population: 5,145 overweight or obese patients with type 2 DM.
- Intervention: Intensive lifestyle intervention promoting weight loss through decreased caloric intake and increased physical activity (intervention) or DM support and education (control).
- Primary Outcome: First occurrence of death from cardiovascular (CV) cause, non-fatal MI, non-fatal stroke, or hospitalization for angina.
- Results: Although the intensive lifestyle intervention produced greater weight loss and reductions in glycated hemoglobin, the intervention did not significantly reduce the risk of CV morbidity or mortality.
- Conclusions: An intensive lifestyle intervention focusing on weight loss did not significantly reduce the rate of cardiovascular events in overweight or obese adults with type 2 DM.

**Treatment of Diabetes**

- **Glycemic Targets**
  - HbA1c reflects glycemic control over 3 mo and is a measure of patient’s long-term glycemic control.
  - In most individuals with type 1 or type 2 DM (especially younger patients) should be targeted to achieve a HbA1c ≤7.0% in order to reduce the risk of microvascular and if implemented early in the course of disease, macrovascular complications.
  - More intensive glucose control, HbA1c <6.5%, may be targeted in patients with a shorter duration of DM with no evidence of significant CVD and longer life expectancy, to further reduce risk of nephropathy and retinopathy, provided this does not result in a significant increase in hypoglycemia.
  - Less stringent HbA1c targets (7.1-8.5%) may be more appropriate in type 1 and type 2 patients with limited life expectancy, higher level of functional dependency, a history of recurrent severe hypoglycemia, multiple comorbidities, extensive CAD, or a failure to attain HbA1c <7.0% despite intensified basal and bolus insulin therapy.
  - There may be harm associated with strategy to target HbA1c <6.0% (see ACCORD trial, E9).

- **Diet**
  - Daily carbohydrate intake 45-60% of energy, protein 15-20% of energy, and fat <35% of energy.
  - Intake of saturated fats <7% and polyunsaturated fats <10% of total calories each.
  - Limit sodium, alcohol, and caffeine intake.
  - Type 1: Carbohydrate counting is used to titrate insulin regimen.
  - Type 2: Weight reduction.

- **Natural History**
  - After initial presentation, honeymoon period often occurs where glycemic control can be achieved with little or no insulin treatment as residual cells are still able to produce insulin.
  - Once these cells are destroyed, there is complete insulin deficiency.
  - Early on, glucose tolerance remains normal despite insulin resistance as β cells compensate with increased insulin production.
  - As insulin resistance and compensatory hyperinsulinism continue, the β cells are unable to maintain the hyperinsulinemic state which results in glucose intolerance and DM.

- **Risk Factors**
  - Personal history of other autoimmune diseases, including Graves’, myasthenia gravis, autoimmune thyroid disease, celiac disease, and pernicious anemia.
  - Family history of autoimmune diseases.
  - Age > 40 yr.
  - Abdominal obesity/overweight.
  - First-degree relative with DM.
  - Race/ethnicity (Black, Aboriginal, Hispanic, Asian-American, Pacific Islander).
  - Hx of IGT or IIS.
  - HTN.
  - Dyslipidemia.
  - Medications e.g. 2nd generation antipsychotics.
  - PCOS.
  - Hx of gestational DM or macrosomic baby (>9 lb or 4 kg).

- **Screening**
  - Subclinical prodrome can be detected in first and second-degree relatives of those with type 1 DM by the presence of pancreatic islet autoantibodies.

- Conclusions: An intensive lifestyle intervention focusing on weight loss did not significantly reduce the rate of cardiovascular events in overweight or obese adults with type 2 DM.

**Treatment of Diabetes**

- **Glycemic Targets**
  - HbA1c reflects glycemic control over 3 mo and is a measure of patient’s long-term glycemic control.
  - Therapy in most individuals with type 1 or type 2 DM (especially younger patients) should be targeted to achieve a HbA1c ≤7.0% in order to reduce the risk of microvascular and if implemented early in the course of disease, macrovascular complications.
  - More intensive glucose control, HbA1c <6.5%, may be targeted in patients with a shorter duration of DM with no evidence of significant CVD and longer life expectancy, to further reduce risk of nephropathy and retinopathy, provided this does not result in a significant increase in hypoglycemia.
  - Less stringent HbA1c targets (7.1-8.5%) may be more appropriate in type 1 and type 2 patients with limited life expectancy, higher level of functional dependency, a history of recurrent severe hypoglycemia, multiple comorbidities, extensive CAD, or a failure to attain HbA1c <7.0% despite intensified basal and bolus insulin therapy.
  - There may be harm associated with strategy to target HbA1c <6.0% (see ACCORD trial, E9).

- **Diet**
  - Daily carbohydrate intake 45-60% of energy, protein 15-20% of energy, and fat <35% of energy.
  - Intake of saturated fats <7% and polyunsaturated fats <10% of total calories each.
  - Limit sodium, alcohol, and caffeine intake.
  - Type 1: Carbohydrate counting is used to titrate insulin regimen.
  - Type 2: Weight reduction.
**Medical Treatment: Oral Antihyperglycemic Agents and/or Incretin Therapy (Type 2 DM)**
- initiate oral antihyperglycemic therapy and/or incretin therapy within 2-3 mo if lifestyle management does not result in glycemic control
- if HbA1c >8.5%, initiate pharmacologic therapy immediately and consider combination oral therapy or insulin immediately
- continue to add additional pharmacologic therapy in a timely fashion to achieve target HbA1C within 3-6 months of diagnosis
- see Common Medications, E52 for details on antihyperglycemic agents

**Medical Treatment: Insulin (Figure 5)**
- used for type 1 DM at onset, may be used in type 2 DM at any point in treatment
- routes of administration: subcutaneous injections, continuous subcutaneous insulin infusion pump, IV infusion (regular insulin only)
- bolus insulins: short-acting (Insulin regular), rapid-acting analogue (Insulin aspart, Insulin lispro, Insulin glulisine)
- basal insulins: intermediate-acting (Insulin NPH), long-acting analogue (Insulin detemir, Insulin glargine)
- premixed insulins (combination of basal and bolus insulins) available but not used regularly
- estimated total daily insulin requirement: 0.5-0.7 units/kg (often start with 0.3-0.5 units/kg/d)

**Effects of Intensive Glucose Lowering in Type 2 DM: The ACCORD Trial**
*NEJM 2010;362:1563-1574*

**Study:** Multicentre RCT  
**Patients:** 10,251 patients (mean age 62.2) with type 2 DM, and cardiovascular risk factors.  
**Intervention:** Intensive therapy targeting a HbA1c level of less than 6.0% or standard therapy targeting 7.0-7.9%.  
**Outcomes:** First occurrence of nonfatal MI, nonfatal stroke, or death from CV causes.  
**Results:** The intensive therapy arm was stopped early (3.5 yr vs. 5.6 yr planned) due to evidence of increased mortality. There was no difference in primary outcome for either study arm. There was a significant increase in all-cause mortality, CV mortality, nonfatal MI, and CHF in the intensive therapy group. There were increased rates of all hyperglycemic events, any nonhyperglycemic serious adverse events, fluid retention, and weight gain >10 kg, but lower systolic and diastolic blood pressure in the intensive therapy group. There was an increased incidence of elevated ALT (>3 times upper limit) and ACE drug use in the standard therapy group.  
**Conclusions:** Intensive glucose lowering therapy in type 2 DM does not improve clinic outcomes and actually increases the risk of mortality with more adverse events compared to standard therapy. Additional research is required to discern the cause.

**Effects of Intensive Blood Pressure Control in Type 2 DM: The ACCORD Trial**
*NEJM 2010;362:1575-1585*

**Study:** RCT, unblinded with 4.7 yr of mean follow-up  
**Population:** 4,733 patients with type 2 DM, risk factors for cardiovascular (CV) disease, systolic blood pressure (sBP) between 130-180 mmHg.  
**Intervention:** sBP control less than 120 mmHg (intensive) or 140 mmHg (standard).  
**Primary Outcomes:** Major CV event (composite nonfatal MI, nonfatal stroke, or CV-related death).  
**Results:** Mean number of medications at 1 yr for intensive therapy was 3.4 (95% CI 3.4-3.5) versus 2.1 (95% CI 2.1-2.2) for standard therapy. There was a significant increase in all serious adverse events in the intensive treatment arm (3.2% vs. 1.2%, p<0.001); especially bradycardia or arrhythmia (0.9% vs. 0.13%, p=0.02) and hyperkalemia (0.4% vs. 0.04%, p=0.01). There was no significant difference in primary outcomes in the two study arms, or all-cause mortality. There was a significant reduction in any stroke (0.32%/yr vs. 0.53%/yr, p=0.01) and nonfatal stroke incidences (0.30%/yr vs. 0.47%/yr, p=0.03) in the intensive therapy arm.  
**Conclusions:** Intensive BP lowering to less than 120 mmHg vs. 140 mmHg in patients with type 2 DM and CV risk factors does not reduce major CV event risk reduction except for stroke events.

**Effects of Combination Lipid Therapy in Type 2 DM: The ACCORD Trial**
*NEJM 2010;362:1583-1594*

**Study:** RCT, double blinded trial with 4.7 yr of mean follow-up  
**Population:** 5,518 patients with type 2 DM.  
**Intervention:** Statin with or without fibrate therapy.  
**Primary Outcome:** Major cardiovascular (CV) event (composite nonfatal MI, nonfatal stroke, or CV-related death).  
**Results:** No significant differences in primary outcome between the two arms. No difference in all MI, all stroke, or all-cause mortality between study arms.  
**Conclusions:** The addition of fibrate therapy to statin therapy in patients with type 2 DM does not reduce major CV event risk.

- Basal insulin to prevent fluctuations in blood sugar levels or long periods of hyperglycemia
- Antihyperglycemic agents (e.g. sitagliptin, saxagliptin, linagliptin) that inhibit DPP-IV, which is an enzyme that degrades endogenous incretin hormones like GLP-1
- Incretin hormones stimulate glucose-dependent insulin secretion and inhibit glucagon release from the pancreas
- DPP-IV Inhibitors
- GLP-1 Analogues (Incretins)
- Human glucagon-like peptide-1 analogues: exenatide, liraglutide
- These activate GLP-1 causing increased insulin secretion, decreased inappropriate glucagon secretion, increased B-cell growth/replication, slowed gastric emptying, and decreased food intake
- Associated with weight loss
- Subcutaneous formulation

**Variable Insulin Dose Schedule (“Sliding/Supplemental/Correction Scale”)**

- For patients on Basal-Bolus MDI regimen: patient takes usual doses of basal insulin but varies doses of bolus insulin based on BG reading at time of dose
- Use baseline bolus insulin dose when within BG target range; add or subtract units when above or below target
- When used in hospital (including perioperative management of DM) patient should also receive basal insulin to prevent fluctuations in blood sugar levels or long periods of hyperglycemia

**Figure 6. Duration of activity of different insulins**

**Effect of Mediterranean Diet in Preventing Cardiovascular Events in Type 2 DM: The PREDIMED Trial**

*NEJM* 2013;368:1279-1300

**Methods:** Investigators randomized 7,447 patients with type 2 DM or other high cardiovascular risk factors to Mediterranean diet supplemented with extra-virgin olive oil, Mediterranean diet supplemented with mixed nuts, or control diet with advice to reduce dietary fat.

**Primary Outcome:** Major cardiovascular (CV) event (MI, stroke, or death from CV causes).

**Results:** Both Mediterranean diets were associated with a reduced incidence of major CV events compared to the control diet.

**Conclusion:** A Mediterranean diet with extra-virgin olive oil or nuts reduces rates of MI, stroke, and CV death in those at high risk for CV disease.

**The 8 Is Precipitating DKA**

- Infection
- Ischemia or Infarction
- Iatrogenic (glucocorticoids)
- Intoxication
- Insulin overdose
- Initial presentation
- Intra-abdominal process (e.g. pancreatitis, cholecystitis)
- Intraoperative/perioperative stress
• construction of a supplemental sliding scale for a patient on anti-hyperglycemics
  ▪ Correction Factor (CF) = 100/Total Daily Dose of insulin (TDD)
  ▪ BG <4: call MD and give 15 g carbohydrates
  ▪ BG between 4 to 8: no additional insulin
  ▪ BG between 8 to (8 + CF): give one additional unit
  ▪ BG between (8 + CF) to (8 + 2CF): give two additional units
  ▪ BG between (8 + 2CF) to (8 + 3CF): give three additional units

**Insulin Pump Therapy: Continuous Subcutaneous Insulin Infusion (CSII)**
• external battery-operated device provides continuous basal dose of rapid-acting insulin analogue (aspart, glulisine, or lispro) through small subcutaneous catheter
• at meals, patient programs pump to deliver insulin bolus
• provides improved quality of life and flexibility
• risk of DKA if pump is inadvertently disconnected
• coverage available for insulin pumps for individuals with Type 1 DM varies by province

### Acute Complications

| Metabolic acidosis with \( \uparrow \) AG, possible 2\(^{nd}\) respiratory alkalosis | Metabolic acidosis absent unless underlying precipitant leads to acidosis (e.g. lactic acidosis in MI) |
| If severe vomiting/dehydration there may be a metabolic alkalosis | |

| Urine | | |
| \( \uparrow \) ve for glucose and ketones | -ve for ketones unless there is starvation ketosis |
| Glycosuria | | |
Laboratory Testing: Ketones
The nitroprusside test for ketones identifies acetone and acetoacetate but does NOT detect β-hydroxybutyrate (BHB), the ketone most frequently in excess. This has two clinical consequences:
• Be wary of a patient with a clinical picture of DKA but negative serum or urinary ketones. These could be false negatives because of the presence of BHB.
• As DKA is treated, BHB is converted to acetone and acetoacetate. Serum or urinary ketones may therefore rise, falsely suggesting that the patient is worsening when in fact they are improving.

</tr>
</tbody>
</table>

**Macrovascular Complications**
- increased risk of CAD, ischemic stroke, and peripheral arterial disease secondary to accelerated atherosclerosis
- CAD (see Cardiology and Cardiac Surgery, C26)
  - risk of MI is 3-5x higher in those with DM compared to age-matched controls
  - CAD is the leading cause of death in type 2 DM
  - most patients with DM are considered “high risk” under the risk stratification for CAD (see Dyslipidemias, E2)
- ischemic stroke (see Neurology, N50)
  - risk of stroke is approximately 2.5x higher in those with DM
  - level of glycemia is both a risk factor for stroke and a predictor of a poorer outcome in patients who suffer a stroke
  - HbA1c level is a significant and independent predictor of the risk of stroke
- peripheral arterial disease (see Vascular Surgery, VS2)
  - manifested by intermittent claudication in lower extremities, intestinal angina, foot ulceration
  - risk of foot gangrene is 30x higher in those with DM compared to age-matched controls
  - risk of lower extremity amputation is 15x higher in those with DM
- treatment
  - tight blood pressure control (<130/80 mmHg); especially for stroke prevention
  - tight glycemic control in early DM without established CVD (refer to ACCORD, VADT, ADVANCE, DCCT, EDIC, UKPDS extension studies)
  - tight low density lipoprotein (LDL) cholesterol control (LDL ≤2.0 mmol/L)
  - ACEI or angiotensin receptor blocker in high-risk patients
  - smoking cessation

**Prognosis**
- 2-5% mortality in developed countries
- Serious morbidity from sepsis, hypokalemia, respiratory complications, thromboembolic complications, and cerebral edema (the latter in children)
- Overall mortality approaches 50% primarily because of the older patient population and underlying etiology/precipitant

Average fluid loss runs at 3-6 L in DKA, and 8-10 L in HHS
Microvascular Complications

DIABETIC RETINOPATHY (see Ophthalmology, OP35 for a more detailed description)

Epidemiology
- type 1 DM: 25% affected at 5 yr, 100% at 20 yr
- type 2 DM: 25% affected at diagnosis, 60% at 20 yr
- leading cause of blindness in North America between the ages of 20-74
- most important factor is disease duration

Clinical Features
- nonproliferative
- preproliferative
- proliferative

Treatment and Prevention
- tight glycemic control (delays onset, decreases progression), tight lipid control, manage HTN, smoking cessation
- ophthalmological treatments available – see Ophthalmology, OP36 for more details
- annual follow-up visits with an optometrist or ophthalmologist examination through dilated pupils whether symptomatic or not (immediate referral after diagnosis of type 2 DM; 5 yr after diagnosis of type 1 DM)
- interval for follow-up should be tailored to severity of retinopathy

DIABETIC NEPHROPATHY (see Nephrology, NP30 for a more detailed description)

Epidemiology
- DM-induced renal failure is the most common cause of renal failure in North America
- 20-40% of persons with type 1 DM (after 5-10 yr) and 4-20% with type 2 DM have progressive nephropathy

Screening
- serum creatinine
- random urine test for albumin to creatinine ratio (ACR) plus urine dipstick test for all type 2 DM patients at diagnosis, then annually, and for postpubertal type 1 DM patients with ≥5 yr duration of DM

Treatment and Prevention
- appropriate glycemic control
- appropriate blood pressure control (<130/80 mmHg)
- use either ACEI or ARB (often used first line for their CVD protection)
- limit use of nephrotoxic drugs and dyes

DIABETIC NEUROPATHY

Epidemiology
- approximately 50% of patients within 10 yr of onset of type 1 DM and type 2 DM

Pathophysiology
- can have peripheral sensory neuropathy, motor neuropathy, or autonomic neuropathy
- mechanism poorly understood
- acute cranial nerve palsies and diabetic amyotrophy are thought to be due to ischemic infarction of peripheral nerve
- the more common motor and sensory neuropathies are thought to be related to metabolic or osmotic toxicity secondary to increased sorbitol and/or decreased myoinositol (possible mechanisms include accumulation of advanced glycation endproducts [AGE], oxidative stress, protein kinase C, nerve growth factor deficiency)

Screening
- 128 Hz tuning fork or 10 g monofilament at diagnosis and annually in people with type 2 DM and after 5 yr duration of type 1 DM
Clinical Features

Table 13. Clinical Presentation of Diabetic Neuropathies

<table>
<thead>
<tr>
<th>Peripheral Sensory Neuropathy</th>
<th>Motor Neuropathy</th>
<th>Autonomic Neuropathy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Paresthesias (tingling, itching), neuropathic pain, radicular pain, numbness, decreased tactile sensation</td>
<td>Less common than sensory neuropathy</td>
<td>Postural hypotension, tachycardia, decreased cardiovascular response to Valsalva maneuver</td>
</tr>
<tr>
<td>Bilateral and symmetric with decreased perception of vibration and pain/temperature; especially true in the lower extremities but may also be present in the hands</td>
<td>Delayed motor nerve conduction and muscle weakness/atrophy</td>
<td>Gastroparesis and alternating diarrhea and constipation</td>
</tr>
<tr>
<td>Decreased ankle reflex</td>
<td>May involve one nerve trunk (mononeuropathy) or more (mononeuritis multiplex)</td>
<td>Urinary retention and erectile dysfunction</td>
</tr>
<tr>
<td>Symptoms may first occur in entrapment syndromes e.g. carpal tunnel</td>
<td>Some of the motor neuropathies spontaneously resolve after 6-8 wk</td>
<td></td>
</tr>
<tr>
<td>May result in neuropathic ulceration of foot</td>
<td>Reversible CN palsies: III (ptosis/ophthalmoplegia, pupil sparing), VI (inability to laterally deviate eye), and VII (Bell’s palsy)</td>
<td></td>
</tr>
</tbody>
</table>

Treatment and Management
- tight glycemic control
- for neuropathic pain syndromes: tricyclic antidepressants (e.g. amitriptyline), pregabalin, duloxetine, anti-epileptics (e.g. carbamazepine, gabapentin), and capsaicin
- foot care education
- Jobst® fitted stocking and tilting of head of bed may decrease symptoms of orthostatic hypotension
- treat gastroparesis with domperidone and/or metoclopramide (dopamine antagonists), medical, mechanical, and surgical treatment for erectile dysfunction (see Urology, U30)

Other Complications

Dermatologic
- diabetic dermopathy: atrophic brown spots commonly in pre-tibial region known as “skin spots”, secondary to increased glycosylation of tissue proteins or vasculopathy
- eruptive xanthomas secondary to increased triglycerides
- necrobiosis lipoidica diabeticorum: rare complication characterized by thinning skin over the hands

Bone and Joint Disease
- juvenile cheiroarthropathy: chronic stiffness of hand caused by contracture of skin over joints secondary to glycosylated collagen and other connective tissue proteins
- Dupuytren’s contracture
- bone demineralization: bone density 10-20% below normal
- adhesive capsulitis (“frozen shoulder”)

Cataracts
- subcapsular and senile cataracts secondary to glycosylated lens protein or increased sorbitol causing osmotic change and fibrosis

Infections
- see Infectious Diseases, ID15

Hypoglycemia (BG <4.0 mmol/L or 72 mg/dL)

Etiology and Pathophysiology
- hypoglycemia occurs most frequently in people with DM receiving insulin or certain antihyperglycemic therapies (insulin secretagogues)
- in people without DM, care must be taken to distinguish fasting from post-prandial hypoglycemia as each invokes separate differential diagnoses

Other Players in Glucose Homeostasis
- Glucagon
- Epinephrine
- Cortisol
- Growth hormone

C-Peptide
- A short peptide released into the circulation when proinsulin is cleaved into insulin

</tbody>
</table>

Clinical Features
- Whipple’s triad
  1. serum glucose <2.5 mmol/L in males and <2.2 mmol/L in females
  2. neuroglycopenic symptoms
  3. rapid relief provided by administration of glucose
- adrenergic symptoms (typically occur first; caused by autonomic nervous system activity)
  - palpitations, sweating, anxiety, tremor, tachycardia
- neuroglycopenic symptoms (caused by decreased activity of CNS)
  - dizziness, headache, clouding of vision, mental dullness, fatigue, confusion, seizures, coma

Investigations
do-electrolytes, creatinine, LFTs, drugs/toxins, cortisol
-if concerned about possible insulinoma
  - blood work to be drawn when patient is hypoglycemic (e.g. during hospitalized 72-h fast) for glucose, serum ketones, insulin, pro-insulin, C-peptide, insulin antibodies

Treatment
- for fasting hypoglycemia, must treat underlying cause
- for post-prandial (reactive) hypoglycemia, frequent small feeds
- see Emergency Medicine, ER35
- treatment of hypoglycemic episode in the unconscious patient or patient NPO
  - D50W 50 mL (1 ampule) IV or 1 mg glucagon SC (if no IV available)
  - may need ongoing glucose infusion once BG >5 mmol/L

Metabolic Syndrome
- several definitions exist
- postulated syndrome related to insulin resistance associated with hyperglycemia, hyperinsulinemia, HTN, central obesity, and dyslipidemia
- obesity aggravates extent of insulin resistance
- complications include DM, atherosclerosis, CAD, MI, and stroke
- women with PCOS are at increased risk for developing insulin resistance, hyperlipidemia, and metabolic syndrome
- not to be confused with syndrome X related to angina pectoris with normal coronary arteries (Prinzmetal angina)

Obesity
- see Family Medicine, FM7
**Pituitary Gland**

**Pituitary Hormones**

- **Hypothalamic Control of Pituitary**
  - trophic and inhibitory factors control the release of pituitary hormones
  - most hormones are primarily under trophic stimulation except prolactin which is primarily under inhibitory control by dopamine, as well as GH and TSH which are inhibited by SS (somatostatin)
  - transection of the pituitary stalk (i.e. dissociation of hypothalamus and pituitary) leads to pituitary hypersecretion of prolactin and hyposecretion of all remaining hormones

- **Anterior Pituitary Hormones**
  - growth hormone (GH), luteinizing hormone (LH), follicle stimulating hormone (FSH), thyroid stimulating hormone (TSH), adrenocorticotropic hormone (ACTH), and prolactin (PRL)

- **Posterior Pituitary (Hypothalamic) Hormones**
  - antidiuretic hormone (ADH) and oxytocin
  - peptides synthesized in the supraoptic and paraventricular nuclei of the hypothalamus
  - although ADH and oxytocin are produced in the hypothalamus these hormones are stored and released from the posterior pituitary

**Table 15. The Physiology and Action of Pituitary Hormones**

</table>

**Growth Hormone**

**GH DEFICIENCY**
- cause of short stature in children (see Pediatrics, P27)
- controversial significance in adults; often not clinically apparent, may present as fatigue

**GH EXCESS**
- in children (before epiphyseal fusion) leads to gigantism
- in adults (after epiphyseal fusion) leads to acromegaly

**Etiology**
- GH secreting pituitary adenoma, carcinoid or pancreatic islet tumours secreting ectopic GHRH resulting in excess GH

**Pathophysiology**
- normally GH is a catabolic hormone that acts to increase blood glucose levels
- in growth hormone excess states secretion remains pulsatile but there is loss of hypoglycemic stimulation, glucose suppression, and the nocturnal surge
- proliferation of bone, cartilage, soft tissues, organomegaly
- insulin resistance and IGT

**Clinical Features**
- enlargement of hands and feet, coarsening of facial features, thickening of calvarium, prognathism, thickening of skin, increased sebum production, sweating, acne, sebaceous cysts, fibromata mollusca, acanthosis nigricans, arthralgia, carpal tunnel syndrome, degenerative osteoarthritis, barrel chest, thyromegaly, renal calculi, HTN, cardiomyopathy, obstructive sleep apnea, colonic polyps, erectile dysfunction, menstrual irregularities, and DM

**Risks Associated with GH Excess**
- Cardiac disease (e.g. CAD, cardiomegaly, cardiomyopathy) in 1/3 of patients, with a doubling of risk of death from cardiac disease
- HTN in 1/3 of patients
- Risk of cancer (particularly GI) increased 2-fold to 3-fold

**Signs and Symptoms of Acromegaly**
- ABCDEF
  - Arthralgia/Arthritis
  - Blood pressure raised
  - Carpal tunnel syndrome
  - DM
  - Enlarged organs
  - Field defect (visual)
Investigations
- elevated serum insulin-like growth factor-1 (IGF-1) is usually the first line diagnostic test
- glucose suppression test is the most specific test (75 g of glucose PO suppresses GH levels in healthy individuals but not in patients with acromegaly)
- CT, MRI, or skull x-rays may show cortical thickening, enlargement of the frontal sinuses, and enlargement and erosion of the sella turcica
- MRI of the sella turcica is needed to look for a tumour

Treatment
- surgery, octreotide (somatostatin analogue), dopamine agonist (bromocriptine/cabergoline), growth hormone receptor antagonist (pegvisomant), radiation

Prolactin

HYPERPROLACTINEMIA

Etiology
- pregnancy and breastfeeding
- prolactinoma: most common pituitary adenoma (prolactin-secreting tumours may be induced by estrogens and grow during pregnancy)
- pituitary masses with pituitary stalk compression causing reduced dopamine inhibition of prolactin release
- primary hypothyroidism (increased TRH)
- decreased clearance due to chronic renal failure or severe liver disease (prolactin is metabolized by both the kidney and liver)
- medications with anti-dopaminergic properties are a common cause of high prolactin levels: antipsychotics (common), antidepressants, anti-hypertensives, anti-migraine agents (triptans/ergotamines), bowel motility agents (metoclopramide/domperidone), H2-blockers (ranitidine)
- macroprolactinemia (high molecular weight prolactin also known as big big prolactin)

Clinical Features
- galactorrhea (secretion of breast milk in women and, in rare cases, men), infertility, hypogonadism, amenorrhea, erectile dysfunction

Investigations
- serum PRL, TSH, liver enzyme tests, creatinine
- MRI of the sella turcica

Treatment
- long-acting dopamine agonist: bromocriptine, cabergoline, or quinagolide (Norprolac®)
- surgery ± radiation (rare)
- prolactin-secreting tumours are very slow-growing and sometimes require no treatment
- if medication-induced, consider stopping medication if possible
- in certain cases if microprolactinoma and not planning on becoming pregnant, may consider OCP

Thyroid Stimulating Hormone

• see Thyroid, E20

Adrenocorticotropic Hormone

• see Adrenal Cortex, E29

Luteinizing Hormone and Follicle Stimulating Hormone

HYPOGONADOTROPIC HYPOGONADISM

Clinical Features
- hypogonadism, amenorrhea, erectile dysfunction (see Urology, U30), loss of body hair, fine skin, testicular atrophy, failure of pubertal development

Treatment
- Pergonal® (combined FSH/LH hormone therapy), hCG, rFSH, or pulsatile GnRH analogue if fertility desired
- symptomatic treatment with estrogen/testosterone

Approach to Nipple Discharge
- Differentiate between galactorrhea (fat droplets present) versus breast discharge (usually unilateral, may be bloody or serous)
- If galactorrhea, determine if physiologic (e.g. pregnancy, lactation, stress) versus pathologic
- If abnormal breast discharge, must rule out a breast malignancy
HYPERGONADOTROPIC HYPOGONADISM
- 2º hypersecretion in gonadal failure (e.g. in menopause)

Antidiuretic Hormone

DIABETES INSIPIDUS

Definition
- disorder of ineffective ADH (decreased production or peripheral resistance) resulting in passage of large volumes of dilute urine

Etiology and Pathophysiology
- central DI: insufficient ADH due to pituitary surgery, tumours, idiopathic/autoimmune, stalk lesion, histiocytosis X, trauma, familial central DI
- nephrogenic DI: collecting tubules in kidneys resistant to ADH due to drugs (e.g. lithium), hypercalcemia, hypokalemia, chronic renal disease, hereditary nephrogenic DI
- psychogenic polydipsia and osmotic diuresis must be ruled out

Clinical Features
- passage of large volumes of dilute urine, polydipsia, and dehydration; hypernatremia can develop with inadequate water consumption or secondary to an impaired thirst mechanism

Diagnostic Criteria
- fluid deprivation will differentiate true DI (high urine output persists, urine osmolality < plasma osmolality) from psychogenic DI (psychogenic polydipsia)
- response to exogenous ADH (DDAVP) will distinguish central from nephrogenic DI

Treatment
- DDAVP/vasopressin for central DI
- chlorpropamide, clofibrate, thiazides, NSAIDs, or carbamazepine as second line or for partial DI
- nephrogenic DI treated with solute restriction NSAIDs and thiazide diuretics; DDAVP (if partial)

SYNDROME OF INAPPROPRIATE ADH SECRETION

Diagnostic Criteria
- hyponatremia with corresponding plasma hypo-osmolality, urine sodium concentration above 40 mEq/L, urine less than maximally diluted (>100 mOsm/kg), euvolemia (edema absent), and absence of adrenal, renal, or thyroid insufficiency

Etiology and Pathophysiology
- stress (pain, nausea, post-surgical)
- malignancy (lung, pancreas, lymphoma)
- CNS disease (inflammatory, hemorrhage, tumour, Guillain-Barré syndrome)
- respiratory disease (TB, pneumonia, empyema)
- drugs (SSRIs, vincristine, chlorpropamide, cyclophosphamide, carbamazepine, nicotine, morphine, DDAVP, oxytocin)

Treatment
- treat underlying cause, fluid restriction (800-1000 mL/day), vasopressin receptor antagonists (e.g. tolvaptan, conivaptan), and demeclocycline (antibiotic with anti-ADH properties, rarely-used) fluoroecortisone, furosemide

Pituitary Pathology

PITUITARY ADENOMA (see Neurosurgery, NS19)

Clinical Features
- local mass effects
  - visual field defects (bitemporal hemianopsia due to compression of the optic chiasm), diplopia (due to oculomotor nerve palsies), headaches; increased ICP is rare
  - hypofunction
    - hypopituitarism
  - hyperfunction
    - PRL (galactorrhea), GH (acromegaly in adults, gigantism in children), ACTH (Cushing’s disease = Cushing’s syndrome caused by a pituitary tumour)
    - tumours secreting LH, FSH, and TSH are rare

Important Deficiencies to Recognize
- Adrenal insufficiency
- Hypothyroidism

Concurrent adrenal insufficiency and hypothyroidism should be treated with glucocorticoids first and then with thyroid hormone to avoid adrenal crisis.
Investigations
- radiological evaluation (MRI is imaging procedure of choice)
- formal visual field testing
- hypothalamic-pituitary hormonal function

HYPOPITUITARISM

**Etiology (The Eight Is)**
- Invasive
  - pituitary tumours, craniopharyngioma, cysts (Rathke's cleft, arachnoid, or dermoid), metastases
- Infarction/hemorrhage
  - Sheehan's syndrome (pituitary infarction due to excessive post-partum blood loss and hypovolemic shock)
  - pituitary apoplexy (acute hemorrhage/infarction of a pituitary tumour; presents with sudden loss of pituitary hormones, severe headache, and altered level of consciousness; can be fatal if not recognized and treated early)
- Infiltrative/inflammatory
  - sarcoidosis, hemochromatosis, histiocytosis
- Infectious
  - syphilis, TB, fungal (histoplasmosis), parasitic (toxoplasmosis)
- Injury
  - severe head trauma
- Immunologic
  - autoimmune destruction
- Iatrogenic
  - following surgery or radiation
- Idiopathic
  - familial forms, congenital midline defects

**Investigations**
- triple bolus test
  - stimulates release of all anterior pituitary hormones in normal individuals
  - rapid sequence of IV infusion of insulin, GnRH, and TRH
  - insulin (usual dose 0.1 unit/kg of human regular insulin) → hypoglycemia → increased GH and ACTH/cortisol
  - GnRH (100 µg IV push) → increased LH and FSH
  - TRH (200 µg IV push over 120 s) → increased TSH and PRL (no longer available in Canada)

**Thyroid**

**Thyroid Hormones**

![Figure 8. Thyroid hormone synthesis](https://example.com/image.jpg)

© Stefania Spano 2012

DIT = diiodotyrosine; L = lysosome; MIT = monoiodotyrosine; TG = thyroglobulin; T3 = triiodothyronine; T4 = thyroxine (tetraiodothyronine); TP = thyroid peroxidase enzyme

Order they are usually lost with compression by a mass:
“Go Look For The Adenoma Please”
GH, LH, FSH, TSH, ACTH, PRL + posterior pituitary hormones: ADH and oxytocin
Synthetic Function of Thyroid Gland

- the synthesis of thyroid hormones T₄ (thyroxine) and T₃ (triiodothyronine) by the thyroid gland involves trapping and oxidation of iodide, iodination of thyroglobulin, and release of T₃ and T₄
- free T₄ (0.03%) and free T₃ (0.3%) represent the hormonally active fraction of thyroid hormones
  - the remaining fraction is bound to thyroxine binding globulin (TBG) and albumin and is biologically inactive
- T₄ is more biologically active (3-8x more potent), but T₄ has a longer half-life
- 83% of T₄ is converted to T₃ or reverse T₃ (rT₃) in the periphery by deiodinases
- rT₃ is metabolically inactive but produced in times of stress to decrease metabolic activity
- most of the plasma T₄ pool is derived from the peripheral conversion of T₃
- calcitonin, a peptide hormone, is also produced in the thyroid, by the parafollicular cells or C cells
  - it functions by inhibiting osteoclast activity and increasing renal calcium excretion

Role of Thyroid Hormones

- thyroid hormones act primarily through modifying gene transcription by binding to nuclear receptors
- action of these hormones is diffuse, effecting nearly every organ system
- they produce an increase in basal metabolic rate including: increased Na⁺/K⁺ ATPase activity, increased O₂ consumption, increased respiration, heat generation, and increased cardiovascular activity
- they also play crucial role during fetal life in both neurological and somatic development

Regulation of Thyroid Function

- extrathyroid
  - stimulation of thyroid by TSH, epinephrine, prostaglandins (cAMP stimulators)
  - T₃ negatively feeds back on anterior pituitary to inhibit TSH and on hypothalamus to inhibit TRH
- intrathyroid (autoregulation)
  - synthesis (Wolff-Chaikoff effect, Jod-Basedow effect)
  - there is varying thyroid sensitivity to TSH in response to iodide availability
  - increased ratio of T₃ to T₄ in iodide deficiency
  - increased activity of peripheral 5’ deiodinase in hypothyroidism increases T₃ production despite low T₄ levels

Tests of Thyroid Function and Structure

TSH

- sensitive TSH (sTSH) is the best test for assessing thyroid function
- hyperthyroidism
  - primary: TSH is low because of negative feedback from increased levels of circulating T₃ and T₄
  - secondary: increased TSH results in increased T₃ and T₄
- hypothyroidism
  - primary: increased TSH (most sensitive test) because of less negative feedback from T₃ and T₄
  - secondary: TSH is low or normal with variable response to TRH depending on the site of the lesion (pituitary or hypothalamic)

Free T₃ and Free T₄

- standard assessment of thyroid function measures TSH and if necessary free T₄. Free T₃ should only be measured in the small subset of patients with hyperthyroidism and suspected T₃ toxicity. TSH would be suppressed, free T₄ normal, and free T₃ elevated

Thyroid Autoantibodies

- anti-thyroglobulin antibodies (TgAb), anti-thyroid peroxidase antibodies (TPOAb), anti-TSH receptor antibodies (TRAb) of the blocking variety
  - increased in Hashimoto’s disease; normal variant in 10-20% of individuals
  - anti-TSH receptor antibodies (TRAb) of the stimulating variety are also referred to as thyroid stimulating immunoglobulins (TSI)
  - increased in Graves’ disease

Plasma Thyroglobulin

- used to monitor for residual thyroid tissue post-thyroidectomy, e.g. tumour marker for thyroid cancer recurrence
- normal or elevated levels may suggest persistent, recurrent, or metastatic disease

Serum Calcitonin

- not routinely done to investigate thyroid nodules
- ordered if suspicion of medullary thyroid carcinoma or family history of MEN IIa or IIb syndromes
  - used to monitor for residual or recurrent medullary thyroid cancer

Thyroid Imaging/Scans
- normal gland size 15-20 g (estimated by palpation)
- thyroid U/S
  - to measure size of gland, solid vs. cystic nodule, facilitate fine needle aspirate biopsy (FNAB)
- radioactive iodine scan (Technetium-99)
  - test of structure: order if there is a thyroid nodule and patient is hyperthyroid with low TSH
  - differentiates between hot (functioning → excess thyroid hormone production) and cold (non-functioning) nodules
  - hot nodule → very low chance malignancy; treat hyperthyroidism
  - cold nodule → ~5% chance malignancy; further workup required (U/S and FNAB)
- radioactive iodine uptake (RAIU)
  - test of function: order if patient is thyrotoxic
  - RAIU measures the turnover of iodine by thyroid gland in vivo
  - if ↑ uptake (i.e. incorporated) → gland is overactive (hyperthyroidism)
  - if ↓ uptake (i.e. not incorporated) → gland is leaking thyroid hormone (e.g. thyroiditis), exogenous thyroid hormone use, or excess iodine intake (e.g. amiodarone or contrast dye, which has high iodine content)
- see Figure 9, Approach to the Evaluation of a Thyroid Nodule, E29 for further information regarding the utility of these scans

Thyroid Biopsy
- fine needle aspiration (FNA) for cytology
- differentiates between benign and malignant disease
- best done under U/S guidance
- accuracy decreased if nodule is greater than 50% cystic, or if nodule located posteriorly in the gland

Thyrotoxicosis

Definition
- clinical, physiological, and biochemical findings in response to elevated thyroid hormone

Epidemiology
- 1% of general population have hyperthyroidism
- F:M = 5:1

Etiology and Pathophysiology

Caution with Amiodarone
Amiodarone-Induced Hypothyroidism (AIH): AIH occurs more often in iodine-sufficient areas, and is more common in populations with a higher prevalence of autoimmune thyroid disease, such as women and the elderly. AIH can also occur in patients without pre-existing thyroid dysfunction.

Amiodarone-Induced Thyrotoxicosis (AIT): AIT occurs more often in iodine-deficient areas. It may occur in patients with pre-existing thyroid deficiencies, as an iodine load on an already dysfunctional thyroid may result in excessive thyroid hormone synthesis and release. AIT may also occur in patients without thyroid abnormalities through a cytotoxic mechanism that results in leakage of thyroid hormone into the systemic circulation.

Signs and Symptoms of HYPERthyroidism
- Tremor
- Heart rate up
- Yawning (fatigued)
- Restlessness
- Oligomenorrhea/amenorrhea
- Intolerance to heat
- Diarrhea
- Irritability
- Sweating
- Muscle wasting/weight loss

Clinical Features

Table 18. Clinical Features of Thyrotoxicosis

| General                                | Fatigue, heat intolerance, irritability, fine tremor |
| CVS                                    | Tachycardia, atrial fibrillation, palpitations       |
| GI                                     | Weight loss with increased appetite, thirst, increased frequency of bowel movements (hyperdefecation) |
| Neurology                              | Proximal muscle weakness, hypokalemic periodic paralysis (more common in Asians) |
| GU                                     | Oligomenorrhea, amenorrhea, decreased fertility      |
| Dermatology                            | Fine hair, skin moist and warm, vitiligo, soft nails with onycholysis (Plummer's nails), palmar erythema, pruritis   |
|                                         | Graves' disease: clubbing (acropachy), pretibial myxedema (rare) |
| MSK                                    | Decreased bone mass, proximal muscle weakness        |
| Hematology                             | Graves' disease: leukopenia, lymphocytosis, splenomegaly, lymphadenopathy (occasionally) |
| Eye                                    | Graves' disease: lid lag, retraction, proptosis, diplopia, decreased acuity, puffiness, conjunctival injection |

Treatment
- thionamides: PTU or MMI; MMI recommended (except in first trimester pregnancy)
- $\beta$-blockers for symptom control
- radioactive iodine thyroid ablation for Graves' disease
- surgery in the form of hemi, sub-total, or complete thyroidectomy

Graves' Disease

Definition
- an autoimmune disorder characterized by autoantibodies to the TSH receptor that leads to hyperthyroidism

Epidemiology
- most common cause of thyrotoxicosis
- occurs at any age with peak in 3rd and 4th decade
- $F:M = 7:1$, 1.5-2% of U.S. women
- familial predisposition: 15% of patients have a close family member with Graves' disease and 50% have family members with positive circulating antibodies
- association with HLA B8 and DR3
- may be associated with other inherited autoimmune disorders (e.g. pernicious anemia, Hashimoto's disease)

Etiology and Pathophysiology
- autoimmune disorder due to a defect in T-suppressor cells
- B lymphocytes produce TSI that binds and stimulates the TSH receptor and stimulates the thyroid gland
- immune response can be triggered by postpartum state, iodine excess, lithium therapy, viral or bacterial infections, glucocorticoid withdrawal
- ophthalmopathy (thyroid associated orbitopathy) a result of increased tissue volume due to inflammation and accumulation of glycosaminoglycans, stimulated by TSI, that increase osmotic pressure within the orbit; this leads to fluid accumulation and displacement of the eye ball forward
- dermopathy may be related to cutaneous glycosaminoglycan deposition

Graves' Ophthalmopathy

NO SPECS (in order of changes usually)
- No signs
- Only signs: lid lag, lid retraction
- Soft tissue: periocular puffiness, conjunctival injection, chemosis
- Proptosis/exophthalmos
- Extraocular (diplopia)
- Corneal abrasions (since unable to close eyes)
- Sight loss
Clinical Features
• signs and symptoms of thyrotoxicosis
  - diffuse thyroid goitre ± thyroid bruit secondary to increased blood flow through the gland
  - ophthalmopathy: proptosis, diplopia, conjunctival injection, corneal abrasions, periorbital puffiness, lid lag, decreased visual acuity if Graves’ (plus signs of hyperthyroidism: lid retraction, characteristic stare)
  - dermopathy (rare): pretibial myxedema (thickening of dermis that manifests as non-pitting edema)
  - acropachy: clubbing and thickening of distal phalanges

Investigations
• low TSH
• increased free T₄ (and/or increased T₃)
• positive for TSI
• increased radioactive iodine (I-131) uptake
• homogeneous uptake on thyroid scan (only do this test in the presence of nodule)

Treatment
• thionamides
  - propylthiouracil (PTU) or methimazole (MMI)
  - inhibit thyroid hormone synthesis by inhibiting peroxidase-catalyzed reactions, thereby inhibiting organification of iodide, blocking the coupling of iodotyrosines
  - PTU also inhibits peripheral deiodination of T₄ to T₃
  - continue treatment until remission occurs (20-40% of patients achieve spontaneous remission at 6-18 mo of treatment)
• small goitre and recent onset are good indicators for long-term remission with medical therapy
• major side effects: hepatitis, agranulocytosis, and fever/arthritis
• minor side effects: rash
• iodinated contrast agents: sodium ipodate and iopanoic acid can inhibit conversion of T₄ to T₃ and are especially effective in combination with MMI
• MMI preferred vs. PTU due to longer duration of action (once daily for most), more rapid efficacy, and lower incidence of side effects
• MMI contraindicated in pregnancy (teratogenic), use PTU
• symptomatic treatment with β-blockers
• thyroid ablation with radioactive ¹³¹I if PTU or MMI trial does not produce disease remission
  - high incidence of hypothyroidism after ¹³¹I requiring lifelong thyroid hormone replacement
  - contraindicated in pregnancy
  - may worsen ophthalmopathy
• subtotal or total thyroidectomy (indicated rarely for large goitres, suspicious nodule for CA, if patient is intolerant to thionamides and refusing RAI ablation)
• risks include hypoparathyroidism and vocal cord palsy
• ophthalmopathy/orbitopathy
• smoking cessation is most important
• prevent drying
• high dose prednisone in severe cases
• orbital radiation, surgical decompression

Prognosis
• course involves remission and exacerbation unless gland is destroyed by radioactive iodine or surgery
• lifetime follow-up needed
• risk of relapse is 37%, 21%, 6% in thionamides, radioiodine ablation, and surgery groups, respectively

Subacute Thyroiditis (Thyrotoxic Phase)
Definition
• acute inflammatory disorder of the thyroid gland characterized by an initial thyrotoxic state followed by hypothyroidism eventually followed by euthyroidism in most cases
• two subtypes: painful and painless

Etiology and Pathophysiology
• acute inflammation of the thyroid gland characterized by giant cells and lymphocytes
• disruption of thyroid follicles by inflammatory process results in the release of stored hormone rather than excessive production of new thyroid hormone
• painful = viral (usually preceded by URTI), De Quervain’s (granulomatous thyroiditis)
• painless = postpartum, auto-immune, lymphocytic
  - occurs in 5-10% of postpartum mothers and is symptomatic in 1/3 of patients
**Clinical Features**
- two forms
  - painful (“De Quervain’s”) thyroid, ears, jaw, and occiput
  - painless (“Silent”)
- fever and malaise may be present, especially in De Quervain’s
- postpartum: thyrotoxicosis 2-3 mo postpartum with a subsequent hypothyroid phase at 4-8 mo postpartum
- may be mistakenly diagnosed as postpartum depression

**Laboratory Investigations**
- initial elevated free T₄, T₃, low TSH, RAIU markedly reduced
- marked elevation of ESR in painful variety only
- as disease progresses values consistent with hypothyroidism may appear

**Treatment**
- painful – high dose NSAIDs, prednisone may be required for severe pain, fever, or malaise
- iodinated contrast agents (e.g. iopanoic acid, ipodate) to inhibit peripheral conversion of T₄ to T₃
- β-adrenergic blockade is usually effective in reversing most of the hypermetabolic and cardiac symptoms in both subtypes
- if symptomatically hypothyroid, may treat short-term with thyroxine

**Prognosis**
- full recovery in most cases, but permanent hypothyroidism in 10% of painless thyroiditis
- postpartum: most resolve spontaneously without need for supplementation, however may recur with subsequent pregnancies

---

**Toxic Adenoma/Toxic Multinodular Goitre**

**Etiology and Pathophysiology**
- autonomous thyroid hormone production from a functioning adenoma that is hypersecreting T₃ and T₄
- may be singular (toxic adenoma) or multiple (toxic multinodular goitre [Plummer’s disease])

**Clinical Features**
- goitre with adenomatous changes
- tachycardia, heart failure, arrhythmia, weight loss, nervousness, weakness, tremor, and sweats
- seen most frequently in elderly people, often with presentation of atrial fibrillation

**Investigations**
- low TSH, high T₃ and T₄
- thyroid scan with increased uptake in nodule(s) and suppression of the remainder of the gland

**Treatment**
- initiate therapy with PTU or MMI to attain euthyroid state
- use high dose radioactive iodine (I-131) to ablate hyperfunctioning nodules
- β-blockers often necessary for symptomatic treatment prior to definitive therapy
- surgical excision may also be used as 1st line treatment

---

**Thyrotoxic Crisis/Thyroid Storm**

**Definition**
- acute exacerbation of all of the symptoms of thyrotoxicosis presenting in a life-threatening state secondary to uncontrolled hyperthyroidism – medical emergency!
- rare, but serious with mortality rate between 10-30%

**Etiology and Pathophysiology**
- often precipitated by infection, trauma, or surgery in a hyperthyroid patient

**Differential Diagnosis**
- sepsis, pheochromocytoma, malignant hyperthermia, drug overdose, neuroleptic malignant syndrome

**Clinical Features**
- hyperthyroidism
- extreme hyperthermia (≥40°C), tachycardia, vomiting, diarrhea, vascular collapse, hepatic failure with jaundice, and confusion
- tachyarrhythmia, CHF, shock
- mental status changes ranging from delirium to coma
Laboratory Investigations
- increased free T₃ and T₄, undetectable TSH
- ± anemia, leukocytosis, hyperglycemia, hypercalcemia, elevated LFTs

General Measures
- fluids, electrolytes, and vasopressor agents should be used as indicated
- a cooling blanket and acetaminophen can be used to treat the pyrexia
- propranolol or similar agents for β-adrenergic blockade is used, which additionally causes decreased peripheral conversion of T₄ to T₃
- use with caution in CHF patients as it may worsen condition

Specific Measures
- PTU is the anti-thyroid drug of choice and is used in high doses
- Give iodide, which acutely inhibits the release of thyroid hormone, one hour after the first dose of PTU is given
  - Sodium iodide 1 g IV drip over 12h q12h
  - Lugol’s solution 2-3 drops q8h
  - Potassium iodide (SSKI) 5 drops q8h
- dexamethasone 2-4 mg IV q6h for the first 24-48 hours lowers body temperature and inhibits peripheral conversion of T₄ to T₃

Prognosis
- probably <20% mortality rate if rapidly recognized and treated

Hypothyroidism

Definition
- clinical syndrome caused by cellular responses to insufficient thyroid hormone production

Epidemiology
- 2-3% of general population
- F:M = 10:1
- 10-20% of women over age 50 have subclinical hypothyroidism (normal T₄, TSH mildly elevated)
- iodine deficiency most common cause worldwide, but not in North America

Etiology and Pathophysiology
- primary hypothyroidism (90%)
  - inadequate thyroid hormone production secondary to intrinsic thyroid defect
  - iatrogenic: post-ablative (¹³¹I or surgical thyroidectomy)
  - autoimmune: Hashimoto’s thyroiditis, chronic thyroiditis, idiopathic, burnt out Graves’
  - hypothyroid phase of subacute thyroiditis
  - drugs: goitrogens (iodine), PTU, MMI, lithium
  - infiltrative disease (progressive systemic sclerosis, amyloid)
  - iodine deficiency
  - congenital (1/4,000 births)
  - neoplasia
- secondary hypothyroidism: pituitary hypothyroidism
  - insufficiency of pituitary TSH
- tertiary hypothyroidism: hypothalamic hypothyroidism
  - decreased TRH from hypothalamus (rare)
- peripheral tissue resistance to thyroid hormone (Refetoff syndrome)

![Thyroid Hormone Replacement for Subclinical Hypothyroidism](Cochrane DB Syst Rev 2007;3:CD003419)

**Purpose:** To assess the effects of thyroid hormone replacement for subclinical hypothyroidism.

**Study Selection:** RCTs comparing thyroid hormone replacement with placebo in adults with subclinical hypothyroidism. Minimum duration of follow-up was one month.

**Results:** No trial assessed cardiovascular mortality or morbidity. Seven studies evaluated symptoms, mood, and quality of life with no statistically significant improvement. One study showed a statistically significant improvement in cognitive function. Six studies assessed serum lipids, there was a trend for reduction in some parameters following levothyroxine replacement. Some echocardiographic parameters improved after levothyroxine replacement therapy, like myocardial relaxation. Only four studies reported adverse events with no statistically significant differences between groups.

**Conclusions:** In current RCTs, levothyroxine replacement therapy for subclinical hypothyroidism did not result in improved survival or decreased cardiovascular morbidity. Data on health-related quality of life and symptoms did not demonstrate significant differences between intervention groups. Some evidence indicates that levothyroxine replacement improves some parameters of lipid profiles and left ventricular function.

Treatment

- L-thyroxine (dose range: 0.05–0.2 mg PO OD ~1.6 µg/kg/d)
- elderly patients and those with CAD: start at 0.025 mg daily and increase gradually every 6 wk (start low, go slow)
- after initiating L-thyroxine, TSH needs to be evaluated in 6 wk; dose is adjusted until TSH returns to normal reference range
- once maintenance dose achieved, follow-up TSH with patient annually
- secondary/tertiary hypothyroidism
  - monitor via measurement of free T₄ (TSH is unreliable in this setting)

CONGENITAL HYPOTHYROIDISM

- see Pediatrics, P29

Hashimoto’s Thyroiditis

- most common form of primary hypothyroidism in North America
- chronic autoimmune thyroiditis characterized by both cellular and humoral factors in the destruction of thyroid tissue
- two major forms: goitrous and atrophic; both forms share same pathophysiology but differ in the extent of lymphocytic infiltration, fibrosis, and thyroid follicular cell hyperplasia
- goitrous variant usually presents with a rubbery goitre and euthyroidism, then hypothyroidism becomes evident
  - associated with fibrosis
- atrophic variant patients are hypothyroid from the start
  - associated with thyroid lymphoma

Etiology and Pathophysiology

- defect in clone of T-suppressors leads to cell-mediated destruction of thyroid follicles
- B lymphocytes produce antibodies against thyroid components including thyroglobulin, thyroid peroxidase, TSH receptor, Na⁺/I⁻ symporter

Risk Factors

- female gender
- genetic susceptibility: increased frequency in patients with Down’s syndrome, Turner’s syndrome, certain HLA alleles, cytotoxic T-lymphocyte-associated protein 4 (CTLA-4)
- family Hx or personal Hx of other autoimmune diseases
- cigarette smoking
- high iodine intake
- stress and infection

Investigations

- high TSH, low T₄ (not necessary to measure T₃, as it will be low as well)
- presence of anti-thyroid peroxidase (TPOAb) and anti-thyroglobulin antibodies (TgAb) in serum

Treatment

- if hypothyroid, replace with L-thyroxine (analog of T₄)
Myxedema Coma

Definition
- severe hypothyroidism complicated by trauma, sepsis, cold exposure, MI, inadvertent administration of hypnotics or narcotics, and other stressful events – medical emergency!
- rare, high level of mortality when it occurs (up to 40%, despite therapy)

Clinical Features
- hallmark symptoms of decreased mental status and hypothermia; hyponatremia, hypotension, hypoglycemia, bradycardia, hypoventilation, and generalized edema often present

Investigations
- decreased T₄, increased TSH, decreased glucose
- check ACTH and cortisol for evidence of adrenal insufficiency

Treatment
- aggressive treatment required
- ABCs: ICU admission
- corticosteroids (for risk of concomitant adrenal insufficiency): hydrocortisone 100 mg q8h
- L-thyroxine 0.2-0.5 mg IV loading dose, then 0.1 mg IV OD until oral therapy tolerated; also consider T₃ therapy
- supportive measures: mechanical ventilation, vasopressor drugs, passive rewarming, IV dextrose, fluids if necessary (risk of overload)
- monitor for arrhythmia

Sick Euthyroid Syndrome

Definition
- changes in circulating thyroid hormones amongst patients with serious illness, trauma, or stress
- not due to intrinsic thyroid or pituitary disease
- initially low free T₃ may be followed by low TSH and if severe illness low free T₄
- with recovery of illness, TSH may overshoot and become transiently high

Pathophysiology
- abnormalities include alterations in
  - peripheral transport and metabolism of thyroid hormone
  - regulation of TSH secretion
  - thyroid function itself
  - may be protective during illness by reducing tissue catabolism

Labs
- initially decreased free T₃ followed by decreased TSH and finally decreased free T₄

Treatment
- treat the underlying disease; thyroid hormone replacement worsens outcomes
- thyroid function tests normalize once patient is well (initially with a transient increase in TSH)

Non-Toxic Goitre

Definition
- generalized enlargement of the thyroid gland in a euthyroid individual that does not result from inflammatory or neoplastic processes

Pathophysiology
- the appearance of a goitre is more likely during adolescence, pregnancy, and lactation because of increased thyroid hormone requirements
  - early stages: goitre is usually diffuse
  - later stages: multinodular non-toxic goitre with nodule, cyst formation and areas of ischemia, hemorrhage, and fibrosis

Etiology
- iodine deficiency or excess
- goitrogens: brassica vegetables (e.g. turnip, cassava)
- drugs: iodine, lithium, para-aminosalicylic acid
- any disorder of hormone synthesis with compensatory growth
- peripheral resistance to thyroid hormone
Treatment
• remove goitrogens
• radiiodine therapy (need very high doses, low iodine uptake, used as last resort)
• suppression with L-thyroxine (rarely done)
• surgery may be necessary for severe compressive symptoms

Complications
• compression of neck structures causing stridor, dysphagia, pain, and hoarseness
• multinodular goitre may become autonomous leading to toxic multinodular goitre and hyperthyroidism

Thyroid Nodules

Definition
• clearly defined discrete mass, separated from the thyroid parenchyma
• palpable nodules are found in approximately 5% of women and 1% of men

Etiology
• benign tumours (e.g. colloid nodule, follicular adenoma)
• thyroid malignancy
• hyperplastic area in a multinodular goitre
• cyst: true thyroid cyst, area of cystic degeneration in a multinodular goitre

Investigations

Figure 9. Approach to the evaluation of a thyroid nodule
Adapted from Dr. J Goguen, University of Toronto, MMMD 2013

Thyroid Malignancies

• see Otolaryngology, OT38

Adrenal Cortex

Adrenocorticotropic Hormone

• a polypeptide (cleaved from prohormone POMC), secreted in a pulsatile fashion from the anterior pituitary with diurnal variability (peak: 0200-0400; trough: 1800-2400)
• secretion regulated by corticotropin-releasing hormone (CRH) and arginine vasopressin (AVP)
• stimulates growth of adrenal cortex and release of glucocorticoids, androgens and, to a limited extent, mineralocorticoids
• some melanocyte stimulating activity

Adrenocortical Hormones

Aldosterone
• a mineralocorticoid which regulates extracellular fluid (ECF) volume through Na⁺ (and Cl⁻) retention and K⁺ (and H⁺) excretion (stimulates distal tubule Na⁺/K⁺ ATPase)
• regulated by the renin-angiotensin-aldosterone system (Figure 12)
• negative feedback to juxtaglomerular apparatus (JGA) by long loop (aldosterone → volume expansion) and short loop (angiotensin II → peripheral vasoconstriction)
Figure 11. Pathways of major steroid synthesis in the adrenal gland and their enzymes

Cortisol
- a glucocorticoid, regulated by the HPA axis
- involved in regulation of metabolism; counteracts the effects of insulin
- support blood pressure, vasomotor tone
- also involved in regulation of behaviour and immunosuppression

Table 21. Physiological Effects of Glucocorticoids

</tbody>
</table>

Androgens
- sex steroids regulated by ACTH; primarily responsible for adrenarche (growth of axillary and pubic hair)
- principal adrenal androgens are dihydroepiandrosterone (DHEA), androstenedione, and 11-hydroxyandrostenedione
- proportion of total androgens (adrenal to gonadal) increases in old age
Adrenocortical Functional Workup

STIMULATION TEST
- purpose: diagnosis of hormone deficiencies
- method: measure target hormone after stimulation with tropic (pituitary) hormone

1. Tests of Glucocorticoid Reserve
- Cosyntropin (ACTH analogue) Stimulation Test
  - give 1 µg or 250 µg cosyntropin IV, then measure plasma cortisol levels at time 0, 30, and 60 min
  - physiologic response: stimulated plasma cortisol of >500 nmol/L
  - inappropriate response: inability to stimulate increased plasma cortisol
- insulin tolerance is the gold standard test used to diagnose adrenal insufficiency (see Pituitary Gland, E16)

SUPPRESSION TESTS
- purpose: diagnosis of hormone hypersecretion
- method: measure target hormone after suppression of its tropic (pituitary) hormone

1. Tests of Pituitary-Adrenal Suppressibility
- Dexamethasone (DXM) Suppression Test
  - principle: DXM suppresses pituitary ACTH → plasma cortisol should be lowered if HPA axis is normal
  - Screening Test: Overnight DXM Suppression Test
    - oral administration of 1 mg DXM at midnight → measure plasma cortisol levels the following day at 8 am
    - physiologic response: plasma cortisol <50 nmol/L, with 50-140 nmol/L being a “grey zone” (cannot be certain if normal or not)
    - inappropriate response: failure to suppress plasma cortisol
  - <20% false positive results due to obesity, depression, alcohol, other medications
  - Confirmatory Test: Other testing is used to confirm the diagnosis, such as:
    - 24 h urine free cortisol (shows overproduction of cortisol)
    - midnight salivary cortisol (if available), shows lack of diurnal variation
    - inappropriate response: remains high (normally will be low at midnight)

2. Tests of Mineralocorticoid Suppressibility
- principle: expansion of extracellular fluid volume (ECFV) → plasma aldosterone should be lowered if HPA axis were normal
- ECFV Expansion with Normal Saline (NS)
  - IV infusion of 500 mL/h of NS for 4 h → then measure plasma aldosterone levels
  - plasma aldosterone >277 pmol/L is consistent with primary hyperaldosteronism, <140 pmol/L is normal
  - inappropriate response: failure to suppress plasma aldosterone
Mineralocorticoid Excess Syndromes

**Definition**
- primary hyperaldosteronism (PH): excess aldosterone production (intra-adrenal cause)
- secondary hyperaldosteronism (SH): aldosterone production in response to excess RAAS (extra-adrenal cause)

**Etiology**
- primary hyperaldosteronism
  - aldosterone-producing adrenal adenoma (Conn's syndrome)
  - bilateral or idiopathic adrenal hyperplasia
  - glucocorticoid-remediable aldosteronism
  - aldosterone-producing adrenocortical carcinoma
  - unilateral adrenal hyperplasia
- secondary hyperaldosteronism

**Clinical Features**
- HTN
- hypokalemia (may have mild hyponatremia), metabolic alkalosis
- normal K⁺, low Na⁺ in SH (low effective circulating volume leads to ↑ ADH release) → edema
- increased cardiovascular risk: LV hypertrophy, atrial fibrillation, stroke, MI
- fatigue, weakness, paresthesia, headache; severe cases with tetany, intermittent paralysis

**Diagnosis**
- investigate plasma aldosterone to renin ratio in patients with HTN and hypokalemia
- confirmatory testing for PH: aldosterone suppression test (demonstrate inappropriate aldosterone secretion with ECFV expansion)
- imaging: CT adrenal glands

**Table 22. Diagnostic Tests in Hyperaldosteronism**

<td>A) Oral test</td>
<td>↑ urine aldosterone</td>
<td>Not performed if normal PAC/PRA</td>
</tr>
<tr>
<td>B) IV saline test</td>
<td>↑ plasma aldosterone</td>
<td></td>
</tr>
</tbody>
</table>

**Treatment**
- inhibit action of aldosterone: spironolactone, eplerenone, triamterene, amiloride (act on sodium channels)
- surgical excision of adrenal adenoma
- secondary hyperaldosteronism: treat underlying cause
**Cushing’s Syndrome**

**Definition**
- results from chronic glucocorticoid excess (endogenous or exogenous sources)

**Etiology**
- ACTH-dependent (85%) – bilateral adrenal hyperplasia and hypersecretion due to:
  - ACTH-secreting pituitary adenoma (Cushing’s disease; 80% of ACTH-dependent)
  - ectopic ACTH-secreting tumour (e.g. small cell lung carcinoma, bronchial, carcinoid, pancreatic islet cell, pheochromocytoma, or medullary thyroid tumours)
- ACTH-independent (15%)
  - long-term use of exogenous glucocorticoids
  - primary adrenocortical tumours: adenoma and carcinoma (uncommon)
  - bilateral adrenal nodular hyperplasia

**Clinical Features**
- symptoms: weakness, insomnia, mood disorders, impaired cognition, easy bruising, oligo-/amenorrhea, hirsutism, and acne (ACTH dependent)
- signs: central obesity, round face, supraclavicular and dorsal fat pads, facial plethora, proximal muscle wasting, purple abdominal striae, skin atrophy, acanthosis nigricans, HTN, hyperglycemia, osteoporosis, pathologic fractures, hyperpigmentation, hyperandrogenism if ACTH-dependent

**Diagnosis**
- complete a drug history to exclude iatrogenic Cushing’s
- perform one of: 1. 24 h urine free cortisol, 2. dexamethasone suppression test, or 3. late night salivary cortisol
- consider reasons for a false positive (e.g. pregnancy, depression, alcoholism, morbid obesity, poorly controlled DM)
- confirm with one of the remaining tests if necessary (do not rely on random cortisol, insulin tolerance, loperamide, or urinary 17-ketosteroid tests)

**Treatment**
- adrenal
  - adenoma: unilateral adrenalectomy (curative) with glucocorticoid supplementation post-operatively
  - carcinoma: adjunctive chemotherapy often not useful (frequent metastases, poor prognosis)
  - medical treatment: mitotane, ketoconazole to reduce cortisol
- pituitary
  - trans-sphenoidal resection, with glucocorticoid supplement post-operatively
- ectopic ACTH tumour (paraneoplastic syndrome): usually bronchogenic cancer (poor prognosis)
  - surgical resection, if possible; chemotherapy/radiation for primary tumour
  - agents blocking adrenal steroid synthesis: metyrapone or ketoconazole

**Congenital Adrenal Hyperplasia**
- see Pediatrics, P30

**Hyperandrogenism**

**Definition**
- state of having excessive secretion of androgens (DHEA, DHEA sulfate, testosterone)

**Etiology and Pathophysiology**

Clinical Features
Females
- hirsutism
  - male pattern growth of androgen-dependent terminal body hair in women: back, chest, upper abdomen, face, linea alba
  - Ferriman-Gallwey scoring system is used to quantify severity of hirsutism
- virilization
  - masculinization: hirsutism, temporal balding, clitoral enlargement, deepening of voice, acne
  - increase in musculature
- defeminization
  - loss of female secondary sex characteristics (i.e. amenorrhea, ↓ breast size, infertility)

Males
- minimal effects on hair, muscle mass, etc.
- inhibition of gonadotropin secretion may cause reduction in: testicular size, testicular testosterone production, and spermatogenesis

Investigations
- testosterone, DHEA-S as a measure of adrenal androgen production
- LH/FSH (commonly in PCOS >2.5)
- 17-OH progesterone, elevated in CAH due to 21-OH deficiency; check on day 3 of menstrual cycle with a progesterone level
- for virilization: CT/MRI of adrenals and ovaries (identify tumours)
- if PCOS, check blood glucose, lipids, 75 g OGTT

Treatment
- discontinue causative medications
- antiandrogens, e.g. spironolactone
- oral contraceptives (increase SHBG, which binds androgens>estrogens; reduce ovarian production of androgens)
- surgical resection of tumour
- low dose glucocorticoid ± mineralocorticoid if CAH suspected
- treat specific causative disorders, e.g. tumours, Cushing’s, etc.
- cosmetic therapy (laser, electrolysis)

Adrenocortical Insufficiency

Definition
- a state of inadequate cortisol and/or aldosterone production by the adrenal glands

Etiology

PRIMARY (ADDISON’S DISEASE)

Adapted from: Salvatori R. JAMA 2005;294:2481-2488

Treatment

- acute condition – can be life-threatening
  - IV NS in large volumes (2-3 L); add D5W if hypoglycemic from adrenal insufficiency
  - hydrocortisone 50-100 mg IV q6-8h for 24h, then gradual tapering
  - identify and correct precipitating factors
- maintenance
  - hydrocortisone 15-20 mg total daily dose, in 2-3 divided doses, highest dose in the AM
  - Florinef® (fludrocortisone, synthetic mineralocorticoid) 0.05-0.2 mg PO daily if mineralocorticoid deficient increase dose of steroids 2-3 fold for a few days during moderate-severe illness (e.g. with vomiting, fever)
  - major stress (e.g. surgery, trauma) requires 150-300 hydrocortisone IV daily divided into 3 doses
  - medical alert bracelet and instructions for emergency hydrocortisone/dexamethasone IM/SC injection

Adrenal Medulla

Catecholamine Metabolism

- catecholamines are synthesized from tyrosine in postganglionic sympathetic nerves (norepinephrine) and chromaffin cells of adrenal medulla (epinephrine)
- broken down into metanephrines and other metabolites (VMA, HVA) and excreted in urine

Pheochromocytoma

Definition

- rare catecholamine secreting tumour derived from chromaffin cells of the sympathetic system

Epidemiology

- most commonly a single tumour of adrenal medulla
- rare cause of HTN (<0.2% of all hypertensives)

Etiology and Pathophysiology

- most cases sporadic (80%)
- familial: associated with multiple endocrine neoplasia II (MEN IIA and IIB) (50% penetrance; i.e. 50% of people with the mutation get pheochromocytoma), von Hippel-Lindau (10-20% penetrance), paraganglioma (20% penetrance), or neurofibromatosis type 1 (0.1-5.7% penetrance)
- tumours, via unknown mechanism, able to synthesize and release excessive catecholamines
Clinical Features
• 50% suffer from paroxysmal HTN; the rest have sustained HTN
• classic triad (not found in most patients): episodic "pounding" headache, palpitations/tachycardia, diaphoresis
• other symptoms: tremor, anxiety, chest or abdominal pain, N/V, visual blurring, weight loss, polyuria, polydipsia
• other signs: orthostatic hypotension, papilledema, hyperglycemia, dilated cardiomyopathy
• symptoms may be triggered by stress, exertion, anesthesia, abdominal pressure, certain foods (especially tyramine containing foods)

Investigations
• urine catecholamines
  ▪ increased catecholamine metabolites (metanephrines) and free catecholamines
  ▪ plasma metanephrines if available (most sensitive)
  ▪ cut-off values will depend on assay used
• CT abdomen
  ▪ if negative, whole body CT and meta-iodo-benzoguanidine (MIBG) scintigraphy, Octreoscan, or MRI

Treatment
• surgical removal of tumour (curative) with careful pre- and post-operative ICU monitoring
• adequate pre-operative preparation
  ▪ α-blockade for BP control: doxazosin or calcium channel blockers (10-21 d pre-operative), IV phentolamine (perioperative, if required)
  ▪ β-blockade for HR control once α blocked for a few days
  ▪ metyrosine (catecholamine synthesis inhibitor) + phenoxybenzamine or prazosin
  ▪ volume restoration with vigorous salt-loading and fluids
• rescreen urine 1-3 mo post-operatively
• screen urine in first degree relatives; genetic testing in patients <50 yr old

Disorders of Multiple Endocrine Glands

Multiple Endocrine Neoplasm

• neoplastic syndromes involving multiple endocrine glands
• tumours of neuroectodermal origin
• autosomal dominant inheritance with variable penetrance
• genetic screening for RET proto-oncogene on chromosome 10 has long-term benefit in MEN II
  ▪ early cure and prevention of medullary thyroid cancer

</tbody>
</table>

Calcium Homeostasis

- normal total serum Ca$^{2+}$: 2.2-2.6 mmol/L
- ionic/free Ca$^{2+}$ levels: 1.15-1.31 mmol/L
- serum Ca$^{2+}$ is about 40% protein bound (mostly albumin), 50% ionized, and 10% complexed with PO43- and citrate
- regulated mainly by two factors: parathyroid hormone (PTH) and vitamin D
- actions mainly on three organs: GI tract, bone, and kidney
Table 27. Major Regulators in Calcium Homeostasis

Figure 15. Parathyroid hormone (PTH) regulation

**Hypercalcemia**

**Definition**
- total corrected serum Ca\(^{2+}\) >2.6 mmol/L OR ionized Ca\(^{2+}\) >1.35 mmol/L
- hypercalcemia often diagnosed incidentally

**Approach to Hypercalcemia**
1. Is the patient hypercalcemic? (correct for albumin – see sidebar)
2. Is the PTH high/normal or low?
3. If PTH is low, is phosphate high/normal or low? If phosphate is high/normal is the level of vitamin D metabolites high or low?
**Clinical Features**
- symptoms depend on the absolute Ca²⁺ value and the rate of its rise (may be asymptomatic)

**Table 28. Symptoms of Hypercalcemia**

</table>

**Hypercalcemic crisis (usually >4 mmol/L or 16 mg/dL):** primary symptoms include oliguria/anuria and mental status changes (including somnolence and eventually coma) → this is a medical emergency and should be treated immediately!

**Treatment**
- treatment depends on the Ca²⁺ level and the symptoms
- treat acute, symptomatic hypercalcemia aggressively
- treat the underlying cause of the hypercalcemia

**Figure 16. Differential diagnosis of hypercalcemia**

**Initial investigations:** PTH, PO₄³⁻, Mg²⁺, Urine Ca²⁺, creatinine

- Normal or ↑ PTH
  - Familiar Hypocalciuric Hypercalcemia (FHH): Ca²⁺ receptor gene defect
  - Primary Hyperparathyroidism: Solitary adenoma (81%) Carcinoma (15%) MEN I and Ila
  - Tertiary Hyperparathyroidism: Increased PTH after prolonged secondary hyperparathyroidism due to renal failure

- ↑ PTH (related to ↑ PTHrP)
  - Hypervitaminosis D: Excessive intake of Vit D or its metabolites
  - Low Vit D metabolites
  - Drugs: Lithium
  - Familial Hypocalciuric Hypercalcemia (FHH): Ca²⁺ receptor gene defect
  - Primary Hyperparathyroidism: Solitary adenoma (81%) Carcinoma (15%) MEN I and Ila
  - Tertiary Hyperparathyroidism: Increased PTH after prolonged secondary hyperparathyroidism due to renal failure

- ↓ PTH
  - Humoral mediation: Lung cancer, RCC, pheochromocytoma
  - Low Vit D metabolites
  - Drugs: theophylline, thiazide diuretics, estrogen/tamoxifen

**Corrected Ca²⁺ (mmol/L) = measured Ca²⁺ + 0.02 (40 – albumin)**

For every decrease in albumin by 10, increase in Ca²⁺ by 0.2
- Benign (less likely malignant): Ca²⁺ < 2.75 mmol/L
- Pathologic (more likely malignant): Ca²⁺ > 3.25 mmol/L

**The symptoms and signs of hypercalcemia include:**
- "Bones, stones, groans, and psychic overtones"

**The most common cause of hypercalcemia in hospital is malignancy-associated hypercalcemia**
- Usually occurs in the later stages of disease
- Most commonly seen in lung, renal, breast, ovarian, and squamous tumours, as well as lymphoma and multiple myeloma

**Mechanisms:**
- Secretion of parathyroid hormone-related protein (PTHrP) which mimics PTH action by preventing renal calcium excretion and activating osteoclast-induced bone resorption
- Cytokines in multiple myeloma
- Calcitriol production by lymphoma
- Osteolytic bone metastases direct effect
- Excess PTH in parathyroid cancer
Hypocalcemia

Definition
- total corrected serum Ca²⁺ <2.2 mmol/L.

Table 30. Clinical Features of Hypocalcemia

</tr>
</tbody>
</table>

Approach to Hypocalcemia
1. Is the patient hypocalcemic?
2. Is the PTH high or low?
3. If PTH is high, is phosphate low or normal?
4. Is the Mg²⁺ level low?

Approach to Treatment
- correct underlying disorder
- mild/asymptomatic (ionized Ca²⁺ >0.8 mmol/L)
  - treat by increasing dietary Ca²⁺ by 1000 mg/d
  - calcitriol 0.25 µg/d (especially in renal failure)
- acute/asymptomatic hypocalcemia (ionized Ca²⁺ <0.7 mmol/L)
  - immediate treatment required
  - IV calcium gluconate 1-2 g over 10-20 min followed by slow infusion if necessary
  - goal is to raise Ca²⁺ to low normal range (2.0-2.1 mmol/L) to prevent symptoms but allow maximum stimulation of PTH secretion
  - if PTH recovery not expected, requires long-term therapy with calcitriol and calcium
- do not correct hypocalcemia if asymptomatic and suspected to be transient

Differential Diagnosis of Hypercalcemia
• Primary hyperparathyroidism
• Malignancy: hematologic, humoral, skeletal metastases (>90% from 1 or 2)
• Renal disease: tertiary hyperparathyroidism
• Drugs: calcium carbonate, milk alkali syndrome, thiazide, lithium, theophylline, vitamin A/D intoxication
• Familial hypocalciuric hypercalcemia
• Granulomatous disease: sarcoidosis, TB, Hodgkin’s lymphoma
• Thyroid disease: thyrotoxicosis
• Adrenal disease: adrenal insufficiency, pheochromocytoma
• Immobilization

Watch Out for:
• Volume depletion via diuresis
• Arrhythmias

Acute Management of Hypercalcemia/ Hypercalcemic Crisis
• Volume expansion (e.g. NS IV 300-500 cc/h): initial therapy
• Calcitriol: transient, partial response
• Bisphosphonate: treatment of choice
• Corticosteroid: most useful in vit D toxicity, granulomatous disease, some malignancies
• Saline diuresis + loop diuretic (for volume overload): temporary measure

Hypomagnesemia can impair PTH secretion and action

Differential Diagnosis of Tetany
• Hypocalcemia
• Metabolic alkalosis (with hyperventilation)
• Hypokalemia
• Hypomagnesemia

Signs and Symptoms of Acute Hypocalcemia
• Paresthesia: perioral, hands, and feet
• Chvostek’s sign: percussion of the facial nerve just anterior to the external auditory meatus elicits ipsilateral spasm of the orbicularis oculi or orbicularis oris muscles
• Trouseau’s sign: inflation of a blood pressure cuff above systolic pressure for 3 min elicits carpal spasm and paresthesia

Transient hypoparathyroidism (resulting in hypocalcemia) common after subtotal thyroidectomy (permanent in <3% of surgeries)
Hyperphosphatemia

Definition
- serum phosphate >1.45 mmol/L
- critical role in the development of secondary hyperparathyroidism and renal osteodystrophy in patients with advanced CKD and on dialysis

Table 31. Etiology of Hyperphosphatemia

</tbody>
</table>

Clinical Features
- non-specific, include ectopic calcification, renal osteodystrophy

Treatment
- acute: hemodialysis if symptomatic
- chronic: low PO₄³⁻ diet, phosphate binders (e.g. CaCO₃ or lanthanum carbonate with meals)

Hypophosphatemia

Definition
- serum phosphate <0.85 mmol/L

Table 32. Etiology of Hypophosphatemia

</tr>
</tbody>
</table>

Symptoms usually present when phosphate <0.32 mmol/L (1.0 mg/dL)
Treat asymptomatic patients if phosphate <0.64 mmol/L (2.0 mg/dL)
Severe burns can cause hypophosphatemia due to PO₄³⁻ losses through the skin
Clinical Features
• non-specific (CHF, coma, hypotension, weakness, defective clotting)

Treatment
• treat underlying cause
  • Oral PO₄³⁻: 2-4 g/d divided bid-qid (start at 1 g/d to minimize diarrhea)
  • IV PO₄³⁻: only for severely symptomatic patients or inability to tolerate oral therapy

Hypermagnesemia

Definition
• serum magnesium >0.85 mmol/L

Etiology
• AKI/CRF
• Mg²⁺-containing antacids or enemas
• IV administration of large doses of MgSO₄ (e.g. for preeclampsia; see Obstetrics, OB25)

Clinical Features
• rarely symptomatic
• drowsiness, hyporeflexia, respiratory depression, heart block, cardiac arrest, hypotension

Treatment
• discontinue Mg²⁺-containing products
• IV calcium (Mg²⁺-antagonist) for acute reversal of magnesium toxicity
• dialysis if renal failure

Hypomagnesemia

Definition
• serum magnesium <0.70 mmol/L

Etiology
• GI losses
  • starvation/malabsorption
  • vomiting/diarrhea
  • alcoholism
  • acute pancreatitis
• excess renal loss
  • 2° hyperaldosteronism due to cirrhosis and CHF
  • hyperglycemia
  • hypokalemia
  • hypercalcemia
  • loop and thiazide-type diuretics
  • nephrotoxic medications
  • proton-pump inhibitors

Clinical Features
• seizures, paresis, Chvostek and Trousseau signs, ECG changes (widened QRS, prolonged PR, T-wave abnormalities), and arrhythmias including Torsades de pointes

Treatment
• treat underlying cause
• oral Mg²⁺ salts unless patients have seizures or other severe symptoms
• Mg²⁺ IM/IV; cellular uptake of Mg²⁺ is slow, therefore repletion requires sustained correction
• discontinue diuretics
  • in patients requiring diuretics, use a K⁺-sparing diuretic to minimize magnesuria

Metabolic Bone Disease

Osteoporosis

Definition
• a condition characterized by decreased bone mass and microarchitectural deterioration of bone tissue with a consequent increase in bone fragility and susceptibility to fracture
• bone mineral density (BMD) ≥2.5 standard deviations below the peak bone mass for young adults (i.e. T-score ≤−2.5)
• osteopenia: BMD with T-score between -1.0 and -2.5

ETIOLOGY AND PATHOPHYSIOLOGY

Primary Osteoporosis (95% of osteoporosis in women & 80% in men)
• primary type 1: most common in post-menopausal women, due to decline in estrogen, worsens with age
• primary type 2: occurs after age 75, seen in females and males at 2:1 ratio, possibly due to zinc deficiency

Online Clinical Tools
CAROC
www.osteoporosis.ca/multimedia/pdf/CAROC.pdf
FRAX
www.shef.ac.uk/FRAX/tool.aspx
Secondary Osteoporosis
• gastrointestinal diseases
  ° gastrectomy
  ° malabsorption (e.g. celiac disease)
  ° chronic liver disease
• bone marrow disorders
  ° multiple myeloma
  ° lymphoma
  ° leukemia
• endocrinopathies
  ° Cushing’s syndrome
  ° hyperparathyroidism
  ° hyperthyroidism
  ° premature menopause
  ° DM
  ° hypogonadism
• malignancy
  ° secondary to chemotherapy
  ° myeloma

Clinical Features
• commonly asymptomatic
• height loss due to collapsed vertebrae
• fractures: most commonly in hip, vertebrae, humerus, and wrist
  ° fragility fractures: fracture with fall from standing height
  ° Dowager’s hump: collapse fracture of vertebral bodies in mid-dorsal region
  ° x-ray: vertebral compression and crush fractures, wedge fractures, “codfish” sign

Approach to Osteoporosis
1. Assess risk factors for osteoporosis on history and physical
2. Decide if patient requires BMD testing with dual-energy x-ray absorptiometry (DEXA): men
3. Initial investigations
  • all patients with osteoporosis: calcium corrected for albumin, CBC, creatinine, ALP, TSH
  • also consider serum and urine protein electrophoresis, celiac workup, and 24 h urinary Ca2+

4. Assess 10-yr fracture risk by combining BMD result and risk factors (only if ≥50 yr)
5. For all patients being assessed for osteoporosis, encourage appropriate lifestyle changes
(see Table 35)

Before prescribing Calcitonin, remember to ask about fish allergies.
Osteomalacia and Rickets

- **rickets**: osteopenia with disordered calcification leading to a higher proportion of osteoid (unmineralized) tissue prior to epiphyseal closure (in childhood)
- **osteomalacia**: osteopenia with disordered calcification leading to a higher proportion of osteoid (unmineralized) tissue after epiphyseal closure (in adulthood)

**Etiology and Pathophysiology**

**Vitamin D Deficiency**
- deficient uptake or absorption
  - nutritional deficiency
  - malabsorption: post-gastrectomy, small bowel disease (e.g. Celiac sprue), pancreatic insufficiency
- defective 25-hydroxylation
  - liver disease
  - anticonvulsant therapy (phenytoin, carbamazepine, phenobarbital)
- loss of vitamin D binding protein
  - nephrotic syndrome
- defective 1-α-25 hydroxylation
  - hypoparathyroidism
  - renal failure
- pathophysiology: leads to secondary hyperparathyroidism and hypophosphatemia

**Mineralization Defect**
- abnormal matrix
  - osteogenesis imperfecta
  - fibrogenesis imperfecta
  - axial osteomalacia
- enzyme deficiency
  - hypophosphatasia (inadequate ALP bioactivity)
- presence of calcification inhibitors
  - bisphosphonates, aluminum, high dose fluoride, anticonvulsants

*Factors Necessary for Mineralization*
- Quantitatively and qualitatively normal osteoid formation
- Normal concentration of calcium and phosphate in ECF
- Adequate bioactivity of ALP
- Normal pH at site of calcification
- Absence of inhibitors of calcification

</tbody>
</table>

Conditions associated with abnormal matrix formation

- radiologic findings
  - pseudofractures, fissures, narrow radiolucent lines – thought to be healed stress fractures or the result of erosion by arterial pulsation
  - loss of distinctness of vertebral body trabeculae; concavity of the vertebral bodies
  - changes due to secondary hyperparathyroidism: subperiosteal resorption of the phalanges, bone cysts, resorption of the distal ends of long bones
  - others: bowing of tibia, coxa profunda hip deformity
  - bone biopsy: usually not necessary but considered the gold standard for diagnosis

Treatment

- definitive treatment depends on the underlying cause
- vitamin D supplementation
- PO₄³⁻ supplements if low serum PO₄³⁻, Ca²⁺ supplements for isolated calcium deficiency
- bicarbonate if chronic metabolic acidosis

Renal Osteodystrophy

- changes to mineral metabolism and bone structure secondary to chronic kidney disease
- represents a mixture of four types of bone disease:
  - osteomalacia: low bone turnover combined with increased unmineralized bone (osteoid)
  - adynamic bone disease: low bone turnover due to excessive suppression of parathyroid gland
  - osteitis fibrosa cystica: increased bone turnover due to secondary hyperparathyroidism
  - mixed uremic osteodystrophy: both high and low bone turnover, characterized by marrow fibrosis and increased osteoid
- metastatic calcification secondary to hyperphosphatemia may occur

Pathophysiology

- metabolic bone disease secondary to chronic renal failure
- combination of hyperphosphatemia (inhibits 1,25(OH)₂-Vit D synthesis) and loss of renal mass (reduced 1-α-hydroxylase)

Clinical Features

- soft tissue calcifications → necrotic skin lesions if vessels involved
- osteodystrophy → generalized bone pain and fractures
- pruritus
- neuromuscular irritability and tetany may occur
- radiologic features of ostetitis fibrosa cystica, osteomalacia, osteosclerosis, osteoporosis

Investigations

- serum Ca²⁺ corrected for albumin, PO₄³⁻, PTH, ALP, ± imaging (x-ray, BMD), ± bone biopsy

Treatment

- prevention
  - maintenance of normal serum Ca²⁺ and PO₄³⁻ by restricting PO₄³⁻ intake to 1 g OD
  - Ca²⁺ supplements; PO₄³⁻ binding agents (calcium carbonate, aluminum hydroxide)
  - vitamin D with close monitoring to avoid hypercalcemia and metastatic calcification
Paget’s Disease of Bone

Definition
• a metabolic disease characterized by excessive bone destruction and repair

Epidemiology
• a common disease: 5% of the population, 10% of population >80 yr old
• consider Paget's disease of bone in older adults with ↑ ALP but normal GGT

Etiology and Pathophysiology
• postulated to be related to a slow progressing viral infection of osteoclasts, possibly paramyxovirus
• strong familial incidence
• initiated by increased osteoclastic activity leading to increased bone resorption; osteoblastic activity increases in response to produce new bone that is structurally abnormal and fragile

Differential Diagnosis
• primary bone lesions
  ▫ osteogenic sarcoma
  ▫ multiple myeloma
  ▫ fibrous dysplasia
• secondary bone lesions
  ▫ osteitis fibrosa cystica
  ▫ metastases

Clinical Features
• usually asymptomatic (routine x-ray finding or elevated ALP)
• severe bone pain (e.g. pelvis, femur, tibia) is often the presenting complaint
• skeletal deformities: bowed tibias, kyphosis, frequent fractures
• skull involvement: headaches, increased hat size, deafness
• increased warmth over involved bones due to increased vascularity
• high output CHF
• hypercalcemia with immobilization
• osteosarcoma

Investigations
• laboratory
  ▫ ↑↑ serum ALP (unless burnt out), Ca\(^{2+}\) normal or ↑, PO\(_4^{3-}\) normal
  ▫ urinary hydroxyproline ↑ (indicates resorption)
• imaging
  ▫ bone scan to evaluate the extent of disease
  ▫ confirmation on x-ray required to establish the diagnosis
  ▫ skeletal survey: involved bones are denser and expanded with cortical thickening
    ▪ initial lesion may be destructive and radiolucent
    ▪ multiple fissure fractures in long bones

Complications
• local
  ▫ fractures; osteoarthritis
  ▫ cranial nerve compression and palsies (e.g. deafness), spinal cord compression
  ▫ osteosarcoma/sarcomatous change in 1-3%
    ▪ indicated by marked bone pain, new lytic lesions and sudden increased ALP
• systemic
  ▫ hypercalcemia and nephrolithiasis
  ▫ high output CHF due to increased vascularity

Treatment
• symptomatic therapy (pain management)
• weight-bearing exercise
• adequate calcium and vitamin D intake to prevent development of secondary hyperparathyroidism
• treat medically if ALP >3x normal
  ▫ bisphosphonates, e.g. alendronate 40 mg PO OD x 6 mo OR risedronate 30 mg PO OD x 3 mo OR zoledronic acid 5 mg IV per yr
  ▫ calcitonin 50-100 U/d SC
• surgery for fractures, deformity, degenerative changes

Comparison of a Single Infusion of Zoledronic Acid with Risedronate for Paget’s Disease
NEJM 2005;353:898-908
Study: Two identical, randomized, double-blind, actively controlled trials (combined for analysis).
Patients: 357 men and women who were older than 30 yr of age and had radiologically confirmed Paget’s disease. All but 4 patients had alkaline phosphatase levels that were more than twice the upper limit of normal.
Intervention: One 15-min infusion of 5 mg of zoledronic acid compared with 60 d of oral risedronate (30 mg/d) with follow up at 6 mo.
Primary Outcome: Rate of therapeutic response at 6 mo, defined as a normalization of alkaline phosphatase levels or a reduction of at least 75% in the total alkaline phosphatase excess.
Results: At 6 mo, 96% of patients receiving zoledronic acid had a therapeutic response (169 of 176), as compared with 74.3% of patients receiving risedronate (127 of 171, p<0.001). Alkaline phosphatase levels normalized in 88.6% of patients in the zoledronic acid group and 57.9% of patients in the risedronate group (p<0.001). Zoledronic acid was associated with a shorter median time to a first therapeutic response (64 vs. 119 d, p<0.001).
Quality of life increased significantly from baseline at both 3 and 6 mo in the zoledronic acid group and differed significantly from those in the risedronate group at 3 mo. Pain scores improved in both groups. During post-trial follow-up (median, 198 d), 21 of 82 patients in the zoledronate group and 23 of 113 patients in the zoledronic acid group (p=0.001).
Conclusions: A single infusion of zoledronic acid produces more rapid, more complete, and more sustained responses in Paget’s disease than does daily treatment with risedronate.
Male Reproductive Endocrinology

Androgen Regulation

- negative feedback may occur by androgens directly or after conversion to estrogen
- testosterone (from Leydig cells) primarily involved in negative feedback on LH and GnRH, whereas inhibin (from Sertoli cells) suppresses FSH secretion

Tests of Testicular Function

- testicular size (lower limit = 4 cm x 2.5 cm)
- LH, FSH, total, bioavailable, and/or free testosterone
- human chorionic gonadotropin (hCG) stimulation test
  - assesses ability of Leydig cell to respond to gonadotropin
- semen analysis
  - semen volume, sperm concentration, morphology, and motility are the most commonly used parameters
- testicular biopsy
  - indicated with normal FSH and azoospermia/oligospermia

Hypogonadism and Infertility

- see Urology, U34
- deficiency in gametogenesis or testosterone production

Etiology

- causes include primary (testicular failure), secondary (hypothalamic-pituitary failure), and idiopathic
- primary hypogonadism is more common than secondary

Table 38. Classification and Features of Hypogonadism

</table>

Two Distinct Features of Primary Hypogonadism

- The decrease in sperm count is affected to a greater extent than the decrease in serum testosterone level
- Likely to be associated with gynecomastia

Two Features of Secondary Hypogonadism

- Associated with an equivalent decrease in sperm count and serum testosterone
- Less likely to be associated with gynecomastia
**Treatment**
- Testosterone replacement (improve libido, muscle mass, strength, body hair growth, bone mass)
  - IM injection, transdermal testosterone patch/gel, oral
  - Side effects: acne, fluid retention, erythrocytosis, sleep apnea, benign prostatic hypertrophy, uncertain effects on cardiac events/mortality in older men
  - Contraindicated if history of prostate cancer, severe LUTS associated with BPH, uncontrolled or poorly controlled CHF
- GnRH agonist to restore fertility, if hypothalamic dysfunction with intact pituitary
  - Administered SC in pulsatile fashion using an external pump
- hCG ± recombinant follicular stimulating hormone (rFSH) can be used to restore fertility in cases of either hypothalamic or pituitary lesions
- Testicular sperm extraction (TESE) or microscopic sperm extraction (MICROTESE) – only if testicular tissues are not functioning

**Other Causes of Male Infertility**
- Hereditary disorders: Kartagener syndrome, cystic fibrosis
- Anatomy: hypospadias, retrograde ejaculation
- Obstruction: vasal occlusion, vasal aplasia, vasectomy, seminal vesicle disease
- Sexual dysfunction: erectile dysfunction, premature ejaculation, infrequent coitus
- Surgery: TURP, radical prostatectomy, orchiectomy

**DEFECTS IN ANDROGEN ACTION**

**Etiology**
- Complete androgen insensitivity (CAIS)
- Partial androgen insensitivity (PAIS)
- 5-α-reductase deficiency
- Mixed gonadal dysgenesis
- Defects in testosterone synthesis
- Infertile male syndrome
- Undervirilized fertile male syndrome

**Clinical Features**
- Depends on age of onset

**Table 39. Effects of Testosterone Deficiency**

Adapted from: UpToDate, 2010; Cecil’s Essentials of Medicine

**Treatment**
- Appropriate gender assignment in the newborn
- Hormone replacement or supplementation
- Psychological support
- Gonadectomy for cryptorchidism (due to increased risk for testicular cancer)
- Reduction mammoplasty for gynecomastia

**Erectile Dysfunction**

- See Urology, U30
Gynecomastia

Definition
- true gynecomastia refers to benign proliferation of the glandular component of the male breast, resulting in the formation of a concentric, rubbery, firm mass extending from the nipple(s)
- pseudogynecomastia or lipomastia refers to enlargement of soft adipose tissue, especially seen in obese individuals and does not warrant further evaluation

Etiology

Physiologic
- puberty
- elderly (involutional)
- neonatal (maternal hormone)

Pathologic
- endocrinopathies: primary or secondary hypogonadism, hyperthyroidism, extreme hyperprolactinemia, adrenal disease
- tumours: pituitary, adrenal, testicular, breast, ectopic production of hCG
- chronic diseases: cirrhosis, renal, malnutrition (with refeeding)
- drugs: estrogens and estrogen agonists, spironolactone, ketoconazole, cimetidine, digoxin, chemotherapy, marijuana, alcohol
- congenital/genetic: Klinefelter’s syndrome, androgen insensitivity
- other: idiopathic, familial

Pathophysiology
- hormonal imbalance due to increased estrogen activity (increased production, or increased availability of estrogen precursors for peripheral conversion to estrogen) or decreased androgen activity (decreased androgen production, binding of androgen to sex hormone binding globulin (SHBG), or androgen receptor blockage)

History
- recent change in breast characteristics
- trauma to testicles
- mumps
- alcohol and/or drug use
- FHx
- sexual dysfunction

Physical Exam
- signs of feminization
- breast
  - rule out red flags suggesting breast cancer: unilateral, eccentric, hard, or fixed mass, skin dimpling or retraction, and nipple discharge or crusting
  - gynecomastia occurs concentrically around nipple, is not fixed to underlying tissue, and no discrete mass is palpable
- genito-urinary exam
- stigmata of liver or thyroid disease

Investigations
- laboratory: serum TSH, PRL, LH, FSH, testosterone, estradiol, LFTs, creatinine, hCG (if hCG is elevated need to locate the primary tumour)
- CXR and CT of chest/abdomen/pelvis (to locate neoplasm)
- testicular U/S to rule out testicular mass
- MRI of hypothalamic-pituitary region if pituitary adenoma suspected

Treatment
- initial observation for most men with gynecomastia
- medical
  - correct the underlying disorder, discontinue responsible drug
  - androgens for hypogonadism
  - anti-estrogens: tamoxifen, clomiphene
- surgical
  - usually required for macromastia; gynecomastia present for >1 yr (fibrosis is unresponsive to medication); or failed medical treatment and for cosmetic purposes

Paraneoplastic Syndrome

- clinical syndromes involving non-metastatic systemic effects that accompany malignant disease
- triggered by antibodies against neoplasm cross-reacting with normal tissue or by production of a physiologically active substance by the neoplasm
- commonly present with cancers of lung, breast, ovaries, or lymphatic system

## Landmark Endocrinology Trials

<table>
<thead>
<tr>
<th>Trial</th>
<th>Reference</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DIABETES</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>ACCORD</td>
<td>NEJM 2008; 358:2560-72</td>
<td>Compared with standard therapy the use of intensive therapy to target normal HbA1c levels (&lt;6%) for 3.5 yr increased mortality and did not significantly reduce major cardiovascular events.</td>
</tr>
<tr>
<td>ADVANCE</td>
<td>NEJM 2008; 358:2545-59</td>
<td>Intensive glucose control that lowered the HbA1c value to 6.5% reduced the incidence of nephropathy but did not significantly reduce major macrovascular events, death from cardiovascular events, or death from any cause; hypoglycemia was more common in the intensive control group.</td>
</tr>
<tr>
<td>BARI-2D</td>
<td>NEJM 2009; 360:2503-15</td>
<td>In patients with both type 2 DM and CAD no significant difference was found in the rates of death and major cardiovascular events in patients undergoing prompt revascularization and those undergoing medical therapy or between strategies of insulin sensitization and insulin.</td>
</tr>
<tr>
<td>DCCT</td>
<td>NEJM 1993; 329:977-86</td>
<td>Intensive blood glucose control delayed the onset and reduced the progression of microvascular complications (retinopathy, nephropathy, and neuropathy) in type 1 DM.</td>
</tr>
<tr>
<td>EDIC</td>
<td>NEJM 2005; 353:2844-53</td>
<td>Compared with conventional therapy intensive DM therapy early on without macrovascular disease (goal HbA1c &lt;6.05%) has long-term beneficial effects on the risk of cardiovascular disease in patients with type 1 DM.</td>
</tr>
<tr>
<td>Look.AHEAD</td>
<td>NEJM 2013; 369:145-54</td>
<td>Moderate weight loss (&lt;7% BW) and increased exercise are not associated with reduction in CVD and its complications among overweight or obese patients with type 2 DM.</td>
</tr>
<tr>
<td>NAVIGATOR</td>
<td>NEJM 2010; 362:1463-90</td>
<td>In patients with impaired glucose tolerance, nateglinide did not reduce progression to DM or risk of cardiovascular events while valsartan only reduced progression to DM.</td>
</tr>
<tr>
<td>PREDIMED</td>
<td>NEJM 2013; 368:1279-90</td>
<td>A Mediterranean diet with extra-virgin olive oil or nuts reduces rates of MI, CVA, or CV death in those at high risk for CV disease (outcome was driven by reduction in rates of CVA).</td>
</tr>
<tr>
<td>Steno-2</td>
<td>NEJM 2008; 358:580-91</td>
<td>In at-risk patients with type 2 DM intensive intervention with multiple drug combinations and behaviour modification had sustained significant beneficial effects with respect to vascular complications and mortality; multifactorial intervention is critical in the management of type 2 DM.</td>
</tr>
<tr>
<td>UKPDS Extension</td>
<td>NEJM 2008; 359:1577-89</td>
<td>Continued risk reduction in microvascular risk and emergent risk reductions for MI and death from any cause 10 yr post UKPDS trial follow up in type 2 DM.</td>
</tr>
<tr>
<td>VADT</td>
<td>NEJM 2009; 360:1-11</td>
<td>In patients with longstanding poorly controlled type 2 DM intensive glucose control had no significant effect on the rates of major cardiovascular events, death, or microvascular complications; adverse events, predominantly hypoglycemia, were more common in the intensive control group.</td>
</tr>
<tr>
<td><strong>LIPIDS</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>4S</td>
<td>Lancet 1994; 344:1383-89</td>

Four Principles of Family Medicine

College of Family Physicians of Canada Guidelines
1. The family physician is a skilled clinician
   • in diagnosing and managing diseases common to the population served
   • recognizes importance of early diagnosis of serious life-threatening illnesses
2. Family medicine is a community-based discipline
   • provides information and access to community services
   • responds/adapts to changing needs and circumstances of the community
3. The family physician is a resource to a defined practice population
   • serves as a health resource
   • advocates for public policy to promote health
4. The patient-physician relationship is central to the role of the family physician
   • committed to the person, not just the disease
   • promotes continuity of patient care

Periodic Health Examination

• Canadian Task Force on Preventive Health Care established in 1976, first published in 1979
• mandate: to develop and disseminate clinical practice guidelines for primary and preventive care
• recommendations are based on systematic analysis of scientific evidence
  • most notable recommendation is the abolition of the annual physical exam; replaced by the PHE

Purpose of the Periodic Health Examination

• primary prevention: identify risk factors for common diseases; counsel patients to promote healthy behaviour
• secondary prevention: presymptomatic detection of disease to allow early treatment and to prevent disease progression
• update clinical data
• enhance patient-physician relationship

Classification of Recommendations (GRADE, 2011)

Strength of Recommendation
• strong: high level of confidence that desirable effects outweigh undesirable effects (strong recommendation for an intervention) or that the undesirable effects outweigh desirable effects (strong recommendation against an intervention)
  • implies that most individuals will be best served by the recommended course of action
• weak: desirable effects probably outweigh the undesirable effects (weak recommendation for an intervention) or undesirable effects probably outweigh the desirable effects (weak recommendation against an intervention); uncertainty exists
  • implies that most people would want the recommended course of action but that many would not
  • different choices will be appropriate for different individuals, patients require support in reaching a management decision consistent with his/her values and preferences

Quality of Evidence
• high: high level of confidence that true effect lies close to the estimate of the effect
• moderate: true effect likely to be close to the estimate of the effect, but there is a possibility that it is substantially different
• low or very low: true effect may be substantially different from the estimate of the effect

| PHYSICAL           |                             |
| • Blood pressure measurement at primary care visits, using techniques described in CHIEP guidelines (strong recommendation; moderate quality evidence) |                             |
| • BMI measurement in obese adults (B) |                             |

| TESTS               |                             |
| • See recommendations below for age and gender specific screening for diabetes, dyslipidemia, hypertension and cancer screening (colon, prostate, cervical and breast) | Routine hemoglobin for high risk infants (B), Blood lead screening of high risk infants (B) |
| • Folic acid supplementation to women of child-bearing age (A) | STB High Risk Groups: Mantoux skin testing (A) |
| • Pharmacologic treatment of HTN with dBP > 90 mmHg (adults age 21-64, elderly specific subgroup) (A) | STI High Risk Groups: Voluntary HIV antibody screening (A) Chlamydia screening in women (B) Syphilis screen (A) |
| • Varicella vaccine for children age 1-12 and susceptible adolescents/adults (A) | Syphilis Risk Group: VDLR test (A) |
| • Rubella vaccine for all non-pregnant women of child-bearing age unless there is proof of immunity via immunization records or serology (B) |                             |
| • Tetanus vaccine: routine booster q10yr if had 1st series (A) |                             |
| • Pertussis vaccine: adults < 65 should receive one booster given as Tdap– Adacel® or Boostrix® (A) |                             |
| • Herpes zoster vaccine for adults ≥60 |                             |

| THERAPY             |                             |
| • Folic acid supplementation to women of child-bearing age (A) | Pediatrics: Routine immunizations (A), Hepatitis B, HPV and Meningococcal immunizations are offered in schools in most Canadian provinces |
| • Pharmacologic treatment of HTN with dBP > 90 mmHg (adults age 21-64, elderly specific subgroup) (A) | Influenza High Risk Groups: Outreach strategies for vaccination (A), annual immunization (B), now recommended for all |
| • Varicella vaccine for children age 1-12 and susceptible adolescents/adults (A) |                             |
| • Rubella vaccine for all non-pregnant women of child-bearing age unless there is proof of immunity via immunization records or serology (B) |                             |
| • Tetanus vaccine: routine booster q10yr if had 1st series (A) |                             |
| • Pertussis vaccine: adults < 65 should receive one booster given as Tdap– Adacel® or Boostrix® (A) |                             |
| • Herpes zoster vaccine for adults ≥60 |                             |

Breast Cancer Screening Guidelines

2011 Recommendations on Screening for Breast Cancer in Average-Risk Women (The Canadian Task Force on Preventive Health Care)

- average-risk women: women age 40-74 with no personal history of breast cancer, history of breast cancer in 1st degree relatives, known mutations of the BRCA1/BRCA2 genes or previous exposures of the chest wall to radiation

Mammography
- age 40-49: routine screening with mammography not recommended (weak recommendation - moderate quality evidence)
- age 50-74: routine screening q2-3yr (age 50-69: weak recommendation; moderate quality evidence, age 70-74: weak recommendation; low quality evidence)
- age 75+: screen if benefits outweigh harm, must take overall health into account

Magnetic Resonance Imaging
- no routine screening with MRI scans (weak recommendation - low quality evidence)
Clinical Breast Examination
• no routine CBE alone or in conjunction with mammography to screen for breast cancer (weak recommendation - low quality evidence)

Breast Self-Examination
• recommend not advising women to routinely practice breast self-examination
• for more information on benign breast lesions and breast cancer, see General Surgery, GS56

Colorectal Cancer Screening Guidelines
• recommendations for average risk individuals (asymptomatic, no family history of UC, polyps, or CRC)
• average risk testing should begin at age 50, but assessment for risk factors should begin earlier to identify high-risk individuals
   • Canadian Association of Gastroenterology (2010)
     • FOBT q1-2yr. Note: high sensitivity FOBT or FIT (fecal immunochemical testing) are recommended
     • flexible sigmoidoscopy q10yr
     • colonoscopy q10yr
   • no screening after age 75 is recommended for average risk patients, but it may be assessed on an individual basis for ages 76-85
• for more information on colorectal neoplasms, see General Surgery, GS34

Figure 1. Approach to higher risk screening
AAPP = attenuated adenomatous polyposis; FAP = familial adenomatous polyposis; HNPCC = hereditary nonpolyposis colorectal cancer; 1st degree relatives: parents, siblings, children; 2nd degree relatives: grandparents, aunts, uncles; 3rd degree relatives: great grandparents or cousins. Figure printed with permission from Can J Gastroenterol 2004;18:93-99. Also see: Colorectal Screening for Cancer Prevention in Asymptomatic Patients, March 2013. Available from http://www.bcguidelines.ca/pdf/colorectal_screening.pdf

Cervical Cancer Screening
• either conventional Papanicolaou (Pap) smear or liquid based cytology testing
• endocervical and exocervical cell sampling (aim is to sample the transitional zone)
• best identifies squamous cell abnormalities, less reliable for glandular abnormalities
  • false positives 5-10%, false negatives 10-40% (for single test)
  • false negative rate 50% for existing cervical cancer
• cervical cancer screening guidelines differ by provincial jurisdiction (see The Society of Obstetricians and Gynaecologists of Canada guidelines)

  Canadian Task Force for Preventative Care Guidelines
• screen all women age ≥25 ≤69 yr (age 25-29: weak recommendation; moderate quality evidence, age 30-69: strong recommendation; high quality evidence)
• women age ≥70: if 3 normal tests in a row and no abnormal tests in last 10 yr, can discontinue screening (weak recommendation; low quality evidence)
• Ontario guidelines
  - screen all women age ≥21 who are or have ever been sexually active (includes intercourse or digital/oral activity with partner of either gender)
  - if cytology is normal, can screen every 3 yr
  - women age ≥70: if 3 successive negative Pap tests in last 10 yr, can discontinue screening
  - women who are not sexually active by age 21 should delay cervical cancer screening until sexually active
• pregnant women and women who have sex with women should follow the routine cervical screening regimen
• women who have had a hysterectomy
  - total: discontinue screening if hysterectomy was for benign disease and no history of cervical dysplasia or HPV infection, continue to swab vaginal vault if history of uterine malignancy/dysplasia
  - subtotal: continue screening according to guidelines
• exceptions to guidelines
  - immunocompromised (transplant, steroids, diethylstilbestrol exposure, HIV)
  - previously unscreened patients
• for more information on cervical cancer (see Gynecology, GY44)

![Cervical Cancer Screening Diagram]

Figure 2. Decision making chart for cervical cancer screening (not applicable for adolescents)
AGUS = atypical glandular cells of unknown significance; ASCUS = abnormal squamous cells of unknown significance; ASC-H = abnormal squamous cells cannot rule out HSIL; LSIL = low grade squamous intraepithelial lesion; TZ = transitional zone
Adapted from: Ontario Cervical Screening Cytology Guidelines. May 2012

Prostate Cancer Screening

• Canadian Task Force for Preventative Care Guidelines
  - screening for prostate cancer with the prostate specific antigen test is not recommended for any age group (age <55: strong recommendation; low quality evidence, age 55-69: weak recommendation; moderate quality evidence, age >70: strong recommendation; low quality evidence)

Prostate Cancer Mortality at 11 Years of Follow-Up
NEJM 2012;366:981-990
Study: Updated “ERSPC” study – multicentre randomized trial of screening for prostate cancer using PSA.
Patients: 162,388 men, ages 55-69 from 8 different European countries.
Intervention: PSA-based screening.
Main Outcome: Mortality from prostate cancer.
Results: After median follow up of 11 yr, the RRR of death from prostate cancer was 21%. The ARR was 1.07 deaths/1,000 men. NNT = 1,055 – therefore to prevent one death from prostate cancer at 11 yr follow up, 1,055 men would need to be screened.
Health Promotion and Counselling

- health promotion is the most effective preventive strategy
- 40-70% of productive life lost annually is preventable
- there are several effective ways to promote healthy behavioural change, such as discussions appropriate to a patient's present stage of change
- for more information about motivational interviewing, see www.motivationalinterviewing.org

Motivational Strategies for Behavioural Change

Table 2. Motivational Strategies for Behavioural Change

<table>
<thead>

Handy Serving Size Comparisons
- 3 oz meat, fish, poultry → palm of hand
- 1 cup dairy (milk/yogurt) → size of fist
- Bread/grains → one slice, palm of hand
- ½ cup rice/pasta → one hand cupped
- 1 cup of fruit/vegetables → two cupped hands
- 1 oz cheese → full length of thumb
- 1 tsp oil/butter → tip of thumb
- Nuts/chips/snacks → palm covered

Energy Content of Food
- Carbohydrates 4 kcal/g
- Protein 4 kcal/g
- Fat 9 kcal/g
- Ethanol 7 kcal/g

Calculating Total Daily Energy Expenditure (TDEE)
- Roughly 35 kcal/kg/d
- Varies by age, weight, sex, and activity level
- Average 2000-2100 kcal/d for women, 2700-2900 kcal/d for men

Canadian Cancer Society (CCS) Recommendations for Vitamin D Use
- Based on CCS research on Vitamin D and the prevention of colorectal, breast and prostate cancer
- In consultation with their healthcare provider, the Society is recommending that:
  - Adults living in Canada should consider taking Vitamin D supplementation of 1,000 international units (IU) a day during the fall and winter
  - Adults at higher risk of having lower Vitamin D levels should consider taking Vitamin D supplementation of 1,000 IU/d all year round. This includes people: who are older, with dark skin, who do not go outside often, and who wear clothing that covers most of their skin
  - Babies who are exclusively breast-fed: 400 IU/d
Cardiovascular Disease Prevention

Table 4. Dietary Guidelines for Reducing Risk of Cardiovascular Disease

<table>
<thead>
<tr>
<th>Recommendations</th>
<th>Effects</th>

<tr>
<td>≤2 drink/d for women, max 10/wk</td>
<td></td>
</tr>
<tr>
<td>Dietary Approaches</td>
<td></td>
</tr>
<tr>
<td>DASH diet (Dietary Approaches to Stop Hypertension), recommended by the American Heart Association (AHA)</td>
<td>Lower BP, lower LDL</td>
</tr>
<tr>
<td>Diet: high in vegetables/fruits, low-fat dairy, whole grains, poultry, fish, and nuts</td>
<td></td>
</tr>
<tr>
<td>Low in sweets, sugar-sweetened beverages, red meats</td>
<td></td>
</tr>
<tr>
<td>Macronutrients: low in saturated total fat and cholesterol, high in potassium, magnesium, calcium, protein, and fibre</td>
<td></td>
</tr>
</tbody>
</table>

MUFAs = monounsaturated fatty acids; PUFAs = polyunsaturated fatty acids

References

Obesity

- see Canadian Task force on Preventive Health Care recommendations (CMAJ February 2015) at: canadiantaskforce.ca/ctfphc-guidelines/2015-obesity-adults/
- body mass index (BMI) = weight (kg)/height (m)^2 = weight (lbs)/height (in)^2 x 703; BMI is a poor predictor of obesity
- waist circumference (WC) = flexible tape placed on horizontal plane at iliac crest, normal depends on ethnic background
- increased WC for BMI 25-35 increases the risk of cardiovascular disease and type 2 diabetes

Table 5. Classification of Weight by BMI, Waist Circumference, and Associated Disease Risks in Adults

Epidemiology

- 16% (4 million) of people ≥18 yr old are obese, 32% (8 million) are overweight in Canada, according to StatsCan (2007)
- obesity rate in people of Aboriginal origin is 1.6 times higher than the national average
- proportion of children aged 6-11 who are overweight has more than doubled in the last 25 yr; percentage of overweight adolescents has tripled
- overweight and obesity rates in children are directly proportional to screen time (see Exercise, FM10)
- 10-15% of population consume <30% fat daily
- obese persons generally consume more energy-dense food which tends to be highly processed, micronutrient poor, and high in fats, sugars, or starch

Osteoporosis Canada

Recommendations for Calcium and Vitamin D Daily Requirements
- Vitamin D: 800-1,000 IU for individuals age <50 yr; 800-2,000 IU for individuals ≥50 yr
- Calcium: 1,000 mg daily from all sources for individuals 19-50 yr and pregnant/fatigating women; 1,200 mg daily for individuals ≥50 yr

Effectiveness of behavioral and pharmacologic treatment for overweight and obesity in adults. CMAJ Open 2014;2:E36-17
- Study: Review of 88 RCTs comparing the interventions: diet, exercise, diet and exercise, lifestyle, oralist or metformin to control groups: no intervention, usual care, placebo or minimal interventions (e.g. newsletter or single information session on healthy living).
- Population overweight and obese adults >18 yr.
- Outcome measures: weight 12 mo post intervention and secondary health outcomes: total cholesterol, LDL, fasting blood glucose, incidence of DM-2, systolic and diabetic BP.
- Results:
  1. Intervention participants had a greater mean weight loss, greater reduction in waist circumference and greater reduction in BMI.
  2. For cholesterol and fasting glucose- the reduction was greater for participants in pharmacologic plus behavioral intervention as opposed to those using behavioral interventions alone.
  3. A diagnosis of new onset type 2 DM was less likely to occur in intervention participants compared with the control group.
- Conclusion: Behavioral and pharmaceutical interventions for overweight and obesity in adults leads to clinically significant results.

Losing Weight

- Aim for caloric intake 500-1000 kcal/d less than total daily energy expenditure (TDEE)
- 3500 kcal energy expended/ lb of fat burned
- Results in 1-2 lb (0.5-1 kg) weight loss per wk
- Achieved by combination of increased activity and/or decreased caloric intake

Low BMI Associations

- Osteoporosis
- Eating disorders
- Under-nutrition
- Pregnancy complications

Adverse Medical Consequences of Obesity

- Type 2 DM
- CAD
- Stroke
- HTN
- Gallbladder disease
- Non-alcoholic steatohepatitis
- Complications of pregnancy
- Dyslipidemia
- Osteoarthritis
- Sleep apnea
- Certain cancers
- CHF
- Low back pain
- Increased total mortality
Screening Recommendations
- the CANRISK or FINRISC scores can be used to assess the risk for type 2 diabetes in overweight and obese patients
- BMI risk assessment should be done every 3-5 yr in people at high risk of developing diabetes within 10 yr

Management

Behavioural/Lifestyle
- weight loss of >5% is clinically significant for reducing many cardiovascular risk factors (e.g. elevated blood pressure, glucose and lipids)
- efficacious behavioural interventions were greater than 12 months duration, included diet and/or exercise and/or lifestyle components, and included group and individual sessions
- no intervention for weight gain prevention in individuals BMI 18.5–24.9
- structured behavioural and lifestyle interventions should be offered or arranged for overweight individuals BMI >25
- strong recommendation for those with increased risk of Type 2 DM
- BMI >35 + risk factors or BMI >40 are candidates for bariatric surgery failing behavioural modification

Pharmacologic
- the task force recommends against pharmacologic intervention to manage overweight and obesity, although some patients may prefer medications and be good candidates for pharmacologic treatment
- high benefit of behavioural modification alone, NNH 10 (mostly GI side effects) for pharmacotherapy

### Figure 4. 2006 Canadian clinical practice guidelines on the management and prevention of obesity in adults and children (summary) Adapted from: CMAJ 2007;176:S1-S13

<table>

<tr>
<th>Overweight or obese adult</th>
<th>IMPORANT MESSAGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Measure BMI</td>
<td>A modest weight loss of 5-10% of body weight is beneficial</td>
</tr>
<tr>
<td>Measure waist circumference if BMI is &gt;25 and ≤35 kg/m²</td>
<td>Weight maintenance and prevention of weight regain should be considered as long-term goals</td>
</tr>
</tbody>
</table>

#### Management

**Lifestyle modification program**
- **Nutrition:** Reduce energy intake by 500-1000 kcal/d
- **Physical activity:** Initially 30 min of moderate-intensity 3-5 times/wk; eventually >60 min per wk for 6 mo

**Lifestyle modification program**
- **Assess readiness to change behaviours and barriers to weight loss**
- **Entreat health team to advise lifestyle modification program**

- **Nutrition therapy**
  - **Reduce energy intake by 500-1000 kcal/d**
- **Physical activity**
  - **Initially 30 min of moderate-intensity 3-5 times/wk; eventually >60 min per wk for 6 mo**

### Pharmacotherapy
- **Orlistat:** gastrointestinal lipase inhibitor, reduces fat absorption by 30% by inhibition of pancreatic lipase
- **Orlistat** is associated with several adverse effects and not approved for clinical use longer than 2 yr
- **Orlistat should be avoided in people with inflammatory or chronic bowel disease**

### Hyperlipidaemia Signs
- Atheroma: plaques in blood vessel walls
- Xanthelasmata: a sharply demarcated yellowish deposit of cholesterol underneath the skin, usually on or around the eyelid
- Tendinous xanthoma: lipid deposit in tendon (especially Achilles)
- Eruptive xanthoma: hypertiglyceridaemia induced reddish yellow, pruritic, and painful papular or nodular rash
- Lipemia retinalis: thin atheroma seen in the retinal blood vessels
- Coronel arcus (arcus senilis): lipid deposit in cornea

---

**The Latest Evidence on Fad Diets...**

Comparison of the Atkins, Ornish, Weight Watchers, and Zone Diets for Weight Loss and Heart Disease Risk Reduction

**Purpose:** To assess the effectiveness and adherence rates of four popular diets for weight loss and reduction of cardiac risk factors.

**Study Characteristics:** Single centre RCT at academic medical centre in Boston, MA; 160 participants were randomized to either Atkins (carbohydrate restriction), Zone (macronutrient balanced and low glycemic load), Weight Watchers (low calorie/portion size), or Ornish (fat restriction) diet groups for a period of 18 mo.

**Participants:** Adults age 22-72 with known HTN, dyslipidaemia, or fasting hyperglycaemia.

**Results:** Assuming that participants who discontinued the study remained at baseline, the mean weight loss at 1 yr (and self selected dietary adherence rates per self report) were 2.1 kg for Atkins (53% of participants completed, p = 0.009), 3.2 kg for the Zone (65% of participants completed, p = 0.002), 3.0 kg for Weight Watchers (65% completed, p = 0.001), 3.3 kg for Ornish (50% completed, p = 0.007). Each diet significantly reduced the LDL:HD ratio by ~10% (p<0.05), with no significant effects on blood pressure or glucose. Amount of weight loss was associated with adherence level (r = 0.60, p<0.001) but not with diet type (r = 0.07, p=0.40). Weight loss for each diet was significantly associated with reduction in levels of total/HDL cholesterol (r=0.36), C-reactive protein (r=-0.37), and insulin (r=0.39), with no significant difference between diets.

**Conclusion:** Each popular diet was associated with modest weight loss and reduction of several cardiac risk factors. Adherence level, and not diet type, was the most important predictor of weight loss and cardiac risk factor reduction.

---

**IMPORTANT MESSAGE**

- Assess readiness to change behaviours and barriers to weight loss
- Devise goals and lifestyle modification program for weight loss and reduction of risk factors
- Weight loss goal: 5-10% of body weight, or 0.5-1 kg (1-2 lb) per wk for 6 mo
- Health team to advise lifestyle modification program
- Nutrition: Reduce energy intake by 500-1000 kcal/d
- Physical activity: Initially 30 min of moderate intensity 3-5 times/wk; eventually >60 min per wk for 6 mo

**Satisfactory progress or goal achieved?**

- Yes
  - Regular monitoring
    - Assist with weight maintenance
    - Reinforce healthy eating and physical activity advice

- No
  - Weight maintenance and prevention of weight regain
    - Nutrition therapy
    - Physical activity
    - Cognitive behavioural therapy
    - Address other risk factors: periodic monitoring of weight, BMI and waist circumference q1-2yr

  - Pharmacotherapy
    - BMI ≥27 kg/m² + risk factors or BMI ≥30 kg/m²
    - Adjunct to lifestyle modifications: consider if patient has not lost 0.5-1 kg (1-2 lb) per wk by 3-6 mo after lifestyle changes

  - Bariatric surgery
    - BMI ≥35 kg/m² + risk factors or BMI ≥40 kg/m²
    - Consider if other weight loss attempts have failed. Requires lifelong medical monitoring

---

**Figure 4.** 2006 Canadian clinical practice guidelines on the management and prevention of obesity in adults and children (summary) Adapted from: CMAJ 2007;176:S1-S13
Dyslipidemia

- see Endocrinology, E2
- defined as abnormal elevation of plasma cholesterol or triglyceride levels

Assessment
- measure fasting serum TC, LDL-C, HDL-C, and TG
- screen with full fasting lipid profile q1-3yr in males >40 yr and females >50 yr or who are menopausal, or at any age for adults with additional dyslipidemia risk factors (see sidebar)
- screen for secondary causes: hypothyroidism, chronic kidney disease, DM, nephrotic syndrome, liver disease
- risk category
  - estimate using the model for 10 yr CAD risk developed from the Framingham data (Framingham Risk Score – FRS)
  - FRS calculated based on the following factors: gender, age, HDL-C, total cholesterol, sBP, smoking, DM
  - family history of CVD <55 male relative or <65 in female relative doubles FRS
  - to be completed for men age 40-75, and women age 50-75 q3-5yr
  - cardiovascular age calculated as patient’s age ± the difference between his or her estimated remaining life expectancy

- used to increase adherence to therapy and reaffirm positive effect of following therapy
- treatment decisions focus on LDL-C level and/or FRS risk; the alternate primary targets are apolipoprotein B (apo B) and non-HDL-C (not used widely yet)
  - if moderate risk and LDL-C <3.5, treatment decision thresholds shifted to apo B >1.2g/L or non-HDL-C >4.3 mmol/L
  - other targets include: TC:HDL-C ratio, apo B:apo AI ratio, hs-CRP (used more for risk stratification of CAD), non-HDL-C, and serum TG levels

### Table 6. Target Lipid Values for Primary Prevention of CAD (2012 Canadian Cholesterol Guidelines)

<table>
<thead>
<tr>
<th>Risk Category</th>
<th>Initiate Treatment if</th>
<th>Primary Targets</th>
<th>Alternate</th>
</tr>
</thead>
<tbody>
<tr>
<td>High (FRS ≥20%)</td>
<td>Consider treatment in all patients</td>
<td>LDL-C ≤2 mmol/L or ≥50% decrease in LDL-C</td>
<td>apo B &lt;0.80 g/L or non-HDL-C ≤2.6 mmol/L</td>
</tr>
<tr>
<td>Also: AAA, history of DM (&gt;40 yrs, DM for 15 yr and age &gt;30, microvascular complications), CAD, PVD, atherosclerosis, CKD, or Male with HTN plus one of: smoking, EKG abnormality, LVH, Fam hx of premature death, age &gt;55 yr, TC/ HDL-C &gt;6, microalbuminuria</td>
<td>LDL-C ≥3.5 mmol/L</td>
<td>≤2 mmol/L or ≥50% decrease in LDL-C</td>
<td>apo B &lt;0.80 g/L or non-HDL-C ≤2.6 mmol/L</td>
</tr>
<tr>
<td>Moderate (FRS 10-19%)</td>
<td>For LDL-C &lt;3.5 consider if: apo B ≥1.2 g/L or non-HDL-C ≥4.3 mmol/L</td>
<td>LDL-C ≥5.0 mmol/L</td>
<td>Familial hypercholesterolemia</td>
</tr>
</tbody>
</table>

Management
- intensity and type of treatment is guided by “risk category” assigned (see Table 6)

1. health behaviours (can decrease LDL-C by up to 10%)
   - smoking cessation: probably the most important for preventing CAD
   - dietary modification: reduce saturated fat, red meat, refined sugar, alcohol; consume nuts, fruits/vegetables, poultry, fish
   - physical activity: at least 150 min of moderate to vigorous intensity aerobic exercise per wk
   - employ consistent lifestyle modifications for at least 3 mo before considering drug therapy; high risk patients should start treatment immediately with concurrent health behaviour interventions

2. pharmacologic therapy (can decrease LDL-C by up to 40%)
   - for a comparison of dyslipidemia medications, see Endocrinology, E53
   - 1st line monotherapy: statins (HMG-CoA reductase inhibitors)
     - risks: myopathy and hepatotoxicity
     - if severe side effects: ezetimibe (cholesterol absorption inhibitor) can be used for 19% reduction in LDL-C
   - post-ACS, cholesterol absorption inhibitors (e.g. ezetimibe) in addition to simvastatin reduced mortality, attained lipid targets <1.8, and improved outcomes in high risk individuals
   - lower evidence for other agents: bile acid sequestrants, nicotinic acid, fibrates, psyllium

Non-fasting Lipids vs. Fasting Lipids
- Non-fasting (TC and non-HDL cholesterol) can be used for Framingham Risk Assessment and hold same prognostic value as fasting lipids
- In fasted vs. non-fasted samples, Non-HDL and TC varies by 2%, LDL-C by 10% and TG by 20%
- Recently, non-fasting LDL-C has the same prognostic value as fasting LDL-C

Safety of Statins: An Update
- Therapeutic Advances in Drug Safety 2012;3:133-144
- Trials have shown that statin therapy slightly increases the incidence of diabetes; however, the absolute risk is small. Relative to the reduction in coronary events, the clinical significance is not great enough to recommend against their use.
monitoring
- ALT, CK, Cr at baseline then 6 wk later for signs of transaminitis or myositis; tolerate rise in CK up to 10 times upper limit of normal vs. 2-3 times if symptomatic, or serum creatinine rise of ≤ 25%;
- no routine repeated measures of ALT and creatine kinase necessary in asymptomatic patients using statin therapy
- if adequate response is achieved, evaluate fasting lipids q6-12mo

Isolated Hypertriglyceridemia
- does not increase your cardiovascular risk
- normal HDL-C and TC, elevated TG
- mild ≥2.2 mmol/L (≥ 200 mg/dL); marked ≥5.6 mmol/L (≥500 mg/dL)
- principal therapy is lifestyle modification
  - weight loss, exercise, avoidance of smoking and alcohol, effective blood glucose control in diabetics, increased omega-3 fatty acid intake
  - severe hypertriglyceridemia (typically >10 mmol/L) is associated with an increased risk of acute pancreatitis
- drug therapy (used to prevent pancreatitis, NOT cardiovascular disease!)
  - nicotinic acid
  - fibrates

Exercise

Epidemiology
- 25% of the population exercises regularly, 50% occasionally, 25% are sedentary

Management
- assess current level of fitness, motivation, and access to exercise
- encourage warm up and cool down periods to allow transition between rest and activity and to avoid injuries
- exercise with caution for patients with CAD, DM (risk of hypoglycemia), exercise-induced asthma
- patients with known CAD should have cardiac assessment prior to commencing exercise
- benefits of exercise
  - reduces risk of premature death, heart disease, stroke, HTN, certain types of cancer, type 2 DM, osteoporosis, and overweight/obesity
  - leads to improved fitness, strength, and mental health (morale and self-esteem)

Table 7. Canadian Physical Activity and Sedentary Behaviour Guidelines (2012 CSEP Guidelines)

<table>
<thead>

</table>

---

**Smoking Cessation**

**Epidemiology**
- smoking is the single most preventable cause of premature illness and death
- 70% of smokers see a physician each year
- 2012 Canadian data from the Canadian Tobacco Use Monitoring Survey (CTUMS) on population age ≥15
  - 16% are current smokers (lowest since 1965)
  - highest prevalence in age group 20-24 (20%)
  - 11% of youth age 15-19 smoke (decreased from 25% in 2000): more males smoke than females; number of cigarettes consumed per day also decreasing

**Management**
- general approach
  - identify tobacco users; elicit smoking habits, previous quit attempts and results
  - CAN-ADAPPT 2012 guidelines
    - tobacco use status should be updated for all patients regularly (Grade 1A)
    - health care providers should clearly advise patients to quit (Grade 1C)
    - health care providers should also monitor the patients’ mental health status/other addictions while quitting smoking. Medication dosage should be monitored and adjusted as necessary (Grade 1A)
- every smoker should be offered treatment
  - combining counselling and smoking cessation medication is more effective than either alone (Grade 1A)
  - make patient aware of withdrawal symptoms
    - low mood, insomnia, irritability, anxiety, difficulty concentrating, restlessness, decreased heart rate, increased appetite
    - ≥4 counselling sessions >10 min each with 6-12 mo follow-up yields better results
  - ≥14 abstinent with counselling vs. 10% without counselling
  - approach depends on patient’s stage of change (see *Motivational Strategies for Behavioural Change*, FM6)
- willing to quit
  - provision of social support, community resources (self-help, group, helpline, web-based strategies)
  - pregnant patients: counselling is recommended as 1st line treatment (Grade 1A). Nicotine replacement therapy (NRT) should be made available to pregnant women who are unable to quit using non-pharmacologic methods; intermittent NRT use (lozenges, gum) is preferred over continuous dosing of the patch (Grade 1C). Use bupropion (no evidence of fetal or reproductive harm) only if benefits > risks; consult Motherisk. Varenicline has not been studied in pregnancy and should not be used in pregnant women
- pharmacologic therapy
  1. Nicotine Replacement Therapy (NRT)
    - 19.7% abstinent at 12 mo with NRT vs. 11.5% for placebo
    - no difference in achieving abstinence for different forms of NRT
    - reduces cravings and withdrawal symptoms without other harmful substances that are contained in cigarettes
    - use with caution: immediately post-MI, serious/worsening angina, serious arrhythmia
    - advise NO smoking while using NRT
  2. Antidepressants (note: mode of action appears to be independent of antidepressant effect)
    - Bupropion SR (Zyban®)
      - 21% abstinent at 12 mo vs. 8% for placebo
      - no advantage for NRT vs. bupropion (similarly effective)
    - Varenicline
      - 11% of youth age 15-19 smoke (decreased from 25% in 2000): more males smoke than females; number of cigarettes consumed per day also decreasing
      - highest prevalence in age group 20-24 (20%)
      - 16% are current smokers (lowest since 1965)
      - 11% of youth age 15-19 smoke (decreased from 25% in 2000): more males smoke than females; number of cigarettes consumed per day also decreasing
  - in ≥15 years of age
    - accumulate 150 min of moderate to vigorous intensity aerobic physical activity per wk, in bouts of 10 m or more. It is beneficial to add muscle and bone strengthening activities using major muscle groups, at least 2 d per wk.
  - low body mass index (BMI) (≥15 years of age) adults should be encouraged to increase their physical activity and bone strengthening activities using major muscle groups, at least 2 d per wk.
  - Those with poor mobility should perform physical activities to enhance balance and prevent falls

---

**The 5 A’s for Patients Willing to Quit**
- Ask, if the patient smokes
- Advise patients to quit
- Assess willingness to quit
- Assist in quit attempt
- Arrange follow-up

**The 2-3 Pattern of Smoking Cessation**
- Onset of withdrawal is 2-3 h after last cigarette
- Peak withdrawal is at 2-3 d
- Expect improvement of withdrawal symptoms at 2-3 wk
- resolution of withdrawal at 2-3 mo
- Highest relapse rate at 2-3 mo

**Assist Patient in Developing Quit Plan**
- STAR
  - Set quit date
  - Tell family and friends (for support)
  - Anticipate challenges (e.g. withdrawal)
  - Remove tobacco-related products (e.g. ashtrays/lighters)

**Antidepressants for Smoking Cessation**
- This systematic review of 90 randomized trials compared antidepressant medication to placebo or alternative pharmacotherapy for smoking cessation and where follow-up was longer than 6 mo.
- Conclusions: The antidepressants bupropion and nortriptyline can aid smoking cessation and have a similar efficacy to NRT. Bupropion is less effective than varenicline. Neither SSRIs (e.g. fluoxetine) nor MAOIs aid smoking cessation.
3. Varenicline (Champix®)
- partial nicotinic receptor agonist (to reduce cravings) and partial competitive nicotinic receptor antagonist (to reduce the response to smoked nicotine)
- more effective than bupropion (23% abstinent from 9–52 wk with varenicline vs. 16% for bupropion vs. 9% with placebo)
- significant side effects may lower patient compliance.

<tr>
<td></td>
<td></td>
<td>± additional 12 wk as maintenance</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

* Bupropion and Varenicline may be used in combination with nicotine replacement therapy

- unwilling to quit
  - motivational intervention (5 Rs)
  1. Relevance to patient
    - relevant to patient’s disease status or risk, family or social situation (e.g. having children in the home), health concerns, age, gender
  2. Risks of smoking
    - short-term: SOB, asthma exacerbation, impotence, infertility, pregnancy complications, heartburn, URTI
    - long-term: MI, stroke, COPD, lung CA, other cancers
    - environmental: higher risk in spouse/children for lung CA, SIDS, asthma, respiratory infections
  3. Rewards: benefits
    - improved health, save money, food tastes better, good example to children
  4. Roadblocks: obstacles
    - fear of withdrawal, weight gain, failure, lack of support
  5. Repetition
    - reassure unsuccessful patients that most people try many times before successfully quitting (average number of attempts before success is 7)
- recent quitter
  - highest relapse rate within 3 mo of quitting
  - minimal practice: congratulate on success, encourage ongoing abstinence, review benefits and problems
  - prescriptive interventions: address problem of weight gain, negative mood, withdrawal, lack of support

**Conclusions:** Cytisine increases the chances of successful long-term smoking cessation between two- and threefold compared with pharmacologically unassisted quit attempts. Lower dose regimens also conferred benefits for cessation, while reducing the incidence of adverse events. More participants quit successfully with varenicline than with bupropion.
Alcohol

• see Psychiatry, PS24

Definition
• diagnostic categories occur along a continuum

Epidemiology
• 10-15% of patients in family practice are problem drinkers
• 20-50% of hospital admissions, 10% of premature deaths, 30% of suicides, and 50% of fatal traffic accidents in Canada are alcohol-related
• more likely to miss diagnosis in women or elderly, patients with high socioeconomic status

Assessment
• screen for alcohol dependence with CAGE questionnaire
  ▪ if CAGE positive, explore with further questions for alcohol abuse/dependence
  ▪ assess drinking profile
    ▪ setting, time, place, occasion, with whom
    ▪ impact on: family, work, social
    ▪ quantity-frequency history
      ▪ how many drinks per day?
      ▪ how many days per week?
      ▪ maximum number of drinks on any one day in the past month?
  ▪ if identified positive for alcohol problem
    ▪ screen for other drug use
    ▪ identify medical/psychiatric complications
    ▪ ask about drinking and driving
    ▪ ask about past recovery attempts and current readiness for change

Investigations
• GGT and MCV for baseline and follow-up monitoring
• AST, ALT (usually AST:ALT approaches 2:1 in an alcoholic)
• CBC (anemia, thrombocytopenia), INR (decreased clotting factor production by liver)

Management
• intervention should be consistent with patient’s motivation for change
• individualized counselling and regular follow-up is crucial
• 10% of patients in alcohol withdrawal will have seizures or delirium tremens
• Alcoholics Anonymous/12-steps program
• outpatient/day programs for those with chronic, resistant problems
• family treatment (Al-Anon, Alateen, screen for spouse/child abuse)
• in-patient program if
  ▪ dangerous or highly unstable home environment
  ▪ severe medical/psychiatric problem
  ▪ addiction to drug that may require in-patient detoxification
  ▪ refractory to other treatment programs
• pharmacologic
  ▪ diazepam for withdrawal
  ▪ disulfiram (Antabuse®): impairs metabolism of alcohol by blocking conversion of acetaldehyde to acetic acid, leading to flushing, headache, N/V, hypotension if alcohol is ingested (available in U.S., but no longer available in Canada)
  ▪ naltrexone: competitive opioid antagonist that reduces cravings and pleasurable effects of drinking
  ▪ may trigger withdrawal in opioid-dependent patients
  ▪ acamprosate: glutamate receptor modulator that also reduces craving
• see Psychiatry, PS25

Prognosis
• relapse is common and should not be viewed as failure
• monitor regularly for signs of relapse
• 25-30% of abusers exhibit spontaneous improvement over 1 yr
• 60-70% of individuals with jobs and families have an improved quality of life 1 yr post-treatment

Standard Drink Equivalents
One standard drink = 14 g of pure alcohol
• Beer (5% alcohol) = 12 oz
• Wine (12-17% alcohol) = 5 oz
• Fortified wine = 3 oz
• Hard liquor (40%) = 1.5 oz

CAGE Questionnaire
C Have you ever felt the need to CUT down on your drinking?
A Have you ever felt ANNOYED at criticism of your drinking?
G Have you ever felt GUILTY about your drinking?
E Have you ever had a drink first thing in the morning to steady your nerves or get rid of a hangover? (EYE OPENER)
≥2 for men or ≥1 for women suggests possibility of problem drinking (sensitivity 85%, specificity 89%)

Some Adverse Medical Consequences of Problem Drinking
• GI: gastritis, dyspepsia, pancreatitis, liver disease, bleeds, diarrhea, oral/esophageal cancer
• Cardiac: HTN, alcoholic cardiomyopathy
• Neurologic: Wernicke-Korsakoff syndrome, peripheral neuropathy
• Hematologic: anemia, coagulopathies
• Other: trauma, insomnia, family violence, anxiety/depression, social/family dysfunction, sexual dysfunction, fetal damage

Abstinence
Low Risk Drinking
• <2 drinks/d
• <10 drinks/wk for women
• <15 drinks/wk for men
At Risk Drinking
• Consumption above low-risk level but no alcohol-related physical or social problems
Alcohol Use Disorder
• Physical or social problems
• Continued use despite consequences
• Inability to fulfill life roles
• Legal problems
• No evidence of dependence
• Alcohol Use Disorder

Figure 5. Continuum of alcohol use
Common Presenting Problems

Abdominal Pain

- see Gastroenterology, G4 and General Surgery, GS4

Epidemiology
- 20% of individuals have experienced abdominal pain within the last 6-12 mo
- 90% resolve in 2-3 wk
- only 10% are referred to specialists, of those <10% admitted to hospital

Etiology
- most common diagnosis in family medicine at 28% is “nonspecific abdominal pain,” which has no identifiable cause and is usually self-limited
- GI disorders (e.g. PUD, pancreatitis, IBD, appendicitis, gastroenteritis, IBS, diverticular disease, biliary tract disease)
- urinary tract disorders (e.g. UTI, renal calculi)
- gynecological disorders (e.g. PID, ectopic pregnancy, endometriosis)
- cardiovascular disorders (e.g. CAD, AAA, ischemic bowel)
- other: DKA, porphyria, hypercalcemia, medications (e.g. NSAIDs), alcohol, toxic ingestion, foreign body, psychogenic

Pathophysiology
- type of pain
  - somatic pain: sharp, localized pain
  - visceral pain: dull, generalized pain
- location of pain
  - epigastric (foregut): distal esophagus, stomach, proximal duodenum, biliary tree, pancreas, liver
  - RUQ: biliary, hepatic, colonic, pulmonary, renal
  - LUQ: cardiac, gastric, pancreatic, renal, vascular
  - periumbilical (midgut): distal duodenum to proximal 2/3 of transverse colon,
  - hypogastric (hindgut): distal 1/3 of transverse colon to rectosigmoid region,
  - RLQ: colonic, appendix, gynecologic, renal
  - LLQ: colonic, gynecologic, renal
  - any location: aneurysm, dissection, ischemia, zoster, muscle strain, hernia, bowel obstruction, ischemia, peritonitis, porphyria, DKA

Investigations
- guided by findings on history and physical
- possible blood work: CBC, electrolytes, BUN, Cr, amylase, lipase, AST, ALT, ALP, bilirubin, glucose, INR/PTT, tox screen, β-hCG
- imaging
  - CXR (for free air under the diaphragm) in setting of perforation in surgical abdomen
  - abdominal x-ray, KUB (consider: gas pattern, free air, kidney stones, constipation)
  - ultrasound (renal stones, gallbladder disease, gynecological problems, liver disease, pancreatitis, diverticular disease, appendicitis)
  - CT scan (AAA, appendicitis), non-contrast helical CT-Scan (first choice for renal stones)
- other tests
  - urinalysis
  - endoscopy (for peptic ulcers, gastritis, tumours, etc.)
  - H. pylori testing (urea breath test, serology, biopsy)

Allergic Rhinitis

- see Otolaryngology, OT24

Definition
- inflammation of the nasal mucosa that is triggered by an allergic reaction

Classification
- seasonal
  - symptoms during a specific time of the year
  - common allergens: trees, grass and weed pollens, airborne moulds
- perennial
  - symptoms throughout the year with variation in severity
  - common allergens: dust mites, animal dander, moulds
- persistent allergic rhinitis may lead to chronic rhinosinusitis

Differential Diagnosis
- Acute viral infection
- Vasomotor rhinitis
- Deviated septum
- Nasal polyps
- Acute/chronic sinusitis
- Drug-induced rhinitis
Etiology
• increased IgE levels to certain allergens → excessive degranulation of mast cells → release of inflammatory mediators (e.g. histamine) and cytokines → local inflammatory reaction

Epidemiology
• affects approximately 40% of children and 20-30% of adults
• prevalence has increased in developed countries, particularly in the past two decades
• associated with asthma, eczema, sinusitis, and otitis media

Assessment
• identify allergens
• take an environmental/occupational history
• ask about related conditions (e.g. atopic dermatitis, asthma, sinusitis, and family history)

Management
• conservative
  ▪ minimize exposure to allergens
  ▪ most important aspect of management, often sufficient (may take months)
  ▪ maintain hygiene, saline nasal rinses
• pharmacologic agents
  ▪ oral antihistamines – first line therapy for mild symptoms
    ▪ e.g. cetirizine (Reactine®), fexofenadine (Allegra®), loratadine (Claritin®)
  ▪ intranasal corticosteroids for moderate/severe or persistent symptoms (>1 mo of consistent use to see results)
  ▪ intranasal decongestants (use must be limited to <5 d to avoid rhinitis medicamentosa)
• allergy skin testing
  ▪ for patients with chronic rhinitis
  ▪ symptoms not controlled by allergen avoidance, pharmacological therapy
  ▪ may identify allergens to include in immunotherapy treatment
• immunotherapy (allergy shots)
  ▪ reserved for severe cases unresponsive to pharmacologic agents
  ▪ consists of periodic (usually weekly) subcutaneous injections of custom prepared solutions of one or more antigens to which the patient is allergic

Amenorrhea
• see Gynecology, G10

Anxiety
• see Psychiatry, PS14

Epidemiology
• 25-30% of patients in primary care settings have psychiatric disorders
• many are undiagnosed or untreated; hence the need for good screening
• high rate of coexistence of anxiety disorders and depression

Screening
• screening tools such as the GAD-7 tool
• screening questions
  ▪ Do you tend to be an anxious or nervous person?
  ▪ Have you felt unusually worried about things recently?
  ▪ Has this worrying affected your life? How?

Assessment
• associated symptoms
• risk factors
  ▪ family history of anxiety or depression, past history of anxiety, stressful life event, social isolation, female, comorbid psychiatric diagnosis (e.g. depression)
• assess substance abuse, comorbid depression, stressful life events, trauma, suicidal ideation/self-harm
• to differentiate anxiety disorders, consider symptoms (panic attacks, specific situations/stressors, excessive worry about common concerns, repetitive thoughts and/or behaviours to neutralize the anxiety) and their duration
• Generalized Anxiety Disorder 7-item (GAD – 7) scale to assess level of anxiety

Rhinitis Medicamentosa
Rebound nasal congestion. Occurs with prolonged use (>5-7 d) of vasoconstrictive intranasal medications. Patient may become dependent, requiring more frequent dosing to achieve the same decongestant effect

Symptoms of GAD
AND I C REST
Anxious, nervous, or worried
No control over the worry
Duration >6 mo
Irritability
Concentration impairment
Restlessness
Energy decreased
Sleep impairment
Tension in muscles
Can Fam Physician 2005;51:1340-1342

Differential Diagnosis of Anxiety Disorders
• Panic disorder
• GAD
• Social Anxiety Disorder (previously Social Phobia)
• Agoraphobia
• Specific phobia
• Selective Mutism
• Separation Anxiety Disorder
• Other: GMC, AMC, mood disorder, psychotic disorder, OCD, PTSD
Asthma/COPD

Definition
- asthma
  - chronic but reversible airway inflammation characterized by periodic attacks of wheezing, SOB, chest tightness, and coughing
  - airways hyper-responsive to triggers/antigens leading to acute obstructive symptoms by bronchoconstriction, mucous plugs and increased inflammation
  - cannot be diagnosed at first presentation; called reactive airway disease until recurrent presentations
  - pulmonary function tests (PFTs) can be done from age 6 or when child able to follow instructions to do PFTs
  - peak flow meters are useful in the office and at home for monitoring
- chronic obstructive pulmonary disease (COPD)
  - a group of chronic, progressive, obstructive lung diseases characterized by limited airflow with variable degrees of air sac enlargement and lung tissue destruction
  - emphysema and chronic bronchitis are the most common forms of COPD

Management
- patient education: emphasize prevalence, good recovery rate of anxiety conditions
- lifestyle advice: decrease caffeine and alcohol intake, exercise, relaxation techniques, mindfulness strategies
- self-help materials, community resources (e.g. support groups)
- CBT: cognitive interventions, exposure therapy, etc.
- treat any underlying medical and/or comorbid conditions
- provide support to family and caregivers
- for pharmacotherapy, see Psychiatry, PS47

Rule Out
- Cardiac (post MI, arrhythmia)
- Endocrine (hyperthyroidism, diabetes, pheochromocytoma)
- Respiratory (asthma, COPD)
- Somatoform disorders
- Psychotic disorders
- Mood disorders (depression, bipolar)
- Personality disorder (ODPD)
- Drugs (amphetamines, thyroid preparations, caffeine, OTC for colds/decongestants, alcohol/benzodiazepine withdrawal)

Figure 6. Differentiating anxiety disorders

Figure 7. Expiratory flow volume curves (obstructive, normal, and restrictive disease)
Adapted from: Weinberger SE. Principles of pulmonary medicine, 5th ed. With permission from Elsevier. ©2008

Signs of Poorly Controlled Asthma
- β2 agonist use >4x/wk
- Asthma-related absence from work/school
- Exercise induced asthma
- Night-time symptoms >1x/wk
**Benign Prostatic Hyperplasia**

- see Urology, U7

**Definition**
- hyperplasia of the stroma and epithelium in the periurethral transition zone

**History and Physical**
- include current/past health, surgeries, trauma, current and OTC meds
- specific urinary symptoms
- physical exam must include DRE for size, symmetry, nodularity, and texture of prostate (prostate is symmetrically enlarged, smooth, and rubbery in BPH)

**Investigations**
- urinalysis to exclude UTI and for microscopic hematuria (common sign)
- serum PSA: protein produced by prostatic tissue
  - values
    - <4.0 ng/mL: normal, but must take into account patient’s age and velocity of PSA increase
    - 4-10 ng/mL: consider measuring free/total PSA
    - >10 ng/mL: high likelihood of prostate pathology
- PSA testing is inappropriate in men with a life expectancy less than 10 yr or patients with prostatitis, UTI

**Table 10. Differentiating COPD from Asthma**

---

**More About Inhalers**

- Aerosols (puffers=MDI, MDI + spacer)
- MDIs should be used with spacers to:
  - Reduce side effects
  - Improve amount inhaled
  - Increase efficiency of use
- Dry Poweder Inhalers (discus, turbohaler, and diskhaler) require deep and fast breathing (may not be ideal for children)
- Nebulizers can be used to convert liquid medications into a fine mist: recommended for use if contraindications to MDIs

---

**Differential Diagnosis of Wheezing**

- Allergies, anaphylaxis
- Asthma, reactive airway disease
- GERD
- Infections (bronchitis, pneumonia)
- Obstructive Sleep Apnea
- COPD
- Less common: congestive heart disease, foreign body, malignancy, cystic fibrosis, vocal cord dysfunction

---

**Self-Management Asthma and COPD**

**Education and Written Action Plan**

- Education is a key component in management of asthma and COPD
- Guided self-management combining education, regular medical review, self-assessment, and written action plan have been shown to reduce hospitalizations, ER visits, and missed days at work or school
- Sample action plans available online: [http://www.respiratoryguidelines.ca](http://www.respiratoryguidelines.ca)
increased PSA in a younger man is more often due to cancer than other causes
abnormal DRE or PSA should trigger further assessment
discuss test with men at increased risk of prostate cancer (FHx, African ancestry) or who are concerned about development of prostate cancer
decision to test PSA in an asymptomatic man should involve discussion about the risks and possible benefits
other tests
• Cr, BUN
• post-void residual volume by ultrasound
• urodynamic studies, renal ultrasound
• patient voiding diary
tests NOT recommended as part of routine initial evaluation include:
• cystoscopy
• cytology
• prostate ultrasound or biopsy
• IVP
• urodynamic studies

Management
• referral to urologist if moderate/severe symptoms
• conservative: for patients with mild symptoms or moderate/severe symptoms considered by the patient to be non-bothersome
  • fluid restriction (avoid alcohol and caffeine)
  • avoidance/monitoring of certain medications (e.g. antihistamines, diuretics, antidepressants, decongestants)
  • pelvic floor/Kegel exercises
  • bladder retraining (scheduled voiding)
• pharmacological: for moderate/severe symptoms
  • α-receptor antagonists (e.g. terazosin [Hytrin®], doxazosin [Cardura®], tamsulosin [Flomax®], alfuzosin [Xatral®])
    • relaxation of smooth muscle around the prostate and bladder neck
  • 5α-reductase inhibitor (e.g. finasteride [Proscar®])
    • only for patients with demonstrated prostatic enlargement due to BPH
    • inhibits enzyme responsible for conversion of testosterone into dihydrotestosterone (DHT) thus reducing growth of prostate
  • phytotherapy (e.g. saw palmetto berry extract, Pygeum africanum)
    • more studies required before this can be recommended as standard therapy
    • considered safe
• surgical
  • TURP (transurethral resection of the prostate), TUIP (transurethral incision of the prostate, for prostates <30 g)
  • absolute indications: failed medical therapy, intractable urinary retention, benign prostatic obstruction leading to renal insufficiency
  • complications: impotence, incontinence, ejaculatory difficulties (retrograde ejaculation), decreased libido

Bronchitis (Acute)

Definition
• acute infection of the tracheobronchial tree causing inflammation leading to bronchial edema and mucus formation

Epidemiology
• 5th most common diagnosis in family medicine, most common is URTI

Etiology
• 80% viral: rhinovirus, coronavirus, adenovirus, influenza, parainfluenza, respiratory syncytial virus (RSV)
• 20% bacterial: M. pneumoniae, C. pneumoniae, S. pneumoniae

Differential Diagnosis
• Prostate cancer
• Urethral obstruction
• Bladder neck obstruction
• Neurogenic bladder
• Overactive bladder
• Cystitis
• Prostatitis

Differential Diagnosis of Bronchitis
• URTI
• Asthma
• Acute exacerbation of chronic bronchitis
• Sinusitis
• Pneumonia
• Bronchiolitis
• Pertussis
• Environmental/occupational exposures
• Post-nasal drip
• Others: GERD, CHF, cancer, aspiration syndromes, CF, foreign body
Investigations
- acute bronchitis is typically a clinical diagnosis
- sputum culture/Gram stain is not very informative
- CXR if suspect pneumonia (cough $>3$ wk, abnormal vital signs, localized chest findings) or CHF
- PFT with methacholine challenge if suspect asthma

Management
- primary prevention: frequent hand washing, smoking cessation, avoid irritant exposure
- symptomatic relief: rest, fluids ($3-4$ L/d when febrile), humidity, analgesics and antitussives as required
- bronchodilators may offer improvement of symptoms (e.g. salbutamol)
- current literature does not support routine antibiotic treatment for the management of acute bronchitis because it is most likely to be caused by a viral infection
  - antibiotics may be useful if elderly, comorbidities, suspected pneumonia, or if the patient is toxic (refer to Antimicrobial Quick Reference, FM54)
  - antibiotics in children show no benefit

Chest Pain
- see Cardiology and Cardiac Surgery, C4 and Emergency Medicine, ER21

Differential Diagnosis

*Emergency

Investigations
- ECG, CXR, and others if indicated (cardiac enzymes, d-dimers, liver function tests [LFTs], etc.)
- refer to ED if suspect serious etiology (e.g. aortic dissection, MI)

Management of Common Causes of Chest Pain
- angina/ischemic heart disease
  - nitroglycerin (NTG): wait 5 min between sprays and if no effect after 3 sprays, send to ED
  - myocardial infarction
    - ASA (160-325 mg, chewed stat), clopidogrel (Plavix*), LMWH (enoxaparin), morphine, oxygen, NTG
    - $\pm$ reperfusion therapy with fibrinolytics (e.g. tPA, RPA, TNK, or SK) if within 12h (ideally $<30$ min) or percutaneous intervention (cath lab) if $<90$ min
    - start $\beta$-blocker (e.g. metoprolol starting dose 25 mg PO q6h or bid, titrating to HR goal of 55–60 bpm)
- endocarditis: antibiotic choice is based on whether patient has a native or prosthetic heart valve as well as culture and sensitivity results
- GERD: antacids, $H_2$ blockers, PPIs, patient education
- costochondritis: NSAIDs

Treatment of Stable Ischemic Heart Disease
- see Cardiology and Cardiac Surgery, C28
Common Cold (Acute Rhinitis)

- **Definition**
  - viral URTI with inflammation

- **Epidemiology**
  - most common diagnosis in family medicine, peaks in winter months
  - incidence: adults = 2-4/yr, children = 6-10/yr
  - organisms
    - mainly rhinoviruses (30-35% of all colds)
    - others: coronavirus, adenovirus, RSV, influenza, parainfluenza, coxsackie virus
  - incubation: 1-5 d
  - transmission: person-person contact via secretions on skin/objects and by aerosol droplets

- **Risk Factors**
  - psychological stress, excessive fatigue, allergic nasopharyngeal disorders, smoking, sick contacts

- **Clinical Features**
  - symptoms
    - local: nasal congestion, clear to mucopurulent secretions, sneezing, sore throat, conjunctivitis, cough
    - general: malaise, headache, myalgias, mild fever
  - signs
    - boggy and erythematous nasal/oropharyngeal mucosa, enlarged lymph nodes
  - normal chest exam
  - complications
    - secondary bacterial infection: otitis media, sinusitis, bronchitis, pneumonia
    - asthma/COPD exacerbation

- **Differential Diagnosis**
  - allergic rhinitis, pharyngitis, influenza, laryngitis, croup, sinusitis, bacterial infections

- **Management**
  - patient education
    - symptoms peak at 1-3 d and usually subside within 1 wk
    - cough may persist for days to weeks after other symptoms disappear
    - no antibiotics indicated because of viral etiology
    - secondary bacterial infection can present within 3-10 d after onset of cold symptoms
  - prevention
    - frequent hand washing, avoidance of hand to mucous membrane contact, use of surface disinfectant
    - yearly influenza vaccination
  - symptomatic relief
    - rest, hydration, gargling warm salt water, steam, nasal irrigation (spray/pot)
    - analgesics and antipyretics: acetaminophen, ASA (not in children because risk of Reye's syndrome)
    - cough suppression: dextromethorphan or codeine if necessary (children under 6 yr of age should not use any cough/cold medications)
    - decongestants, antihistamines
    - zinc lozenge use may help to reduced the duration of cold symptoms
  - patients with reactive airway disease will require increased use of bronchodilators and inhaled steroids

Concussion/Mild Traumatic Brain Injury

- **Definition**
  - see Neurosurgery, NS30, and Emergency Medicine, ER9
  - a useful tool for the assessment of individuals and athletes with concussion is the Sport Concussion Assessment Tool, 3rd edition (SCAT3), Br J Sports Med 2013 47: 259

Contraception

- **Definition**
  - see Gynecology, GY16

**EMERGENCY CONTRACEPTION**

- hormonal EC (Yuzpe® or Plan B®, usually 2 doses taken 12 h apart) or post-coital IUD insertion
- hormonal EC is effective if taken within 72 h of unprotected intercourse (reduces chance of pregnancy by 75-85%), most effective if taken within 24 h, does not affect an established pregnancy
• post-coital IUDs inserted within 5 d of unprotected intercourse are significantly more effective than hormonal EC (reduces chance of pregnancy by ~99%)
• pregnancy test should be performed if no menstrual bleeding within 21 d of either treatment
• advance provision of hormonal EC increases the use of EC without decreasing the use of regular contraception
• pharmacists across Canada can dispense Plan B* OTC

Dementia (Major Neurocognitive Disorder)

• see Psychiatry, PS21

Epidemiology
• 10% in patients over the age of 65, 25% in patients over the age of 85, 50% in patients over the age of 90
• prevalence increases with age, Down syndrome, and head trauma
• differential diagnosis: Alzheimer's dementia, vascular dementia, Lewy-Body dementia, frontotemporal dementia

Investigations
• history, physical exam, MMSE, MOCA (best screening test), dementia quick screen (see sidebar)
• investigations are completed to exclude reversible causes of dementia and should be selected based on the clinical circumstances
• CBC, liver enzymes, TSH, renal function tests, serum electrolytes, serum calcium, serum glucose, vitamin B12, folate, VDRL, HIV, head CT

Management
• treat and prevent reversible causes
• provide orientation cues (e.g. calendars, clocks) and optimize vision and hearing
• family education, counselling, and support (respite programs, group homes)
• pharmacologic therapy: NMDA receptor antagonists and cholinesterase inhibitors slow rate of cognitive decline; low-dose neuroleptics and antidepressants can be used to treat behavioral and emotional symptoms
• 20% of patients develop clinical depression, most commonly seen in vascular dementia

Depression

• see Psychiatry, PS10

Etiology
• often presents as non-specific complaints (e.g. sleep disturbance, chronic fatigue, pain)
• depression is a clinical diagnosis and tests are done in order to rule out other causes of symptoms
• 2/3 of depressed persons may not receive appropriate treatment for their depression
• identification and early treatment improve outcomes

Screening Questions
• new Canadian Task Force on Preventive Health Care guidelines (2013) recommends against routine screening
• although routine screening is not recommended, useful questions for at-risk populations are:
  • “Are you depressed?” (high specificity and sensitivity)
  • “Have you lost interest or pleasure in the things you usually like to do?” (anhedonia)
  • “Do you have problems sleeping?”
• for geriatric population, use the Geriatric Depression Scale (GDS) short form for screening
Assessment
- risk factors: see Psychiatry, PS11
- personal or family history of depression
- medications and potential substance abuse problems
- high risk suicidality/homicidality
  - fill out Form 1 (in Ontario): application by physician to hospitalize a patient against his/her will for psychiatric assessment (up to 72 h)
  - functional impairment (e.g. work, relationships)
- at least 5 out of 9 criteria including at least one of anhedonia or depressed mood ≥ 2 wk for actual diagnosis to be met (see sidebar)
- validated depression rating scales: Beck’s depression inventory, Zung’s self-rating depression scale, Children’s depression inventory, Geriatric Depression Scale, Personal Health Questionnaire Depression Scale (PHQ-9)
- routine medical workup (physical exam, CBC, TSH, ferritin, folate, B₁₂, electrolytes, urinalysis, glucose, etc.)

Treatment
- goal: full remission of symptoms and return to baseline psychosocial function
- phases of treatment
  - acute phase (8-12 wk): relieve symptoms and improve quality of life
  - maintenance phase (6-12 mo after symptom resolution): prevent relapse/recurrence, must stress importance of continuing medication treatment for full duration to patients
- treatment can consist of pharmacotherapy alone or psychotherapy alone
- combination of antidepressant drug therapy and psychotherapy results in synergistic effects
- treatment of youth (age 10-21)
  - for mild depression, a period of active support and monitoring before initiating treatment is recommended
  - fluoxetine is first line among SSRIs (most evidence)
  - monitor closely for adverse effects such as suicidal ideation and behavior
  - psychotherapy
  - CBT or interpersonal therapy (IPT) alone can be used for mild depression
  - psychotherapy plus medication is recommended for moderate to severe depression
  - treatment should continue for at least 6 months
  - ongoing management should include assessment in key domains (school, home, social setting)
  - reassessment and referral recommended if no improvement after 6-8 wk of treatment
- for adolescents with moderate/severe depression and coexisting psychosomatic and/or substance abuse, consider referral

Table 13. Common Medications

<table>
<thead>
<tr>
<th>Class</th>
<th>Examples</th>
<th>Action</th>
<th>Side Effects</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>SSRI</td>
<td>paroxetine (Paxil)</td>
<td>Block serotonin reuptake</td>
<td>Sexual dysfunction (impotence, decreased libido, delayed ejaculation, anorgasmia), headache, GI upset, weight loss, tremors, insomnia, fatigue, increase GI interval (baseline ECG is suggested)</td>
<td>First line therapy for youth is fluoxetine; paroxetine is not recommended for youth (controversial)</td>
</tr>
<tr>
<td>SNRI</td>
<td>venlafaxine (Effexor)</td>
<td>Block serotonin and NE reuptake</td>
<td>Insomnia, tremors, tachycardia, sweating</td>
<td></td>
</tr>
<tr>
<td>SDRI</td>
<td>bupropion (Wellbutrin)</td>
<td>Block dopamine and NE reuptake</td>
<td>Headache, insomnia, nightmares, seizures, less sexual dysfunction than SSRIs</td>
<td>Often chosen for lack of sexual side effects, can be used for augmentation of anti-depressant effects with other classes of medication</td>
</tr>
<tr>
<td>TCA</td>
<td>amitriptyline (Elavil)</td>
<td>Block serotonin and NE reuptake</td>
<td>Sexual dysfunction, weight gain, tremors, tachycardia, sweating</td>
<td>Narrow therapeutic window, lethal in overdose</td>
</tr>
</tbody>
</table>

Prognosis
- up to 40% resolve spontaneously within 6-12 mo
- risks of recurrence: 50% after 1 episode; 70% after 2 episodes; 90% after 3 episodes

Diabetes Mellitus
- see Endocrinology, E7

Definition
- a group of metabolic diseases characterized by persistent hyperglycemia.

Classification
- type 1: primarily a result of pancreatic β-cell destruction
- type 2: characterized by insulin resistance
- GDM: glucose intolerance with onset or first recognition during pregnancy

Criteria for Depression (≥5/9 with at least one of anhedonia or depressed mood for ≥ 2 wk)

M-SIGECAPS
M Depressed Mood
S Increased/decreased Sleep
I Decreased Interest
G Guilt
E Decreased Energy
C Decreased Concentration
A Increased/decreased Appetite and weight
P Psychomotor agitation/retardation
S Suicidal ideation

Combined Pharmacotherapy and Psychological Treatment for Depression: A Systematic Review Arch Gen Psychiatry 2004;61:714-719

Study: Systematic review of randomized clinical trials.
Patients: 16 trials comprising 1,842 patients.
Intervention: Antidepressant treatment alone vs. combination of psychological intervention and antidepressant therapy.
Main Outcomes: Efficacy of and adherence to therapy.
Results: Overall, combined therapy was significantly more effective than antidepressant therapy alone (OR 1.88; 95% CI 1.38-2.52), however there was no difference in the rate of dropouts and non-responders in either treatment arm. In studies lasting > 12 wk, combined therapy showed a reduction in dropouts compared to non-responders (OR 0.59; 95% CI 0.39-0.88).
Epidemiology
• major health concern, affecting up to 10% of Canadians
• incidence of type 2 DM is rising dramatically as a result of an aging population, rising rates of obesity, and sedentary lifestyles
• leading cause of new-onset blindness and renal dysfunction
• Canadian adults with DM are twice as likely to die prematurely, compared to persons without DM

Risk Factors
• type 1 DM
  ▪ personal or family history of autoimmune disease
• type 2 DM
  ▪ first degree relative with DM
  ▪ age ≥40 yr
  ▪ obesity (especially abdominal), HTN, hyperlipidemia, CAD, vascular disease
  ▪ prior GDM, macrosomic baby (>4 kg)
  ▪ PCOS
  ▪ history of IGT or IFG
  ▪ presence of complications associated with DM
  ▪ presence of associated diseases: PCOS, acanthosis nigricans, psychiatric disorders, HIV
  ▪ medications: glucocorticoids, atypical antipsychotics, HAART
• both
  ▪ member of a high risk population (e.g. Aboriginal, Hispanic, Asian, or African descent)

Diagnosis
• persistent hyperglycemia is the hallmark of all forms of DM

Table 14. Diagnosis of Prediabetes and Diabetes

<table>
<thead>
<tr>
<th>Condition</th>
<th>Diagnostic Criteria</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM</td>
<td>One of the following on 2 occasions:</td>
</tr>
<tr>
<td></td>
<td>• Random BG ≥11.1 mmol/L (200 mg/dL) with symptoms of DM (fatigue, polyuria, polydipsia, unexplained weight loss) OR</td>
</tr>
<tr>
<td></td>
<td>• Fasting BG ≥7.0 mmol/L (126 mg/dL) OR</td>
</tr>
<tr>
<td></td>
<td>• BG 2 h post 75 g OGGT ≥11.1 mmol/L (200 mg/dL) OR</td>
</tr>
<tr>
<td></td>
<td><strong>If asymptomatic (and meet any of the above criteria) a repeat test must be done to confirm the diagnosis. If symptomatic (fatigue, polyuria, polydipsia, unexplained weight loss), the diagnosis is made with one test.</strong></td>
</tr>
<tr>
<td>Impaired Fasting Glucose (IFG)</td>
<td>Fasting BG = 6.1-6.9 mmol/L (110-124 mg/dL)</td>
</tr>
<tr>
<td>Impaired Glucose Tolerance (IGT)</td>
<td>BG 2 h post 75 g OGGT = 7.8-11.0 mmol/L (141-198 mg/dL)</td>
</tr>
<tr>
<td>Prediabetes</td>
<td>HbA1c = 6.0-6.4%</td>
</tr>
</tbody>
</table>

Screening
• type 2 DM
  ▪ FBG in everyone ≥40 q3yr, or at high risk using the CANRISK calculator
  ▪ more frequent and/or earlier testing if presence of ≥1 risk factor (see above)
• GDM (see Obstetrics, OB27)
  ▪ all pregnant women between 24-28 wk gestation

Goals of Therapy

Table 15. Goals of Therapy in Diabetes

| General                     | Avoid complications (e.g. ketoacidosis, hyperglycemia, infection)                      |
|                            | Prevent long-term complications (microvascular and macrovascular)                      |
|                            | Minimize negative sequelae associated with therapies (e.g. hypoglycemia, weight gain) |
| Fasting or Preprandial BG  | Ideal: 4-7 mmol/L (72-126 mg/dL)                                                     |
|                            | Suboptimal: 7.1-10 mmol/L (128-180 mg/dL); action may be required                     |
|                            | Inadequate: >10.0 mmol/L (180 mg/dL); action required                                  |
|                            | Frail Elderly: target is 5-12 mmol/L                                                 |
| HbA1c                      | ≤7% or ≤6.5% in some type 2 DM patients at risk for nephropathy                        |
|                            | Suboptimal: 7-8.4%                                                                    |
|                            | Inadequate: >8.4%                                                                    |
|                            | Frail elderly, advanced co-morbidities, recurrent severe hypoglycemia or hypoglycemia unawareness: target is 7.1-8.5%   |
| 2 h Postprandial BG        | 5-10 mmol/L (90-180 mg/dL) if HbA1c target met                                       |
|                            | 5-8 mmol/L (90-144 mg/dL) if HbA1c target not met                                    |
|                            | Frail elderly: use clinical judgment                                                  |
| Blood Pressure             | <130/80 in adults (DM and HTN guidelines)                                             |
| Lipids                     | LDL <2.0 mmol/L (36 mg/dL)                                                           |

Nonpharmacologic Management

- **diet**
  - all diabetics should see a registered dietician for nutrition counselling
  - can reduce HbA1c by 1-2%
  - moderate weight loss (5%) improves glycemic control and CVD risk factors
  - decrease combined saturated fats and trans-fatty acids to <10% of calories
  - avoid simple sugars, choose low glycemic-index foods, ensure regularity in timing and spacing of meals
  - physical activity and exercise
    - at least 150 min of aerobic exercise per wk, plus 2 sessions per wk of resistance exercise is recommended
    - encourage 30-45 min of moderate exercise 4-7 d/wk
    - promote cardiovascular fitness: increases insulin sensitivity, lowers BP, and improves lipid profile
  - if insulin treated, may require alterations of diet, insulin regimen, injection sites, and self-monitoring

Self-Monitoring of Blood Glucose

- type 1 DM: 3 or more self-tests/d is associated with a 1% reduction in HbA1c
- type 2 DM: recommendations vary based on treatment regimen (e.g. insulin dependent requires more frequent monitoring – refer to 2013 Canadian Practice Guidelines)
- if FBG >14 mmol/L, perform ketone testing to rule out DKA
- if bedtime level is <7 mmol/L, have bedtime snack to reduce risk of nocturnal hypoglycemia

Dietary Advice for Treatment of Type 2 DM in Adults

A meta-analysis, using 36 articles reporting a total of 18 trials following 1,467 participants, showed that there is no high quality data on the efficacy of dietary treatment of type 2 DM. After 6 and 12 mo, adoption of exercise improved HbA1c.

Calculated Total Insulin Required

<table>

</tr>
</tbody>
</table>

Calculate Total Insulin Required
**Figure 8. Types of insulin preparation**

![Diagram of plasma insulin levels over 24 hours after injection.](image)

**Clinical Assessment**

1. **Lifestyle intervention** (initiation of nutrition therapy and physical activity)
2. **HbA1c < 9.0%**
   - Initiate **metformin**
3. **HbA1c ≥ 9.0%**
   - Initiate **pharmacotherapy** immediately without waiting for effect from lifestyle interventions.
   - Consider initiating **metformin** concurrently with another agent from a different class; or initiate insulin
4. **Symptomatic hyperglycemia**
   - Initiate **insulin ± metformin**

**Add an agent best suited to the individual based on the advantages/disadvantages listed below**

<table>
<thead>
<tr>
<th>Class</th>

</tr>
</tbody>
</table>

**Timely adjustments**

- Add another drug from a different class; or
- Add bedtime basal insulin to other agent(s); or
- Intensify insulin regimen

**Figure 9. Management of hyperglycemia in type 2 diabetes**

Hypoglycemic Agents (Type 2 DM)
- oral
  - biguanide: metformin (Glucophage®)
  - thiazolidinedione: troglitazone (Rezulin®), rosiglitazone (Avandia®)
  - α-glucosidase inhibitor: acarbose (Precose®)
  - nonsulfonylureas: nateglinide (Starlix®), repaglinide (Gluconorm®)
  - sulfonylureas: glyburide (DiaBeta®), glimepiride (Amaryl®), gliclazide (Diamicron®)
  - DPP-4 inhibitor: sitagliptin (Januvia®)
- injectable
  - GLP-1 analogue: liraglutide (Victoza®)

Other Medications Used in DM
- ACEI or ARB in those with any of
  - clinical macrovascular disease
  - age ≥55 years
  - age <55 and microvascular complications
- statin in those with any of
  - clinical macrovascular disease
  - age ≥40 years
  - age <40 and any of the following:
    - diabetes duration >15 years and age >30 years
    - microvascular complications
    - other cardiovascular risk factors
- low dose ASA (81-325 mg)
  - for secondary prevention in people with established CVD (NOT to be used routinely for primary prevention)

Dizziness
- see Otolaryngology, OT12

Epidemiology
- 70% see general practitioners initially; 4% referred to specialists
- frequency proportional to age; commonest complaint of ambulatory patients age >75

Differential Diagnosis

![Dizziness Diagram](image)

Vertigo (vestibular)
- Objective (external world seems to revolve around individual) or subjective (individual revolves in space)
  - Central (15%)
    - Brainstem
    - Cerebellar
  - Peripheral (85%)
    - Inner ear
    - Vestibular nerve

Psychogenic
- Diagnosis of exclusion

Vascular
- Diagnosis of exclusion
  - Basilar migraine
  - TIA
  - Orthostatic hypotension
  - Stokes-Adams syndrome
  - Arrhythmia
  - CHF
  - Aortic stenosis
  - Vasovagal episodes
  - Metabolic causes

Ocular
- Decreased visual acuity

Figure 10. Differential diagnosis of dizziness

History
- clarify type of dizziness: vertigo, pre-syncope, disequilibrium, light-headedness
- duration (seconds, minutes, hours, days, weeks, or persistent)
- exacerbations
  - worse with head movement or eye closure (vestibular)
  - no change with head movement and eye closure (nonvestibular)
  - worse with exercise (cardiac/pulmonary causes)
• associated symptoms
  - neurologic (central)
    - transient diplopia, dysphagia, dysarthria, ataxia (TIA, VBI, migraine)
    - persistent headache, alterations in level of consciousness, sensory and/or motor deficits (CNS)
  - audiologic (peripheral)
    - hearing loss, tinnitus, otalgia, aural fullness
  - others
    - N/V (peripheral vestibular disorders)
    - SOB, palpitations (hyperventilation, cardiac problem)
• general medical history
  - HTN, DM, heart disease, fainting spells, seizures, cerebrovascular disease, migraines
  - ototoxic drugs: aminoglycosides (gentamicin, streptomycin, tobramycin), erythromycin, ASA, antimalarials
  - hypotension (secondary to diuresis): furosemide, caffeine, alcohol
  - depression/anxiety: can present with light-headedness

Physical Exam/Investigations
• syncopal
  - cardiac (orthostatic changes in vitals), peripheral vascular, and neurologic exams
  - blood work, ECG, 24 h Holter, treadmill stress test, loop ECG, tilt table testing, carotid, and vertebral doppler, EEG
• vertiginous
  - ENT and neurologic exams
  - Dix-Hallpike, consider audiometry and MRI if indicated
• non-syncopal, non-vertiginous
  - assess gait, vision and test for neuropathy
  - cardiac and neurologic exams
  - 3-min hyperventilation trial (patient is coached to hyperventilate until patient becomes dizzy to identify if symptoms are reproducible and confirm that hyperventilation is the etiology of the symptoms), ECG, EEG
  - Romberg test: test for disequilibrium (patient sways towards the side of vestibular dysfunction)

Treatment
• guided by history, physical exam, and investigations
• include education, lifestyle modification, physical maneuvers (e.g. Epley for BPPV), symptomatic management (e.g. antiemetics), pharmacotherapy, and surgery
• refer when significant central disease is suspected, when vertigo of peripheral origin is persistent (lasting >2-4 wk), or if atypical presentation

Domestic Violence/Elder Abuse

INTIMATE PARTNER VIOLENCE

Definition
• includes physical, sexual, emotional, psychological, and financial abuse
  (see Emergency Medicine, ER28)

Epidemiology
• lifetime prevalence of intimate partner violence against women is between 25-30%
• women who experience abuse have increased rates of injury, death, and health consequences including 50-70% increase in gynecological, central nervous system, stress-related problems
• occurs in all socioeconomic, educational, and cultural groups with increased incidence in pregnancy, disabled women, and 18-24 age group
• 25-50% chance of child abuse or neglect in families where partner abuse occurs
• physician recognition rates as low as 5%

Presentation
• multiple visits with vague, ill-defined complaints such as: headaches, gastrointestinal symptoms, insomnia, chronic pain, hyperventilation
• may also present with injuries inconsistent with history

Management
• screen ALL patients
  - always have a high index of suspicion
  - asking about abuse is the strongest predictor of disclosure
  - several screening tools (see sidebar) exist to identify victims of partner violence
  - make sure to determine the victim’s level of immediate and long-term danger and ask if there are weapons in the house
  - ensure patient safety
  - victim most at risk for homicide when attempting to leave home or following separation

Screening Instruments for Domestic Violence
A) Woman Abuse Screening Tool (WAST)-SHORT
  1. In general how would you describe your relationship?
     a. A lot of tension
     b. Some tension
     c. No tension
  2. Do you and your partner work out arguments with...?
     a. Great difficulty
     b. Some difficulty
     c. No difficulty
  Endorsing either question 1 (“a lot of tension”) or question 2 (“great difficulty”) makes intimate partner violence exposure likely

B) HITS
  How often does your partner:
  1. Physically hurt you?
  2. Insult you?
  3. Threaten you with harm?
  4. Scream or curse at you?
  Each question on HITS to be answered on a 5 point scale ranging from 1 (= never) to 5 (= frequently)
  A total score of 10.5 is significant
• provide community resources
  ▪ safety planning includes ensuring that there is access to an exit in the home, establishing a safe place to go and having money, clothes, keys, medications, important documents, and other emergency items prepared should the patient need to leave quickly
  ▪ shelter or helpline number with legal advocacy and counselling services
  ▪ involve social workers or domestic violence advocates
• appointment for follow-up to assess whether condition is better or worse
• reassure patient she/he is not to blame and that the assault is a crime
  ▪ goal is to convey the message that “As your doctor, I am concerned for your safety” and “Your partner has a problem that he/she needs help with” and “I want to help you”
  ▪ reporting suspected or known child abuse is mandatory
  ▪ spousal abuse is a criminal act, but not reportable without the woman’s/man’s permission
• DOCUMENT all evidence of abuse-related visits for medico-legal purposes

ELDER ABUSE
• see Geriatric Medicine, GM4

Dyspepsia
• see Gastroenterology, G10

Definition and Clinical Features
• defined as epigastric pain or discomfort
• can be associated with fullness, belching, bloating, heartburn, food intolerance, N/V

Epidemiology
• annual incidence 1-2%, prevalence 20-40%

Etiology
• common: functional, PUD, GERD, gastritis
• others: cholelithiasis, irritable bowel syndrome, esophageal or gastric cancer, pancreatitis, pancreatic cancer, Zollinger-Ellison syndrome, and abdominal angina

History
• symptoms may not be useful in finding cause
• association with food, anorexia, N/V, alcohol, NSAID use
• alarm symptoms: vomiting, bleeding/anemia, abdominal mass, dysphagia (VBAD)

Investigations and Management
• for new onset dyspepsia, test for H. pylori is commonly done using the urea breath test or serology
  ▪ upper endoscopy (preferred), upper GI series (not in patients with alarm symptoms)
  ▪ lifestyle modifications: dietary changes, smaller and more frequent meals, avoid supine position right after meals, decreased EtOH consumption, smoking cessation
  ▪ pharmacologic treatment
  ▪ gastric acid suppression: H₂ blockers, PPI’s; both are effective for PUD and GERD
  ▪ prokinetics: e.g. Metoclopramide; effective for functional dyspepsia
  ▪ H. pylori eradication
  ▪ do not keep patients on PPI without at least 1 trial off the medication per year.
• for non-responders, gastroscopy should be considered

Dyspnea
• see Respirology, R3 and Emergency Medicine, ER26

Definition
• term used to characterize a subjective experience of breathing discomfort

History and Physical Exam
• history
  ▪ cough, sputum, hemoptysis, wheezing, chest pain, palpitations, dizziness, edema
  ▪ asthma, allergy, eczema, ASA/NSAID sensitivity, nasal polyps
  ▪ constitutional symptoms
  ▪ smoking, recreational drugs, medications
  ▪ occupational exposure, environmental exposure (e.g. pets, allergens, smoke)
  ▪ travel and birth place
  ▪ FHx of atopy
  ▪ previous CXR or PFTs
• physical exam: vitals, respiratory, precordial, HEENT, signs of anemia/liver failure/heart failure

H. pylori Eradication
Take the following 10 day treatment
1) PPI 1 tablet 2x/d for 10 d and
2) Amoxicillin 1 g twice a day for 5 d (day 1-5)
Followed by
3) Clarithromycin 500 mg 2x/d (day 6-10) and
4) Metronidazole 500 mg 2x/d (day 6-10)

DDx of Dyspepsia
Pulmonary
• COPD
• Asthma
• Restrictive lung disease
• Pneumothorax
• Congenital lung disease
• PE

Cardiac
• CHF
• CAD
• MI (recent or past)
• Cardiomyopathy
• Valve dysfunction
• Pericarditis
• Arrhythmia
• Hypertrophy

Mixed/Other
• Deconditioning
• Trauma
• Pain
• Neuromuscular
• Metabolic condition
• Functional: anxiety, panic attack, hyperventilation
Investigations
- CXR, ECG
- PFTs, ABG acutely if indicated

Management
- ABCs: send to ED if in severe respiratory distress
- depends on cause

Dysuria
- see Urology, U10

Definition
- the sensation of pain, burning, or discomfort on urination

Epidemiology
- in adulthood, more common in women than men
- approximately 25% of women report one episode of acute dysuria per year
- most common in women age 25-54 and in those who are sexually active
- in men, dysuria becomes more prevalent with increasing age

Etiology
- infectious
  - most common cause
    - presents as cystitis, urethritis, pyelonephritis, vaginitis, cervicitis, epididymo-orchitis, or prostatitis
- non-infectious
  - hormonal conditions (hypoestrogenism), obstruction (BPH, urethral strictures), allergic reactions, radiation, drugs/chemicals, foreign bodies, trauma, neoplasm, kidney stones, inflammatory diseases, endometriosis, psychogenic

<td>E. coli, S. saprophyticus, Proteus mirabilis, Enterobacter, K. pneumoniae</td>
<td>Internal dysuria, fever, chills, flank pain radiating to groin, CVA tenderness, NV</td>
</tr>
</tbody>
</table>

Investigations
- no investigations necessary when history and physical consistent with uncomplicated UTI – treat empirically (urinalysis can be performed when indicated by dipstick or microscopy)
- urinalysis/dipstick: positive for nitrites and leukocytes
- urine R&M: pyuria, bacteriuria, hematuria
- urine C&S
- CBC and differential if suspecting pyelonephritis
- if vaginal/urethral discharge present: wet mount, Gram stain, KOH test, vaginal pH, culture for yeast and trichomonas, endocervical/urethral swab or urine PCR for N. gonorrhoeae and C. trachomatis
- radiologic studies and other diagnostic tests if atypical presentation
- see Pediatrics, P63 for UTI in children

Management
- UTI/cystitis
  - pregnant women with bacteriuria (2-7%) must be treated even if asymptomatic, due to increased risk of pyelonephritis, preterm labour, low birth weight and perinatal mortality; need to follow with monthly urine cultures and retreat if still infected
  - patients with recurrent UTIs (>3/yr) should be considered for prophylactic antibiotics
  - if complicated UTI, patients require longer courses of broader spectrum antibiotics
  - urethritis
    - when swab or PCR is positive for chlamydia or gonorrhea must report to Public Health
    - all patients should return 4-7 d after completion of therapy for clinical evaluation

Prevention of UTIs
- Maintain good hydration (especially with cranberry juice) (recommendation level I)
- Wipe urethra from front to back to avoid contamination of the urethra with feces from the rectum
- Avoid feminine hygiene sprays and scented douches
- Empty bladder immediately before and after intercourse

Cranberries for Preventing Urinary Tract Infections
- Cochrane DB Syst Rev 2008;1:CD00121
- Study: Meta-analysis of 10 RCTs (n=1,049).
- Patients: All populations.
- Intervention: Cranberry juice vs. placebo, juice or water was evaluated in seven studies, and cranberry tablets vs. placebo in four studies.
- Main Outcome: UTIs – symptomatic and asymptomatic.
- Results: Cranberry products significantly reduced the incidence of UTIs at 12 mo (RR 0.65, 95% CI 0.46-0.90) compared with placebo/control.
- Conclusion: There is some evidence that cranberry products may decrease the number of symptomatic UTIs over a 12 mo period, particularly for women with recurrent UTIs.
Epistaxis
• see Otolaryngology, OT27

Erectile Dysfunction
• see Urology, U30

Definition
• consistent or recurrent inability to attain and/or maintain penile erection sufficient for sexual performance of ≥3 mo duration

Epidemiology
• ~20% of men age 40; ~50% of men age 70

Etiology
• organic: vascular (90%) (arterial insufficiency, atherosclerosis), endocrine (low testosterone, DM), anatomic (structural abnormality, e.g. Peyronie's), neurologic (post-operative, DM), medications (clonidine, antihypertensives, psychotropics)
• psychogenic (10%)

Walsh: Campbell's Urology, 8th ed. Table 46-4

History
• comprehensive sexual, medical, and psychosocial history
• time course
  • last satisfactory erection
  • gradual or sudden onset
  • attempts at sexual activity
• quantify
  • presence of morning or night time erections
  • stiffness (scale of 1-10)
  • ability to initiate and maintain an erection with sexual stimulation
  • erection stiffness during sex (scale of 1-10)
• qualify
  • partner or situation specific
  • loss of erection before penetration or climax
  • degree of concentration required to maintain an erection
  • percentage of sexual attempts satisfactory to patient and/or his partner
  • significant bends in penis or pain with erection
  • difficulty with specific positions
  • impact on quality of life and relationship

Investigations
• hypothalamic-pituitary-gonadal axis evaluation: testosterone (free + total), prolactin, LH
• risk factor evaluation: fasting glucose, HbA1c, lipid profile
• others: TSH, CBC, urinalysis
• specialized testing
  • psychological and/or psychiatric consultation
  • in-depth psychosexual and relationship evaluation
  • nocturnal penile tumescence and rigidity (NPTR) assessment
  • vascular diagnostics (e.g. doppler studies, angiography)

Neurogenic (type 2 DM, post-operative)
Insufficiency of blood (atherosclerosis)
Substances

The Effect of Lifestyle Modification and Cardiovascular Risk Factor Reduction on Erectile Dysfunction
Arch Intern Med 2011;171:1797-1803
Study: Meta-analysis of 6 RCTs.
Population: 740 male participants.
Intervention: Lifestyle modification and pharmacotherapy targeting CAD risk factors.
Main Outcome Measure: International Index of Erectile Dysfunction (IIEF-5) score.
Results: Lifestyle modifications and pharmacotherapy for cardiovascular risk factors had a statistically significant association with improved sexual function (weighted mean difference 2.66; 95% CI 1.86-3.47). Lifestyle modification without use of statins was also statistically significantly associated with improved sexual function (weighted mean difference 2.40; 95% CI 1.19-3.61).
Conclusion: Lifestyle modification alone or combined with pharmacotherapy can improve sexual function.

Reasons for Referral to Urology
• Significant penile anatomic disease
• Younger patient with a history of pelvic or perineal trauma
• Cases requiring vascular or neurosurgical intervention
• Complicated endocrinopathies
• Complicated psychiatric or psychosocial problems
• Patient or physician desire for further evaluation

Fatigue

Epidemiology
- 25% of office visits to family physicians
  - peaks in ages 20-40
  - F:M = 3–4:1
- 50% have associated psychological complaints/problems, especially if <6 mo duration

Differential Diagnosis

Table 21. Differential Diagnosis of Fatigue: PS VINDICATE

| P | Psychogenic          | Depression, life stresses, anxiety disorder, chronic fatigue syndrome, fibromyalgia |
|   | Physiologic          | Pregnancy, caregiving demands (young children, elderly) |
| S | Sleep disturbance    | Obstructive sleep apnea, sleep disorder, poor sleep hygiene, BPH, shift work, pain |
|   | Sedentary            | Unhealthy/sedentary lifestyle |
| V | Vascular             | Stroke |
| I | Infectious           | Viral (e.g. mononucleosis, hepatitis, HIV), bacterial (e.g. TB), fungal, parasitic |
| N | Neoplastic           | Any malignancy |
|   | Nutrition            | Anemia (Fe<sup>2+</sup> deficiency, B<sub>12</sub> deficiency) |
|   | Neurogenic           | Myasthenia gravis, multiple sclerosis, Parkinson’s disease |
| D | Drugs                | β-blockers, antihistamines, anticholinergics, benzodiazepines, antiepileptics, antidepressants |
| I | Idiopathic           | |
| C | Chronic illnesses    | CHF, lung diseases (e.g. COPD, sarcoidosis), renal failure, chronic liver disease |
| A | Autoimmune           | SLE, RA, mixed connective tissue disease, polymyalgia rheumatica |
| T | Toxin                | Substance abuse (e.g. alcohol), heavy metal |
| E | Endocrine            | Hypothyroidism, DM, Cushing’s syndrome, adrenal insufficiency, pregnancy |

Common causes are in bold

Investigations
- psychosocial causes are common, so usually minimal investigation is warranted
- physical causes of fatigue usually have associated symptoms/signs that can be elicited from a focused history and physical exam
- investigations should be guided by history and physical exam and may include
  - CBC and differential, electrolytes, BUN, Cr, ESR, glucose, TSH, ferritin, vit B<sub>12</sub>, serum protein electrophoresis, Bence-Jones protein, albumin, AST, ALT, ALP, bilirubin, calcium, phosphate, ANA, β-hCG
  - urinalysis, CXR, ECG
  - additional tests: serologies (Lyme disease, hepatitis B and C screen, HIV, ANA) and Mantoux skin tests

Fatigue Red Flags
- Fever
- Weight loss
- Night sweats
- Neurological deficits
- Ill-appearing
Treatment
- treat underlying cause
- if etiology cannot be identified (1/3 of patients)
  - reassurance and follow-up, especially with fatigue of psychogenic etiology
  - quick follow-up for reassurance
  - supportive counselling, behavioural, or group therapy
  - encourage patient to stay physically active to maximize function
  - review all medications, OTC, and herbal remedies for drug-drug interactions and side effects
- prognosis: after 1 yr, 40% are no longer fatigued

CHRONIC FATIGUE SYNDROME

Definition (CDC 2006) – must meet both criteria
1. new or definite onset of unexplained, clinically evaluated, persistent or relapsing chronic fatigue, not relieved by rest, which results in occupational, educational, social, or personal dysfunction
2. concurrent presence of ≥4 of the following symptoms for a minimum of 6 mo
  - impairment of short-term memory or concentration, severe enough to cause significant decline in function
  - sore throat
  - tender cervical or axillary lymph nodes
  - muscle pain
  - multi-joint pain with no swelling or redness
  - new headache
  - unrefreshing sleep
  - post-exertion malaise lasting >24 h
- exclusion criteria: medical conditions that may explain the fatigue, certain psychiatric disorders (depression with psychotic or melancholic features, schizophrenia, eating disorders), substance abuse, severe obesity (BMI >45)

Epidemiology
- F>M, Caucasians > other groups, majority in their 30s
- found in <5% of patients presenting with fatigue

Etiology
- unknown, likely multifactorial
- may include infectious agents, immunological factors, neurohormonal factors, and/or nutritional deficiency

Investigations
- no specific diagnostic laboratory tests

Treatment
- promote sleep hygiene
- provide support and reassurance that most patients improve over time
- non-pharmacological
  - regular physical activity, optimal diet, psychotherapy (e.g. CBT), family therapy, support groups
- pharmacological
  - to relieve symptoms: e.g. antidepressants, anxiolytics, NSAIDs, antimicrobials, antiallergy therapy, antihypotensive therapy

Fever
- see Pediatrics, P53

Definition
- oral temperature >37.2°C (AM), 37.7°C (PM)
- fever in children under 2 must be a rectal temperature for accuracy
- TM not accurate for measurement until child is >5 yr
Table 22. Differential Diagnosis of Fever

History

- fever
  - peak temperature, thermometer, route, duration
  - time of day
  - response to antipyretics
- systemic symptoms
  - weight loss, fatigue, rash, arthralgia, night sweats
- symptoms of possible source
  - UTI/pyelonephritis: dysuria, foul-smelling urine, incontinence, frequency, hematuria, flank pain
  - pneumonia: cough, pleuritic chest pain
  - URTI: cough, coryza, ear pain
  - meningitis: headache, confusion, stiff neck, rash
  - osteomyelitis: bone pain
  - skin: purulent discharge
  - PID: discharge, dyspareunia, lower abdominal pain
  - gastroenteritis: abdominal pain, diarrhea, blood per rectum, vomit
  - medications
  - PE/DVT: swollen legs, pain in calf, SOB, pleuritic chest pain
  - history of cancer/family history of cancer
- infectious contacts
  - travel history, camping, day care, contact with TB, foodborne, animals

Possible Investigations

- CBC and differential, blood culture, urine culture, urinalysis
- stool O&P, Gram stain, culture
- CXR, Mantoux skin test, sputum culture
- LP

Management

- increase fluid intake
- general: sponge bath, light clothing
- acetaminophen/ibuprofen as needed
- treat underlying cause

Headache

- see Neurology, N45

Secondary Headaches
- caused by underlying organic disease
- account for <10% of all headaches, may be life-threatening

Etiology
- aneurysm
- medication overuse headache
- space-occupying lesion
- systemic infection (meningitis, encephalitis)
- stroke
- subarachnoid hemorrhage
- systemic disorders (thyroid disease, HTN, pheochromocytoma, etc.)
- temporal arteritis
- traumatic head injuries
- TMJ or C-spine pathology
- serious ophthalmological and otolaryngological causes of headache

Investigations
- indicated only when red flags are present and may include:
  - CBC for suspected systemic or intracranial infection
  - ESR for suspected temporal arteritis
  - neuroimaging (CT or MRI) to rule out intracranial pathology
  - CSF analysis for suspected intracranial hemorrhage, infection

Management
- based on underlying disorder
- analgesics may provide symptomatic relief

Hearing Impairment
- see Otolaryngology, OT9

Definition
- hearing impairment: a raised hearing threshold measured as decibels of hearing loss relative to the normal population at specific frequencies
- hearing disability: hearing impairment that interferes with performing daily tasks

Epidemiology
- prevalence increases with age (6% of 35-44 yr old, 43% of 65-84 yr old)
- 90% of age-related hearing loss (presbycusis) is sensorineural
- hearing loss detectable by audiology is present in greater than 1/3 of people >65 yr
- associated with significant physical, functional, and mental health consequences

Classification
- conductive (external sound does not reach the middle ear)
- sensorineural involving the inner ear, cochlea, or auditory nerve
- mixed

Assessment
- infants
  - universal newborn hearing screening program

Acupuncture for Migraine Prophylaxis
- Cochrane DB Syst Rev 2006;4:CD001218
- Study: Meta-analysis of 22 RCTs.
- Population: 4,419 participants with diagnosed migraine.
- Intervention: Preventive treatment with acupuncture, sham acupuncture, no prophylactic treatment/routine care only, other interventions.
- Main Outcome Measure: Proportion of responders in 3-4 mo.
- Other Outcomes: Frequency of migraine attacks, number of migraine days, headache frequency.
- Results: Patients receiving acupuncture had higher response rates and fewer headaches after 3-4 mo than those with no prophylactic treatment or routine care only. There was no statistically significant difference between "true" vs. "sham" acupuncture.
- Conclusion: Acupuncture is a viable prophylactic treatment option for migraine attacks. Selecting specific points for acupuncture is not as important as believed by practitioners.

Does this Patient have Hearing Impairment?
- JAMA 2006;295:416-428
- Purpose: To evaluate bedside clinical maneuvers used to evaluate the presence of hearing impairment.
- Study: Evidence-based review of studies examining the accuracy or precision of screening questions and tests. 21 studies were included in this analysis.
- Conclusions: Elderly patients who admit to having hearing impairment should be offered audiometry, while those who do not should undergo a whispered-voice test. Those who hear the whispered voice require no further testing, while those who do not require audiometry. The Weber and Rinne tests are not useful in screening for hearing impairment.
• elderly
  • presbycusis is characterized by the progressive, symmetric loss of high-frequency hearing
    • tinnitus, vertigo, and disequilibrium may be present
    • can cause low self-esteem, isolation, and depression
  • whispered-voice test
    • whisper 6 test words 6 in-2 ft away from the patient's ear out of the visual field, ask
      patient to repeat the words (with non-test ear distraction)
  • tuning fork test (to distinguish conductive from sensorineural hearing loss)
    • Rinne and Weber (not for general screening)
  • formal audiologic assessment
    • pure tone, air, and bone conduction testing
    • speech audiometry
    • impedance audiometry

Management
• counsel about noise control and hearing protection programs (Grade A evidence)
• investigations in patients with unexplained sensorineural hearing loss
  • blood sugar, CBC+ differential, TSH, syphilis testing
• referral
  • refer patients with hearing loss for a complete audiological examination
  • unclear etiology of hearing loss: referral to ENT
• sudden hearing loss: urgent referral as treatment success is related to early treatment
• patients with progressive asymmetric sensorineural hearing loss should have an MRI/CT scan to
  exclude vestibular schwannoma (acoustic neuroma)
• hearing amplification (e.g. hearing aids), assistive listening devices, and cochlear implants can
  dramatically improve quality of life

Hypertension

Hypertension Guidelines are reviewed and updated annually, for up-to-date recommendations, please see www.hypertension.ca/chep

Epidemiology
• 22% of Canadian adults suffer from HTN (prevalence is 52% in the 60-70 age group)
• lifetime risk of developing hypertension is approximately 90%
• 64% of Canadians who have HTN are treated and controlled, while 17% are unaware that they
  have HTN
• 3rd leading risk factor associated with death
  • risk factor for CAD, CHF, cerebrovascular disease, renal failure, peripheral vascular disease

Definitions
• HTN
  • BP ≥140/90 mmHg, unless DM (≥130/80 mmHg), or age ≥80 yr (≥150/90 mmHg)
• isolated systolic HTN
  • sBP ≥140 and dBP <90
  • associated with progressive reduction in vascular compliance
  • usually begins in 5th decade
• hypertensive urgency
  • sBP >210 or dBP >120 with minimal or no target-organ damage
• hypertensive emergency
  • severe HTN + acute target-organ damage
• accelerated HTN
  • significant recent increase in BP over previous hypertensive levels associated with
    evidence of vascular damage on fundoscopy, but without papilledema
• malignant HTN
  • sufficient elevation in BP to cause papilledema and other manifestations of vascular
    damage (retinal hemorrhages, bulging discs, mental status changes, increasing creatinine)
• white coat hypertension
  • high clinic BP with normal home BP and 24 ambulatory BP, caused by anxiety in clinic
• masked hypertension
  • normal clinic BP with high BP in home and/or ambulatory setting, often provoked by
    anxiety, job stress, exercise

Etiology
• essential (primary) HTN (>90%)
• undetermined cause
• secondary HTN (10%)
Predisposing Factors

- family history
- obesity (especially abdominal)
- alcohol consumption
- stress
- sedentary lifestyle
- smoking
- male
- age >30
- excessive salt intake/fatty diet
- African American ancestry
- dyslipidemia

Table 24. Causes of Secondary HTN

<table>
<thead>
<tr>

</tr>
<tr>
<td>Vascular</td>
<td>Cocaine Estrogens/OCP MAOIs Lithium Amphetamines NSAIDs Decongestants Alcohol</td>
</tr>
</tbody>
</table>

Investigations

- for all patients with HTN
  - electrolytes, Cr, fasting glucose and/or HbA1c, lipid profile, 12-lead ECG, urinalysis
  - self-measurement of BP at home is encouraged (recommended devices listed at www.hypertension.ca)
- for specific patient subgroups
  - DM or chronic kidney disease: urinary protein excretion
  - if suspected renovascular HTN: renal ultrasound, captopril renal scan (if GFR >60 mL/min), MRA/CTA (if normal renal function)
  - if suspected endocrine cause: plasma aldosterone, plasma renin
    - measured from morning samples taken from patients in sitting position after resting 15 min
    - discontinue aldosterone antagonists, ARBs, β-blockers, and clonidine prior to testing
  - if suspected pheochromocytoma: 24 h urine for metanephrines and creatinine
  - echocardiography for left ventricular dysfunction assessment if indicated

Diagnosis

- all Canadian adults should have BP assessed at all appropriate clinical visits, oscillometric preferred to manual
Figure 11. Assessment of patients with hypertension

Adapted from: CHEP 2015 Guidelines

Treatment
- treat to target BP: <140/90 mmHg, <130/80 mmHg if DM, sBP<150 in very elderly (>80 yrs)
- optimum management of hypertension requires assessment of overall cardiac risk
- lifestyle modification (in all HTN patients)
  - may be sufficient in patients with stage 1 HTN (140-159/90-99)
  - diet
    - follow Canada’s Guide to Healthy Eating (see Nutrition, FM6) and Dietary Approaches to Stop Hypertension (DASH) (reduced cholesterol and saturated fats)
    - limit daily sodium intake to 65-100 mmol (1.5-2.3 g)
    - potassium/magnesium/calcium supplementations are NOT recommended for HTN
    - moderate intensity dynamic exercise: 30-60 min, 4-7 x/wk; higher intensity exercise is no more effective
    - smoking cessation
    - stress management
    - low-risk alcohol consumption (see Alcohol, FM13)
    - achieve and maintain a healthy BMI (18.5-24.9 kg/m²) and waist circumference (<102 cm for men, <88 cm for women); use multidisciplinary approach to weight loss
    - individualized cognitive behavioural interventions for stress management
- pharmacological
  - indications regardless of age (caution with elderly patients)
    - dBP ≥90 mmHg with target organ damage or independent cardiovascular risk factors
    - dBP ≥100 mmHg or sBP ≥160 mmHg without target organ damage or cardiovascular risk factors
    - sBP ≥140 with target organ damage
  - first line antihypertensives: thiazide/thiazide-like diuretic, ACEI (for non-African patients), ARB, long-acting CCB, β-blocker (if age <60)
  - if partial response to standard dose monotherapy, add another first-line drug
  - caution with combination of non-DHP CCB and β-blocker
  - combination of ACEI and ARB is not recommended
  - be cautious of hypokalemia in patients treated with thiazide/thiazide-like diuretic monotherapy
  - if still not controlled or adverse effects, can add other classes of anti-hypertensives
  - focus on adherence to health behavior modification and pharmacotherapy; should be assessed at each visit

**Thiazides as First-Line Antihypertensive Therapy – ALLHAT**

**Study:** Randomized, double-blind, active-controlled clinical trial with mean follow-up of 4.9 yr.
**Patients:** 33,957 participants (mean age 67 yr, 52% male, 47% white) with stage 1 or 2 HTN and at least one other CHD risk factor.
**Intervention:** Participants were randomly assigned to receive chlorthalidone (12.5-25 mg/d), amlodipine (2.5-10mg/d), or lisinopril (10-40 mg/d). Target BP was <140/90 mmHg, achieved by titrating the assigned study drug, and adding open-label agents when necessary.
**Outcomes:** The primary outcome was combined fatal CHD or non-fatal MI. Secondary outcomes were all-cause mortality, stroke, combined CHD, and combined CVD.
**Results:** There were no significant differences in either the primary outcome or all-cause mortality between treatment groups. For amlodipine vs. chlorthalidone, secondary outcomes were similar except for a higher 6 yr rate of heart failure with amlodipine (10.2% vs. 7.7%; p<0.001). For lisinopril vs. chlorthalidone, lisinopril had higher 6 yr rates of combined CVD (33.3% vs. 30.9%; p<0.001), stroke (6.3% vs. 5.0%; p<0.002) and heart failure (6.7% vs. 7.7%; p<0.001).
**Conclusion:** Thiazide-type diuretics are superior to CCB and ACEI for preventing one or more major forms of CVD, with similar risks of death and non-fatal MI.

Follow-Up
- assess and encourage adherence to pharmacological and non-pharmacological therapy at every visit
- lifestyle modification → q3-6mo
- pharmacological
  - q1-2mo until BP under target for 2 consecutive visits
  - more often for symptomatic HTN, severe HTN, antihypertensive drug intolerance, target organ damage
  - q3-6mo once at target BP
- referral is indicated for cases of refractory HTN, suspected secondary cause or worsening renal failure
- hospitalization is indicated for malignant HTN

</table>

History
- number of joints involved: monoarticular, oligoarticular, polyarticular
- pattern of joints involved: symmetrical vs. asymmetrical, large vs. small joints, axial skeleton
- onset: acute vs. chronic (>6 wk)
- trauma, infection, medications (steroids, diuretics)
- morning stiffness (duration) vs. worse at end of day
- FHx of arthritis
- comorbidities: DM (carpal tunnel syndrome), renal insufficiency (gout), psoriasis (psoriatic arthritis), myeloma (low back pain), osteoporosis (fracture), obesity (OA)
- constitutional symptoms (neoplasm)

Physical Exam
- vitals
- specific joint exams
- systemic features (skin, nails, eyes, hands)

Investigations (Guided by the History and Physical Exam)
- general: CBC and differential, electrolytes, Cr
- acute phase reactants: ESR, CRP, ferritin, albumin, fibrinogen
- complement (C3, C4)
- urinalysis to detect disease complications (proteinuria, active sediment)
- serology (ANA, anti-dsDNA, HLA-B27, anti-Jo-1, anti-Sm, anti-La, anti-Ro, RhF, and anti-CCP, etc.)
- synovial fluid analysis (cell count + differential, culture, Gram stain, microscopy)
- tissue cultures
- radiology (plain film, CT, MRI, U/S, bone densitometry, angiography, bone scan)

Signs and Symptoms of Inflammatory Arthritis
- WARM(S) Joints
  - Worse with rest, better with activity
  - Awakening in the latter half of the night
  - Redness around joint
  - Morning stiffness (>30 min)
  - Soft tissue swelling, erythema
Treatment

- patient education including lifestyle modifications
- physiotherapy, occupational therapy
- manage pain (acetaminophen, NSAIDs)
- treat specific causes (e.g. antibiotics, DMARDs etc., see Rheumatology, RH30)

Low Back Pain

- see Orthopedics, OR24

Definition

- acute: <6 wk
- subacute: 6-12 wk
- chronic: >12 wk

Epidemiology

- 5th most common reason for visiting a physician
- lifetime prevalence: 90%
- peak prevalence: age 45-60
- largest WSIB category
- most common cause of chronic disability for individuals <45 yr old
- 90% resolve in 6 wk, <5% become chronic

Etiology

- source of pain can be local, radicular, referred, or related to a psychiatric illness
- 98% are mechanical causes
  - pain is worse with movement, better with rest
  - sprain (ligament), strain (muscle), facet joint degeneration, disc degeneration/herniation, spinal stenosis (e.g. spondylosis), spondylolisthesis, compression fracture, pregnancy
- 2% are non-mechanical causes
  - surgical emergencies
  - cauda equina syndrome (areflexia, lower extremity weakness, decreased anal tone, saddle anesthesia, fecal incontinence, urinary retention), AAA (pulsatile abdominal mass)
  - medical conditions
    - neoplastic (primary, metastatic, multiple myeloma)
    - infectious (osteomyelitis, TB)
    - metabolic (osteoporosis, osteomalacia, Paget’s disease)
    - rheumatologic (ankylosing spondylitis, polymyalgia rheumatica)
    - referred pain (perforated ulcer, pancreatitis, pyelonephritis, ectopic pregnancy, herpes zoster)

Physical Exam

- inspection: curvature, posture, gait
- palpation: bony deformities/tenderness, paraspinal muscle bulk/tenderness, trigger points
  - percussion of spine to elicit pain due to fracture or infection
- ROM and peripheral pulses
- neurologic exam for L4/L5/S1 helps determine level of spinal involvement (power, reflexes, sensation)
- special tests
  - straight leg raise (positive if pain at <70 degrees and aggravated by ankle dorsiflexion), positive test is indicative of sciatica
  - crossed straight leg raise (raising of uninvolved leg elicits pain in leg with sciatica), more specific than straight leg raise
  - femoral stretch test (patient prone, knee flexed, examiner extends hip) to diagnose L4 radiculopathy

Investigations

- plain films not recommended in initial evaluation
- if infection/cancer suspected: CBC, ESR
- if neurologic deficits worsening or infection/cancer suspected: consider CT or MRI
A Summary of the Guideline for the Evidence-Informed Primary Care Management of Low Back Pain

**Red Flags** help identify rare, but potentially serious conditions. They include:
- Features of Cauda Equina Syndrome including sudden onset of loss of bladder/bowel control, saddle anesthesia (EMERGENCY)
- Severe worsening pain, especially at night or when lying down (URGENT)
- Significant trauma (URGENT)
- Weight loss, history of cancer, fever (URGENT)
- Use of steroids or intravenous drugs (URGENT)
- Patient with first episode over 50 years old, especially over 80 (SSOON)
- Widespread neurological signs (SSOON)

**EMERGENCY** — referred within hours
**URGENT** — referred within 24 – 48 hours
**SSOON** — referred within weeks

**Yellow Flags** indicate psychosocial barriers to recovery. They include:
- Belief that pain and activity are harmful
- Sickness behaviour* (like extended rest)
- Low or negative mood, social withdrawal
- Treatment expectations that do not fit best practice
- Problems with claim and compensation
- History of back pain, time-off, other claims
- Problems at work, poor job satisfaction
- Heavy work, unachievable hours (shift work)
- Overprotective family or lack of support

Menopause/Hormone Replacement Therapy

- see Gynecology, GY34

Epidemiology
- mean age of menopause = 51.4 yr

Clinical Features
- associated with estrogen deprivation
- urogenital tract: atrophy, vaginal dryness/itching, urinary frequency/urgency/incontinence, bleeding
- blood vessels and heart: vasomotor instability (e.g., hot flashes), increased risk of heart disease
- bones: bone loss, joint/muscle/back pain, fractures, loss of height
- brain: depression, irritability, mood swings, memory loss

Management
- encourage physical exercise, smoking cessation, and a balanced diet with adequate intake/supplementation of calcium (1,200-1,500 mg/d) and vitamin D (800-2,000 IU/d)
- hormone replacement therapy (HRT)
  - prescribe for moderate to severe symptoms for no longer than 5 yr; routine use is not recommended
  - regimens: cyclic estrogen-progestin, continuous estrogen-progestin, estrogen only (if no uterus), estrogen patch/gel/cream/ring/vaginal tablet
  - decreases risk of osteoporotic fractures, colorectal cancer
  - increases risk of breast cancer, coronary heart disease, stroke, DVT, and PE
  - initiation of HRT requires a thorough discussion of short- and long-term benefits and risks
- consider venlafaxine, SSRIs, or gabapentin to ease vasomotor instability

Osteoarthritis

- see Rheumatology, RH5

Epidemiology
- most common form of arthritis seen in primary care
- prevalence is 10-12% and increases with age
- results in long-term disability in 2-3% of patients with OA
- almost everyone over the age of 65 shows signs of OA on x-ray, but only 33% of these individuals will be symptomatic

Clinical Features
- joint pain with activity, improved with rest, morning stiffness or gelling <30 min
- deformity, bony enlargement, crepitus, limitation of movement, peri-articular muscle atrophy
- usually affects distal joints of hands, spine, hips, and knees

Investigations
- no laboratory tests for the diagnosis of OA
- hallmark radiographic features: joint space narrowing, subchondral sclerosis, subchondral cysts, osteophytes

Management
- goals: relieve pain, preserve joint motion and function, prevent further injury
- conservative
  - patient education, weight loss, low-impact exercise (OT/PT), assistive devices (e.g., canes, orthotics, raised toilet seats)
- pharmacological
  - consider comorbidities such as PUD, HTN, IHD, hepatic disease, and renal disease
  - medications do not alter natural course of OA
  - 1st line: acetaminophen up to 4 g/d (OA is not an inflammatory disorder)
  - 2nd line: NSAIDs in the lowest effective dose for the shortest duration of time, along with gastroprotection; COX-2 selective inhibitors (celecoxib/Celebrex®) are recommended if long-term treatment or if high risk for serious GI problems
  - combination analgesics (e.g., acetaminophen and codeine)
  - intra-articular hyaluronic acid injections
  - intra-articular corticosteroid injections (no more than 3-4x/yr) may be helpful in acute flares (benefits last 4-6 wk, can be up to 6 mo)
  - topical NSAID (diclofenac/Pennsaid®)
  - capsaicin cream (Zostrix®)
  - oral glucosamine
  - surgery
  - consider if persistent significant pain and functional impairment despite optimal pharmacotherapy (e.g., debridement, osteotomy, total joint arthroplasty)

Glucosamine Therapy for Treating Osteoarthritis
This meta-analysis of 25 single- and double-blinded randomized controlled trials with 4,863 patients compared glucosamine treatment, administered by any route, against placebo or another treatment.

Conclusions: Glucosamine can decrease pain and functional impairment resulting from OA and is not associated with any side effects compared to placebo. Differences in the effectiveness of Rotta and non-Rotta preparations highlight variability between glucosamine preparations and patients should be made aware of this.
Osteoporosis

- see Endocrinology, E42
- for current guidelines and tools see www.osteoporosis.ca
- age-related disease characterized by decreased bone mass and increased susceptibility to fractures
- affects 1 in 4 Canadian women and 1 in 8 Canadian men

For more information, see the Endocrinology section (E42) and visit the website www.osteoporosis.ca for current guidelines and tools.

Disorders Strongly Associated with Osteoporosis Include:
- Primary hyperparathyroidism, type 1 DM, osteogenesis imperfecta, uncontrolled hyperthyroidism, hypogonadism or premature menopause (<45 yr), Cushing’s disease, chronic malnutrition or malabsorption, chronic liver disease, COPD, and chronic inflammatory conditions (e.g. IBD)

10 Yr Fracture Risk Assessment
- FRAX (WHO Fracture Risk Assessment Tool) and CAROC (Canadian Association of Radiologists and Osteoporosis Canada) have been validated in the Canadian Population
- FRAX and CAROC are available online from: https://www.osteoporosis.ca/

How much Calcium do we Need?

<table>
<thead>
<tr>
<th>Age</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>4-8</td>
<td>1,000 mg</td>
</tr>
<tr>
<td>9-18</td>
<td>1,300 mg</td>
</tr>
<tr>
<td>19-50</td>
<td>1,200 mg</td>
</tr>
<tr>
<td>&gt;50</td>
<td>1,200 mg</td>
</tr>
<tr>
<td>Pregnant and lactating women</td>
<td>1,000 mg</td>
</tr>
<tr>
<td>19-50</td>
<td></td>
</tr>
</tbody>
</table>

Calcium Content of Common Foods

- 1 cup milk = 300 mg
- ½ cup yogurt = 332 mg
- ½ can salmon with bones = 240 mg
- ½ cup cooked broccoli = 33 mg
- 1 medium orange = 50 mg

Vitamin D Content in Food

- Milk fortified with vitamin D3 contains 100 IU's per 250 mL glass
- Foods such as margarine, eggs, chicken livers, salmon, sardines, herring, mackerel, swordfish, and fish oils (halibut and cod liver oils) all contain small amounts; supplementation is necessary to obtain adequate levels as dietary intake has minimal impact
- Most multivitamins provide 400 IU's of vitamin D3

Palliative and End-of-Life Care

- see Geriatric Medicine, GM12

Figure 14. 2010 Clinical practice guidelines for the diagnosis and management of osteoporosis in Canada (integrated management model). Adapted from: CMAJ 2010;182:1864-1873
### Rash

**ATOPIK DERMATITIS**
- **clinical features**
  - affects all ages but is more common in children
  - pruritus is the most common symptom; scratching worsens the rash creating a vicious cycle
- **treatment**
  - goals: limit itching, repair skin
  - moisturizers, emollients, topical corticosteroids; oral corticosteroids and topical calcineurin inhibitors may be used

**SEBORREIC DERMATITIS**
- **clinical features**
  - affects all ages but is most common in infants within the first 3 mo of life (e.g. pityriasis capitis or "cradle cap") and adults age 30-60 yr
  - affects the scalp, central face, and anterior chest; often presents as scalp scaling (dandruff) in adolescents and adults
  - may cause mild to marked erythema of the nasolabial fold, often with greasy scaling
- **treatment**
  - topical antifungals, topical low-potency steroids; topical calcineurin inhibitors may be used

**ROSACEA**
- **clinical features**
  - stages: (1) facial flushing, (2) erythema and/or edema and ocular symptoms, (3) papules and pustules, (4) rhinophyma
- **treatment**
  - topical or oral antibiotics, oral retinoids
  - laser treatment may be an option for progressive telangiectasias or rhinophyma
  - referral may be required to manage rhinophyma, ocular complications, or severe disease

**ACNE VULGARIS**
- **clinical features**
  - types: (I) comedonal, (II) papular, (III) pustular, (IV) nodulocystic
  - predilection for the face, neck, upper chest, and back
- **treatment**
  - mild acne: topical treatments (antibiotics, benzoyl peroxide, retinoids)
  - moderate acne: after topical treatments have failed, add oral antibiotics and consider hormonal therapy
  - severe acne: consider systemic retinoids

**ONYCHOMYCOSIS (TINEA UNGUIUM)**
- **definition**: fungal infection of the nail bed, matrix, or plate
- **clinical features**
  - occurs primarily in adults, most commonly after age 60
  - crumbling, distally dystrophic nails; yellowish, opaque with subungual hyperkeratotic debris
  - toenails are affected more often than fingernails
- **investigations**
  - microscopy of subungual scrapings under KOH preparation, culture
- **treatment**
  - oral antifungals (terbinafine/Lamisil®, itraconazole/Sporanox®), topical antifungals (ciclopirox/Loprox®) are less effective
Sexually Transmitted Infections

- see Gynecology, GY27

**Definition**
- diverse group of infections caused by multiple microbial pathogens
- transmitted by either secretions or fluids from mucosal surfaces

**Epidemiology**
- high incidence rates worldwide
- Canadian prevalence in clinical practice
  - common: chlamydia (most common), gonorrhea (2nd most common), HPV, genital herpes (increasing incidence of chlamydia and gonorrhea)
  - less common: hepatitis B, HIV, and syphilis (increasing in incidence), trichomoniasis
  - rare: chancroid, granuloma inguinale, lymphogranuloma venereum
- non-sexually transmitted genital tract infections: vulvovaginal candidiasis (VVC), bacterial vaginosis (BV)
- three most common infections associated with vaginal discharge in adult women are BV, VVC, and trichomoniasis

**History**
- sexual history
  - age of first intercourse, sexual orientation, sexual activity (oral, anal, and/or vaginal intercourse), sexual activity during travel
  - total number of partners in the past year/month/week and duration of involvement with each
- STI history
  - STI awareness, contraception, previous STIs and testing (including Pap tests), partner communication regarding STIs
  - local symptoms such as burning, itching, discharge, sores, vesicles, testicular pain, dysuria, abdominal pain
  - systemic symptoms such as fever, lymphadenopathy, arthralgia

**Investigations/Screening**
- individuals at increased risk, even those who are asymptomatic, should be screened for chlamydia, gonorrhea, hepatitis B, HIV, and syphilis
- Pap test if none performed in the preceding 12 mo

**Management**
- primary prevention is vastly more effective than treating STIs and their sequelae
- offer hepatitis B vaccine if not immune
- offer Gardasil® to women over 9 years of age (can be offered to men as well but not covered by OHIP)
- discuss STI risk factors (e.g. decreasing the number of sexual partners)
- direct advice to ALWAYS use condoms or to abstain from intercourse
- condoms are not 100% effective against HPV or HSV
- an STI patient is not considered treated until the management of his/her partner(s) is ensured (contact tracing by Public Health)
- patients diagnosed with bacterial STI or trichomonal infection should abstain from sexual activity until treatment completion and for 7 d after treatment for both partners, or until test of cure completed
- mandatory reporting: chlamydia, gonorrhea, hepatitis B, HIV, syphilis

**STI Risk Factors**
- Sexually active males and females
- Unprotected sex, sexual contact with a known case of STI, previous STI
- New sexual partner or > 2 sexual partners in the past 12 mo
- Street involved, homeless, and/or substance abuse

**Efficacy of Human Papillomavirus Vaccines – A Systematic Quantitative Review**
*Int J Gynecol Cancer* 2009;19:1166-1176

**Study:** Systematic review of 6 randomized placebo-controlled double-blind trials.

**Patients:** 47,236 women between ages 9-26.

**Intervention:** Vaccination with HPV L1 virus-like particle in either quadrivalent (HPV 6, 11, 16, 18), bivalent (HPV 16, 18), or univalent (HPV 16) form vs. placebo.

**Main Outcome:** Prevention of cytologically and/or histologically proven lesions (including LSIL, HSIL, VIN, VAIN, AVN, adenocarcinoma in situ of the cervix, or cancer of the cervix associated with HPV infection).

**Results:** Bivalent and quadrivalent vaccines reduced the rate of lesions in the cervix, vulva, vagina, and anogenital region with efficacy of 93% and 62%, respectively.
Sinusitis

- see Otolaryngology, OT25

Etiology
- viral etiology is more common
- viral: rhinovirus, influenza, parainfluenza
- bacterial: S. pneumoniae, H. influenzae, M. catarrhalis

Management of Acute Sinusitis
- may provide symptom relief: oral analgesics (acetaminophen, NSAIDs), nasal saline rinse, short-term use of topical or oral decongestants
- do not prescribe antihistamines
- intra-nasal corticosteroids if diagnosed with mild to moderate acute bacterial sinusitis
- antibiotics and intra-nasal corticosteroids if diagnosed with severe acute bacterial sinusitis
- ENT referral if: anatomic defect (e.g. deviated septum, polyp, adenoid hypertrophy), failure of second-line therapy, ≥4 episodes/yr, development of complications (e.g. mucocele, orbital extension, meningitis, intra-cranial abscess, venous sinus thrombosis)

Red Flags for Urgent Referral
- Altered mental status
- Headache
- Systemic toxicity
- Swelling of the orbit or change in visual acuity or EOM
- Hard neurological findings
- Signs of meningeal irritation
- Suspected intra-cranial complications (meningitis, intra-cranial abscess, cavernous sinus thrombosis)
- Involvement of associated structures (periorbital cellulitis, Pett’s puffy tumour)
Sleep Disorders

- see Respirology, R31 and Neurology, N48

Definition
- most often characterized by one of three complaints
  - insomnia
    - difficulty falling asleep, difficulty maintaining sleep, early-morning wakening, non-refreshing sleep
  - parasomnias
    - night terrors, nightmares, restless leg syndrome, somnambulism (performing complex behaviour during sleep with eyes open but without memory of event)
    - excessive daytime sleepiness

Epidemiology
- 1/3 of patients in primary care setting have occasional sleep problems, 10% have chronic sleep problems
Etiology

- primary sleep disorders
  - primary insomnia, narcolepsy, obstructive sleep apnea, restless leg syndrome, periodic limb movements of sleep
- secondary causes
  - medical: COPD, asthma, CHF, hyperthyroidism, chronic pain, BPH, menopause, GERD, PUD, pregnancy, neurological disorders
  - drugs: alcohol, caffeine, nicotine, nicotine replacement therapy, β-agonists, antidepressants, steroids
  - psychiatric: mood and anxiety disorders
  - lifestyle factors: shift work, jet-lag

Investigations

- complete sleep diary every morning for 1-2 wk
  - record bedtime, sleep latency, total sleep time, awakenings, quality of sleep
- rule out specific medical problems (e.g. CBC and differential, TSH)
- refer for sleep study, nocturnal polysomnogram, or daytime multiple sleep latency test if suspicion of sleep apnea or periodic leg movements of sleep

Treatment of Specific Problems

- primary insomnia
  - majority of cases
  - person reacts to insomnia with fear or anxiety around bedtime or with a change in sleep hygiene, which can progress to a chronic disorder (psychophysiological insomnia)
  - treat any suspected medical or psychiatric cause
  - behaviour-based treatment
    - sleep hygiene: avoid alcohol, caffeine, nicotine; comfortable sleep environment; regular sleep schedule; no napping
    - exercise regularly, avoid heavy exercise within 3 h of bedtime
    - relaxation therapy: deep breathing, meditation, biofeedback
    - stimulus control therapy: re-association of bed/bedroom with sleep, re-establishment of a consistent sleep-wake schedule, reduce activities that cue staying awake
    - sleep restriction therapy: total time in bed should closely match the total sleep time of the patient (improves sleep efficacy)
    - CBT: address inappropriate beliefs and attitudes that perpetuate dysfunctional sleep
  - pharmacologic treatment
    - short-acting benzodiazepines (e.g. lorazepam, oxazepam, temazepam) at the lowest effective dose should be used <7 consecutive nights to break cycle of chronic insomnia or to manage an exacerbation of previously controlled primary insomnia
    - non-benzodiazepines: zopiclone (Imovane®), zolpidem (Sublinox®), melatonin, low dose anti-depressants with sedating properties (amitriptyline, trazadone, mirtazapine)
    - follow-up every 2-4 wk initially (to reinforce behavioural interventions and renew/consider pharmacotherapy) then every 3 mo; if no progress or limited improvement, consider referral to sleep medicine program

- snoring
  - results from soft tissue vibration at the back of the nose and throat due to turbulent airflow through narrowed air passages
  - physical exam: obesity, nasal polyps, septal deviation, hypertrophy of the nasal turbinates, enlarged uvula and tonsils
  - investigations (only if severely symptomatic): nocturnal polysomnography and airway assessment (CT/MRI)
  - treatment
    - sleep on side (position therapy), weight loss
    - nasal dilators (noninvasive external dilator made with elastic adhesive backing applied over nasal bridge), tongue-retaining devices, mandibular advancement devices
  - at risk of developing obstructive sleep apnea

- obstructive sleep apnea (OSA)
  - apnea (no breathing for ≥10 s) resulting from upper airway obstruction due to collapse of the base of the tongue, soft palate with uvula, and epiglottis; respiratory effort is present
  - leads to a distinctive snorting, choking, awakening type pattern as the body rouses itself to open the airway (resuscitative breath)
  - apneic episodes can last from 20 s-3 min and occur 100-600 episodes/night
  - diagnosis is based on nocturnal polysomnography: >15 apneic/hypopneic episodes per hour of sleep with arousal recorded
  - consequences
    - daytime somnolence, non-restorative sleep
    - poor social and work performance
    - mood changes: anxiety, irritability, depression
    - sexual dysfunction: poor libido, impotence

Risk Factors for Obstructive Sleep Apnea

- 2% of women, 4% of men between ages 30-60
- Obesity (due to upper airway narrowing): BMI >28 kg/m² present in 60-90% of cases
- Children (commonly due to large tonsils and adenoids)
- Aging (due to decreased muscle tone)
- Persistent URTIs, allergies, nasal tumours, hypothyroidism (due to macroglossia), neuromuscular disease
- Family history
morning headache (due to hypercapnia)
HTN (2x increased risk), CAD (3x increased risk), stroke (4x increased risk), arrhythmias
OSA is an independent risk factor for CAD
pulmonary HTN, right ventricular dysfunction, cor pulmonale (due to chronic hypoxemia)
memory loss, decreased concentration, confusion
investigations
evaluate BP, inspect nose and oropharynx (enlarged adenoids or tonsils)
blood gas not helpful, TSH if clinically indicated
nocturnal polysomnography
treatment
modifiable factors: avoid sleeping supine; weight loss; avoid alcohol, sedatives, opioids; inhaled steroids if nasal swelling present; dental appliances to modify mandibular position
primary treatment of OSA is CPAP: maintains patent airway in 95% of OSA cases
surgery: somnoplasty, uvulopalatopharyngoplasty (UPPP), tonsillectomy, and adenoidectomy (in children)
report patient to Ministry of Transportation if OSA is not controlled by CPAP

Sore Throat (Pharyngitis)

Definition
- inflammation of the oropharynx
- may be caused by a wide range of infectious organisms, most of which produce a self-limited infection with no significant sequelae

Etiology
- viral: adenovirus, rhinovirus, influenza virus, RSV, EBV, coxsackie virus, herpes simplex virus, CMV, HIV
- bacterial: group A β-hemolytic Streptococcus (GABHS), group C and group β-hemolytic Streptococcus, Neisseria gonorrhoeae, Chlamydia pneumoniae, Mycoplasma pneumoniae, Corynebacterium diphtheriae

Epidemiology
- viral
  - most common cause (90% in adults is viral), occurs year round
- bacterial
  - GABHS (Group A β-Hemolytic Streptococcal Infections)
    - most common bacterial cause
    - occurs most often in winter months
    - 5-15% of adult cases and up to 50% of all pediatric cases of acute pharyngitis
    - most prevalent between 5-17 yr old

Clinical Features
- viral
  - pharyngitis, conjunctivitis, rhinorrhea, hoarseness, cough
  - nonspecific flu-like symptoms such as fever, malaise, and myalgia
  - often mimics bacterial infection
  - common viral infections
    - EBV (infectious mononucleosis)
      - pharyngitis, tonsillar exudate, fever, lymphadenopathy, fatigue, rash
    - coxsackie virus (hand, foot, and mouth disease)
      - primarily late summer, early fall
      - sudden onset of fever, pharyngitis, headache, abdominal pain, and vomiting
      - appearance of small vesicles that rupture and ulcerate on soft palate, tonsils, pharynx
      - ulcers are pale grey and several mm in diameter, have surrounding erythema, and may appear on hands and feet
  - coxsackie virus
    - like coxsackie virus but ulcers are fewer and larger
    - pharyngitis, tonsillar exudate, fever, lymphadenopathy, fatigue, rash
- bacterial
  - symptoms: pharyngitis, fever, malaise, headache, abdominal pain, absence of cough
  - signs: fever, tonsillar or pharyngeal erythema/exudate, swollen/tender anterior cervical nodes, halitosis
  - complications: rheumatic fever, glomerulonephritis, suppurative complications (abscess, sinusitis, otitis media, cervical adenitis, pneumonia), meningitis, impetigo

Red Flags in Patients with “Sore Throat”
- Persistence of symptoms longer than 1 wk without improvement
- Respiratory difficulty (particularly stridor, croup, etc.)
- Difficulty in handling secretions (peritonsillar abscess)
- Difficulty in swallowing (Ludwig’s angina)
- Severe pain in the absence of erythema (supraglottitis/epiglottitis)
- Palpable mass (neoplasm)
- Blood in the pharynx or ear (trauma)
Investigations
- suspected GABHS
  - see Table 29 for approach to diagnosis and management of GABHS
  - gold standard for diagnosis is throat culture
  - rapid test for streptococcal antigen: high specificity (95%) but low sensitivity (50-90%)
  - suspected EBV (infectious mononucleosis)
    - peripheral blood smear, heterophile antibody test (i.e. the latex agglutination assay or "monospot")

Table 29. Modified Centor Score: Approach to Diagnosis and Management of GABHS

<table>
<thead>
<tr>
<th>POINTS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cough absent?</td>
</tr>
<tr>
<td>History of fever &gt;38°C?</td>
</tr>
<tr>
<td>Tonsillar exudate?</td>
</tr>
<tr>
<td>Swollen, tender anterior nodes?</td>
</tr>
<tr>
<td>Age 3-14</td>
</tr>
<tr>
<td>Age 15-44</td>
</tr>
<tr>
<td>Age &gt;45</td>
</tr>
</tbody>
</table>

In communities with moderate levels of strep infection (10-20% of sore throats):

<table>
<thead>
<tr>
<th>Score</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4 or more</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chance patient has strep</td>
<td>1-2.5%</td>
<td>5-10%</td>
<td>11-17%</td>
<td>28-35%</td>
<td>51-53%</td>
</tr>
<tr>
<td>Suggested action</td>
<td>NO culture or antibiotic</td>
<td>Culture all, treat with antibiotics only if culture is positive</td>
<td>Culture all, treat with antibiotics on clinical grounds¹, discontinue antibiotics if culture comes back negative</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

¹Clinical grounds include a high fever or other indicators that the patient is clinically unwell and is presenting early in the course of the illness
²If an outbreak or epidemic of illness caused by GABHS is occurring in any community, the score is invalid and should not be used

Management
- viral pharyngitis
  - antibiotics not indicated
  - symptomatic therapy: acetaminophen/NSAIDs for fever and muscle aches, decongestants
- GABHS
  - antibiotic treatment decreases severity and duration of symptoms, risk of transmission (after 24 h of treatment), and risk of rheumatic fever and suppurative complications
  - incidence of glomerulonephritis is not decreased with antibiotic treatment
  - no increased incidence of rheumatic fever with 48 h delay in antibiotic treatment; if possible, delay antibiotic treatment until culture confirms diagnosis
  - routine F/U and/or post-treatment throat cultures are not required for most patients
  - F/U throat culture only recommended for: patients with history of rheumatic fever, patients of family member(s) with history of acute rheumatic fever, suspected streptococcal carrier
- infectious mononucleosis (EBV)
  - self-limiting course; antibiotics are not indicated
  - symptomatic treatment: acetaminophen/NSAIDs for fever, pharyngitis, malaise
  - avoid heavy physical activity and contact sports for at least one month or until splenomegaly resolves because of risk of splenic rupture
  - if acute airway obstruction, give corticosteroids and consult ENT
Complementary and Alternative Medicine

Epidemiology
- 50-75% of Canadians report some use of CAM over their lifetime, and only half will disclose this use to their physician
- use is highest in Western provinces and lowest in Atlantic provinces
- more likely to be used by younger patients and those with higher education and income
- examples: chiropractic, acupuncture, massage, naturopathy, homeopathy, traditional Chinese medicine, craniosacral therapy, osteopathy

Herbal Products
- over 50% of Canadians use natural health products (NHPs)
- most commonly used include echinacea, ginseng, ginkgo, garlic, St. John's wort, and soy
- relatively few herbal products have been shown to be effective in clinical trials
- many patients believe herbal products are inherently safe and are unaware of potential side effects and interactions with conventional medicines
- all NHPs must be regulated under The Natural Health Products Regulations as of January 1, 2004, including herbal remedies, homeopathic medicines, vitamins, minerals, traditional medicines, probiotics, amino acids, and essential fatty acids (e.g. omega-3)
- always ask patients whether they are taking any herbal product, herbal supplement, or other natural remedy. Further questions may include:
  ▪ Are you taking any prescription or non-prescription medications for the same purpose as the herbal product?
  ▪ Are you allergic to any plant products?
  ▪ Are you pregnant or breastfeeding?
- information resources: National Center for CAM (www.nccam.nih.gov), Health Canada website

Overview of Gastrointestinal Tract

- the gastrointestinal tract runs from mouth to anus ("gum to bum")

<table>
<thead>
<tr>
<th>Organ</th>
<th>Function</th>
<th>Blood Supply</th>
<th>Innervation</th>
<th>Histology and Structural Features</th>
</tr>
</thead>
<tbody>
<tr>
<td>Esophagus</td>
<td>• Muscular tube approximately 25 cm long with a diameter of 2 cm</td>
<td>• Arterial: left gastric artery and left inferior phrenic artery</td>
<td>• Parasympathetic innervation via anterior and posterior gastric nerves (vagal trunks)</td>
<td>• Mucosa: stratified squamous epithelium</td>
</tr>
<tr>
<td></td>
<td>• Extends from pharynx to the stomach</td>
<td>• Venous: Left gastric vein → portal venous system</td>
<td>• Sympathetic innervation via thoracic trunks of the greater splanchnic nerves</td>
<td>• Submucosa: connective tissue, lymphocytes, plasma cells, nerve cells</td>
</tr>
<tr>
<td>Stomach</td>
<td>• Delivers food to intestine for digestion and absorption</td>
<td>• Esophageal veins → ayguses vein → IVC (systemic)</td>
<td>• Parasympathetic innervation via vagus nerve</td>
<td>• Muscularis propria (muscularis externa); inner circular, outer longitudinal muscle</td>
</tr>
<tr>
<td></td>
<td>• Secretes acid, probably to reduce enteric infections/pneumonia; facilitate digestion of protein/iron/B₁₂</td>
<td></td>
<td>• Sympathetic innervation via celiac plexus (from T6-T9)</td>
<td>• Upper 1/3: striated muscle</td>
</tr>
<tr>
<td></td>
<td>• Secretes intrinsic factor to facilitate B₁₂ absorption</td>
<td></td>
<td>• Greater curvature</td>
<td>• Middle 1/2: transition zone</td>
</tr>
<tr>
<td></td>
<td>• Minor contribution to initial protein digestion via pepsin</td>
<td></td>
<td>• Right and left gastro-omental (gastroepiploic) arteries (from gastroduodenal and splenic arteries respectively)</td>
<td>• Lower 1/3: smooth muscle</td>
</tr>
<tr>
<td>Duodenum</td>
<td>• Modulates enteral pH via secretin → decreased gastric acid secretion, increased bicarbonate secretion</td>
<td>• Lesser curvature</td>
<td>• Parasympathetic innervation via vagus nerve</td>
<td>5 parts</td>
</tr>
<tr>
<td></td>
<td>• Secretes CCK to stimulate bile secretion</td>
<td>• Right and left gastric arteries (from celiac trunk)</td>
<td>• Sympathetic innervation via celiac plexus</td>
<td>• Cardia</td>
</tr>
<tr>
<td></td>
<td>• Site of iron absorption</td>
<td>• Greater curvature</td>
<td>• Fundus: short and posterior gastric arteries (from the splenic artery)</td>
<td>• Fundus</td>
</tr>
<tr>
<td></td>

<td>Histology and Structural Features</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------------------------------------------------------------------</td>
<td>----------------------------------------</td>
<td>--------------------------------------------------</td>
<td>-----------------------------------</td>
</tr>
<tr>
<td>Jejunum</td>
<td>Absorption of sodium, water, and nutrients (protein, carbohydrates, fat, folic acid, and vitamin A, B, C, D, E, K)</td>
<td>Superior mesenteric artery</td>
<td>Parasympathetic innervation via fibers of the posterior vagal trunk</td>
<td>Deep red colour, 2-4 cm in thickness, thick and heavy wall, Plicae circulares are large, tall, and closely packed, Has long vasa recta, Scant fat in mesentery, Scant Peyers patches</td>
</tr>
<tr>
<td>Ileum</td>
<td>Absorption of sodium, water, nutrients, soluble vitamins (only site of vitamin B₁₂ absorption), and bile salts (entero-hepatic circulation)</td>
<td>Superior mesenteric artery</td>
<td>Same as jejunum</td>
<td>When compared to jejunum: Paler pink colour, 2-3 cm in thickness, Thin and light walls, Plicae circulares are small and sparse, Contains more mesenteric fat, Many Peyers patches</td>
</tr>
<tr>
<td>Large Bowel</td>
<td>Absorption of water (5-10% of total water), Bacteria: further digestion of chyme and metabolism of undigested CHO to short chain fatty acids, Formation and storage of feces</td>
<td>Branches of superior and inferior mesenteric arteries, Rectal blood supply: sigmoid, right pudendal, and rectal arteries</td>
<td>Parasympathetic innervation via vagus nerve, Sympathetic innervation via greater and lesser splanchnic nerves</td>
<td>Consists of cecum, colon (ascending, transverse, descending, and sigmoid), rectum and anal canal, Features include teniae coli, hastra, and omental appendices</td>
</tr>
<tr>
<td>Liver</td>
<td>Glucose homeostasis, Plasma protein synthesis, Lipid and lipoprotein synthesis, Bile acid synthesis and secretion, Vitamin A, D, E, K, B₁₂ storage, Biotransformation, detoxification, Excretion of compounds</td>
<td>2 sources, Portal vein (75-80%), Hepatic artery (20-25%)</td>
<td>Sympathetic innervation via fibers of the celiac plexus, Parasympathetic innervation via fibers of the anterior and posterior vagal trunks</td>
<td>Largest internal organ, Consisted of 4 lobes (left, right, caudate, quadrate), and divided into 8 segments</td>
</tr>
<tr>
<td>Biliary Tract</td>
<td>Gallbladder functions to store and release bile that is produced in the liver, Bile is used to emulsify fat and is composed of cholesterol, lecithin, bile acids, and bilirubin, CCK stimulates gallbladder emptying while trypsin and chymotrypsin inhibit bile release</td>
<td>Cystic artery</td>
<td>Parasympathetic innervation via vagus nerve, Sympathetic and visceral innervation via celiac nerve plexus, Somatic afferent fibers via right phrenic nerve</td>
<td>Consists of the hepatic ducts (intrahepatic, left, right, and common), gallbladder, cystic duct, common bile duct, and ampulla of Vater</td>
</tr>
<tr>
<td>Pancreas</td>
<td>Endocrine function: islets of Langerhans produce glucagon, insulin, and somatostatin (from the α, β, and δ cells, respectively), Exocrine function: digestive enzymes are produced including amylase, lipase, trypsin, chymotrypsin, and carboxypeptidase</td>
<td>Anterior superior pancreaticoduodenal artery (from the celiac trunk), Anterior inferior pancreaticoduodenal artery (from the superior mesenteric artery), Dorsal pancreatic artery (from the splenic artery), Pancreatic veins drain into the portal, splenic, and superior mesenteric veins</td>
<td>Parasympathetic innervation via vagus nerve, Sympathetic innervation via abdominopelvic splanchnic nerves</td>
<td>4 parts of pancreas: head (includes uncinate process), neck, body, and tail, (Major) pancreatic duct connecting to common bile duct prior to ampulla of Vater, Accessory pancreatic duct connected directly to duodenum</td>
</tr>
</tbody>
</table>

### Visualizing the GI Tract

- see Medical Imaging, MI10

### Esophagus, Stomach, Duodenum

- **OGD**: best visualization of mucosa; also allows for therapeutic intervention (e.g. banding varices, thermal therapy/clipping/injecting bleeding ulcers, and dilatation e.g. treatment of esophageal strictures)
- consider barium swallow first if dysphagia, decreased level of consciousness (increases risk of aspiration), inability to cooperate (increases risk of pharyngeal trauma during intubation), possibility of fistulas
- endotracheal intubation first if massive upper GI bleed, acidemia, or inability to protect airway
Small Bowel
- most difficult to visualize, especially if mucosal detail is needed
- CT enterography more accurate than small bowel follow through, but both have low sensitivity
- MRI small bowel imaging increasingly available, especially useful if radiation exposure is an issue (e.g. young patient, multiple radiological images already done)
  - note: MRI enteroclysis: luminal contrast administered by nasojejunal tube to dilate the small bowel - disliked by both radiologist and patient, but may improve sensitivity
- "double balloon" enteroscopy (enteroscope with proximal and distal balloons to propel endoscope into jejunum from mouth or into jejunum/ileum or into ileus from anus) may be most sensitive but currently available only in selected centres; technically demanding
- wireless endoscopy capsule (26 x 11 mm capsule is swallowed, transmits images to a computer; contraindicated in bowel obstruction) is also accurate in diagnosis but unable to provide any therapeutic intervention

Colon and Terminal Ileum
- colonscopy, with biopsy if required; contraindicated in perforation, acute diverticulitis, and severe colitis (increased risk of perforation)
- CT colonography ("virtual colonoscopy") more accurate in diagnosing diverticulosis, extrinsic pressure on colon (e.g. ovarian cancer compressing sigmoid colon), and fistulae; increasing evidence for use in colorectal cancer screening, especially for assessment of right side of colon in cases where colonscopy is less sensitive

Pancreatic/Biliary Duct
- MRCP almost as sensitive as ERCP in determining if bile duct obstruction present, but less accurate in determining cause of obstruction (tumour, stone, stricture)
- ERCP if endoscopic draining necessary, strong suspicion of stone, obstruction requiring stenting, or if tissue sampling required

Differential Diagnosis of Common Presenting Complaints

See General Surgery, Acute Abdominal Pain, GS4

## Esophagus

### Gastroesophageal Reflux Disease

**Definition**
- condition in which the stomach contents (most characteristically acid) moves backwards from the stomach into the esophagus (the tube from the mouth to the stomach)

**Etiology**
- inappropriate transient relaxations of LES – most common cause
- low basal LES tone (especially in scleroderma)
- contributing factors include: delayed esophageal clearance, delayed gastric emptying, obesity, pregnancy, acid hypersecretion (rare) from Zollinger-Ellison syndrome (gastrin-secreting tumour)
- hiatus hernia worsens reflux, does not cause it (see General Surgery, GS13)

**Clinical Features**
- “heartburn” (pyrosis) and acid regurgitation (together are 80% sensitive and specific for reflux)
- ± sour regurgitation, water brash, sensation of a lump in the throat (globus sensation), and frequent belching
- non-esophageal symptoms (see G7) are increasingly recognized of being poor predictors of reflux

**Foods/Substances that Aggravate GERD Symptoms**
- EtOH
- Caffeine
- Tobacco
- Fatty/fried foods
- Chocolate
- Peppermint
- Spicy foods
- Citrus fruit juices

**GERD signs/symptoms**

- **Respiratory**
  - Chronic cough
  - Wheezing
  - Aspiration pneumonia

- **Non-respiratory**
  - Sore throat
  - Hoarseness
  - Dental erosions

- **Typical**
  - Heartburn
  - Acid regurgitation

- **Atypical**
  - Chest pain
  - Dysphagia (late)
  - Odynophagia (rare)

**Dyspepsia** = postprandial fullness, early satiety, epigastric pain, or burning

---

*Figure 2. Signs and symptoms of GERD*
Investigations

- usually, a clinical diagnosis is sufficient based on symptom history and relief following a trial of pharmacotherapy (PPI: symptom relief 80% sensitive for reflux)
- gastroscopy indications (*Ann Intern Med* 2012;157:808-816)
  - absolute indications
    - heartburn accompanied by red-flags (bleeding, weight loss, etc.)
    - persistent reflux symptoms or prior severe erosive esophagitis after therapeutic trial of 4-8 wk of PPI 2x daily
    - history of esophageal stricture with persistent dysphagia
    - repeat endoscopy after 6-8 wk of PPI therapy is indicated if: 1) severe esophagitis (because it can mask Barrett’s esophagus) or 2) known Barrett’s esophagus or 3) recurrence of symptoms
- esophageal manometry (study of esophageal motility)
  - may be done to diagnose abnormal peristalsis and/or decreased LES tone, but cannot detect presence of reflux; indicated before surgical fundoplication to ensure intact esophageal function
- surgical fundoplication (wrapping of gastric fundus around the lower end of the esophagus)
  - more likely to alleviate symptoms if lower esophageal pressure is diminished; less likely to be successful if abnormal peristalsis
- 24 h pH monitoring; most accurate test for reflux, but not required or performed in most cases
- most useful if PPIs do not improve symptoms

Treatment

- PPIs are the most effective therapy and usually need to be continued as maintenance therapy
- on-demand: antacids (Mg(OH)2, Al(OH)3, alginate), H2-blockers, or PPIs can be used for NERD
- diet helps symptoms, not the disease; avoid alcohol, coffee, spices, tomatoes, and citrus juices
- only beneficial lifestyle changes are weight loss (if obese) and elevating the head of bed (if nocturnal symptoms)
- symptoms may recur if therapy is discontinued

Complications

- esophageal stricture disease – scarring can lead to dysphagia (solids)
- ulcer
- bleeding
- Barrett’s esophagus and esophageal adenocarcinoma – gastroscopy is recommended for patients with chronic GERD or symptoms suggestive of complicated disease (e.g. anorexia, weight loss, bleeding, dysphagia)

Barrett’s Esophagus

Definition

- metaplasia of normal squamous esophageal epithelium to abnormal columnar epithelium containing-type intestinal mucosa (intestinal metaplasia)

Etiology

- thought to be acquired via long-standing GERD and consequent damage to squamous epithelium

Epidemiology

- in North America and Western Europe, 0.5-2.0% of adults are thought to have Barrett’s esophagus
- up to 10% of GERD patients will have already developed BE by the time they seek medical attention
- more common in males, age >50, Caucasians, smokers, overweight, hiatus hernia, and long history of reflux symptoms

Pathophysiology

- endoscopy shows erythematous epithelium in distal esophagus; diagnosis of BE relies on biopsy demonstrating the presence of specialized intestinal epithelium of any length within the esophagus
- BE predisposes first to premalignant changes characterized as low or high-grade dysplasia, which then progresses to adenocarcinoma

Gastroesophageal Reflux Disease

- Gastroscopy
  - Non-erosive reflux disease (NERD)
    - Aim for symptom relief only; proton pump inhibitor PRN
  - Esophagitis
    - Esophageal inflammation
      - Aim to heal inflammation; proton pump inhibitor indefinitely or surgical fundoplication

Esophageal damage from reflux is most severe at first gastroscopy, therefore gastroscopy is necessary only once for patients with NERD

Up to 25% of patients with Barrett’s esophagus do not report symptoms of GERD

Impact of Endoscopic Surveillance on Mortality from Barrett’s Esophagus - Associated Esophageal Adenocarcinomas

*Gastroenterology* 2013;145:312-319

There is no question that Barrett’s esophagus (BE) increases the incidence of esophageal adenocarcinoma, which can be recognized early on with a safe procedure, endoscopy. Indeed, because early cancer is often asymptomatic and curable, most clinicians recommend period upper endoscopy. Yet Corley et al. found no difference in endoscopy rates in BE patients who died of esophageal adenocarcinomas compared to BE patients who died of other diseases. Perhaps this result is due to statistics, but as the accompanying editorial emphasizes (*Gastroenterology* 2013; 145:273-8) at the very least this finding should question the value of a screening program. In fact, there are multiple other lines of evidence indicating that endoscopic surveillance is of marginal benefit at most. Possible explanations for this disappointing finding include: most esophageal adenocarcinomas may not arise from BE, esophageal carcinoma is too rare a cause of death in BE, morbidity from esophageal cancer treatments, or that endoscopic screening is just not that effective in the real world. The situation is analogous to the disappointing value of serum PSA screening for prostate cancer. Therefore, adoption of screening programs require more than theoretical calculations.
**Significance**
- Rate of malignant transformation is approximately 0.12% per yr for all BE patients prior to dysplasia.
- Risk of malignant transformation in high-grade dysplasia is significantly higher; studies have reported a 32-59% transformation rate over 5-8 yr of surveillance.
- Increased gastric acid secretion is more frequently associated with Barrett's esophagus as opposed to reflux alone.

**Treatment**
- Acid suppressive therapy with high-dose PPI indefinitely (or surgical fundoplication).
- Endoscopy every 3 yr if no dysplasia.
- High grade dysplasia: regular and frequent surveillance with intensive biopsy, endoscopic ablation/resection, or esophagectomy produce similar outcomes; however, evidence increasingly favouring endoscopic ablation with mucosal resection or radiofrequency ablation.
- If low grade dysplasia, both surveillance and endoscopic ablation/resection are satisfactory options.

---

**Dysphagia**

**Definition**
- Difficulty swallowing, globus sensation.

---

**Esophageal Motor Disorders**

**Symptoms**
- Dysphagia with solids and liquids.
- Chest pain (in some disorders).

**Diagnosis**
- Motility study (esophageal manometry).
- Barium swallow sometimes helpful.

**Causes** (see Table 3)
- Idiopathic.
- Achalasia (painless).
- Scleroderma (painless).
- DM.
- DES: rare and can be difficult to diagnose due to intermittent presentation.

Esophageal Diverticula

Definition
- outpouchings of one or more layers of the esophageal tract

Clinical Features
- commonly associated with motility disorders
- dysphagia, regurgitation, retrosternal pain, intermittent vomiting, may be asymptomatic

Classification
- classified according to location
  - pharyngoesophageal (Zenker’s) diverticulum
    - most frequent form of esophageal diverticulum
    - posterior pharyngeal outpouching most often on the left side, above cricopharyngeal muscle and below the inferior pharyngeal constrictor muscle
    - symptoms: dysphagia, regurgitation of undigested food, halitosis
    - treatment: endoscopic or surgical myotomy of cricopharyngeal muscle ± surgical excision of sac
  - mid-esophageal diverticulum
    - secondary to mediastinal inflammation (“traction” diverticulae), motor disorders
    - usually asymptomatic; no treatment required
  - just proximal to LES (pulsatile type)
    - usually associated with motor disorders
    - usually asymptomatic; no treatment required

Peptic Stricture (from Esophagitis)
- presents as dysphagia alongside a long history of reflux symptoms, but reflux symptoms may disappear as stricture develops
- diagnosed with endoscopy or barium study if endoscopy contraindicated or unavailable

Treatment
- endoscopic dilatation and indefinite PPI
- anti-reflux surgery (fundoplication) if above treatment unsuccessful
Esophageal Carcinoma

- see General Surgery, GS15

Webs and Rings

- web = partial occlusion (upper esophagus)
- ring = circumferential narrowing (lower esophagus)

Clinical Features
- asymptomatic with lumen diameter >12 mm, provided peristalsis is normal
- dysphagia with large food boluses
- Schatzki ring
  - mucosal ring at squamo-columnar junction above a hiatus hernia
  - causes intermittent dysphagia with solids
  - treatment involves disrupting ring with endoscopic bougie

Infectious Esophagitis

Definition
- severe mucosal inflammation and ulceration as a result of a viral or a fungal infection

Risk Factors
- DM
- chemotherapeutic agents
- immunocompromised states

Symptoms
- characteristically odynophagia, less often dysphagia
- diagnosis is via endoscopic visualization and biopsy

Appearance
- Candida (most common): whitish-yellow plaques without visible ulceration or inflammation
- Herpes (second most common), CMV: focal ulcers

Treatment
- Candida: nystatin swish and swallow, ketoconazole, fluconazole
- Herpes: often self-limiting; acyclovir, valacyclovir, famciclovir
- CMV: IV gancyclovir, foscarnet, or oral valganciclovir

Stomach and Duodenum

Dyspepsia

Definition
- group of symptoms characterized by discomfort, location in the upper epigastrium, usually following meals; most characteristic symptom is fullness, but can also be a burning, true pain
- multiple causes: esophagitis, peptic ulcer, stomach cancer, drugs, but overall functional disease is most common

History and Physical Exam
- history: most important are age, associated symptoms (such as weight loss and vomiting), and drugs (especially NSAIDs)
- physical exam: adenopathy, abdominal mass/organomegaly, Carnett’s sign (if pain is due to abdominal wall muscle problem then the pain will increase during muscle contraction, such as during a sit-up)

Investigations
- laboratory: usual (CBC, liver enzymes, glucose, Cr, etc.), amylase, albumin, calcium, protein electrophoresis, TSH, Helicobacter serology
- consider trial of empiric anti-secretory drug therapy, non-invasive testing for H. pylori infection, endoscopy, barium radiography (rarely done nowadays)
Stomach

- primary function is mechanical grinding of food facilitating early enzymatic digestion into chyme and propulsion into duodenum (motor function), but also releases secretions

Gastritis

**Definition**
- defined histologically: inflammation of the stomach mucosa

**Etiology**
- some causative agents may play a role in more than one type of gastritis and an individual patient may have histopathological evidence of more than one type of gastritis

<table>
<thead>

</tr>
<tr>
<td>Other infectious gastritides</td>
</tr>
</tbody>
</table>

*Most common causes
Clinical Features
- non-erosive gastritis is asymptomatic (except in certain rare causes like Crohn's disease); difficult to diagnose clinically or endoscopically – requires biopsy for diagnosis
- erosive gastritis can cause bleeding (pain only if progresses to ulcers – rare); can be seen endoscopically

Treatment
- determined by etiology (see H. pylori, G13, NSAID, G14 and Stress-Induced Ulceration, G14)
- non-pharmacological: avoidance of mucosal irritants such as alcohol, NSAIDs, and foods that trigger symptoms

Peptic Ulcer Disease

Definition
- focal defects in the mucosa that penetrate the muscularis mucosal layer results in scarring (defects superficial to the muscularis mucosa have erosions and no scarring)
- peptic ulcer disease includes defects located in the stomach (gastric ulcers) and duodenum (duodenal ulcers)

Etiology

Table 6. Etiology of Peptic Ulcer Disease

<tr>
<td>Idiopathic</td>
<td>15%</td>
<td>10%</td>
</tr>
</tbody>
</table>

- NSAID negative, H. pylori negative ulcers becoming more commonly recognized
- others: CMV, ischemic, idiopathic
- alcohol: damages gastric mucosa but rarely causes ulcers
- peptic ulcer associated with tobacco, cirrhosis of liver, COPD, and chronic renal failure

Clinical Features
- dyspepsia: most common presenting symptom
  - only 5% of patients with dyspepsia have ulcers, while most have functional disease
- may present with complications
  - bleeding 10% (severe if from gastroduodenal artery)
  - perforation 2% (usually anterior ulcers)
  - gastric outlet obstruction 2%
  - penetration (posterior) 2%; may also cause pancreatitis
- duodenal ulcers: 6 classical features, but history alone cannot distinguish from functional dyspepsia
  - epigastric pain; may localize to tip of xiphoid
  - burning
  - develops 1-3 h after meals
  - relieved by eating and antacids
  - interrupts sleep
  - periodicity (tends to occur in clusters over wk with subsequent periods of remission)
- gastric ulcers: more atypical symptoms; a biopsy is necessary to exclude malignancy

Investigations
- endoscopy (most accurate)
- upper GI series
- H. pylori tests (see Table 7)
- fasting serum gastrin measurement if Zollinger-Ellison (ZE) syndrome suspected

Treatment
- specific management depends on etiology; (see H. pylori, G13, NSAID-Induced Ulceration, G14 and Stress-Induced Ulceration, G14)
- eradicate H. pylori if present; chief advantage of triple therapy over PPI is to lower ulcer recurrence rate
- stop NSAIDs if possible
- start PPI: inhibits parietal cell H+/K⁺-ATPase pump which secretes acid
  - heals most ulcers, even if NSAIDs are continued
- other medications (e.g. histamine H₂-antagonists) less effective
- discontinue tobacco
- no diet modifications required but some people have fewer symptoms if they avoid caffeine, alcohol, and spices

Gastric vs. Duodenal Ulcers
Gastric ulcers must always be biopsied to rule out malignancies; duodenal ulcers are rarely malignant
Management of Bleeding Peptic Ulcers
- OGD to explore upper GI tract
- IV pantoprazole continuous drip
- establish risk of rebleeding/continuous bleed (since most ulcers stop bleeding spontaneously)
  - clinical risk factors: increased age (>60), bleeding diathesis, history of PUD, comorbid disease, hemodynamically unstable
  - endoscopic signs of recurrent bleeding (active bleeding, visible vessel, clot, red spot) more predictive than clinical risk factors
  - if high risk, consider ICU admission

Figure 6. Approach to management of suspected bleeding peptic ulcer
Adapted from: Gralnek I, Barkun A, Bardou M. Management of acute bleeding from a peptic ulcer. NEJM 2008;359:928-937

H. pylori-Induced Peptic Ulceration

Pathophysiology
- H. pylori: Gram-negative flagellated rod that resides on but does not invade the gastric mucosa
- acid secreted by parietal cells (stimulated by vagal acetylcholine, gastrin, histamine) necessary for most ulcers
- acid secreted by parietal cells (stimulated by vagal acetylcholine, gastrin, histamine) necessary for most ulcers
- theories of how H. pylori causes ulcers: none satisfactory, but pattern of colonization correlates with outcome
  - gastritis only in antrum (15% of patients), high gastric acid, associated with duodenal ulcer, may progress to gastric metaplasia of duodenum where ulcer forms
  - gastritis throughout stomach (“pangastritis” – 85% of patients), low gastric acid, associated with stomach ulcer and cancer

Epidemiology
- H. pylori is found in about 20% of all Canadians
  - highest prevalence in those raised during 1930s
  - infection most commonly acquired in childhood, presumably by fecal-oral route
  - high prevalence in developing countries, low socioeconomic status (poor sanitation and overcrowding)

Outcome
- gastritis (non-erosive) in 100% of patients but asymptomatic
- peptic ulcer in 15% of patients
- gastric malignancy (gastric carcinoma and mucosal associated lymphomatous tissue [MALT] lymphoma in 0.5% of patients)
- most are asymptomatic but still worthwhile eradicating to lower future risk of peptic ulcer/ gastric malignancy and prevent spread to others (mostly children <5 yr of age)
Diagnosis

Treatment: *H. pylori* Eradication

- **triple therapy for 7-14 d (Hp-Pac™):** PPI bid (e.g. lansoprazole 30 mg bid) + amoxicillin 1 g bid + clarithromycin 500 mg bid
  - 80% success rate
- **quadruple therapy for 10-14 d:** PPI bid + bismuth 525 mg qid + tetracycline 500 mg qid + metronidazole 250 mg qid
  - only recommended as first line therapy if resistance to clarithromycin or metronidazole is high, or in patients with recent or repeated exposure to these drugs
  - levofloxacin can replace metronidazole or tetracycline
- **sequential therapy**
  - days 1-5: PPI bid + amoxicillin 1 g bid
  - days 6-10: PPI bid + clarithromycin 500 mg bid + tinidazole (generally substitute with metronidazole as tinidazole not available in Canada) 500 mg bid
  - 5-15% of cases are resistant to all known therapies

### NSAID-Induced Ulceration

- NSAID use causes gastric mucosal petechiae in virtually all, erosions in most, ulcers in some (25%)
  - erosions bleed, but usually only ulcers cause significant clinical problems
- most NSAID ulcers are clinically silent: dyspepsia is as common in patients with ulcers as in patients without ulcers; NSAID-induced ulcers characteristically present with complications (bleeding, perforation, obstruction)
- NSAIDs more commonly cause gastric ulcers than duodenal ulcers
- may exacerbate underlying duodenal ulcer disease

Pathophysiology

- direct: erosions/petechiae – are due to local (direct) effect of drug on gastric mucosa
- indirect: systemic NSAID effect (intravenous NSAID causes ulcers, but not erosions), inhibits mucosal cyclooxygenase, leading to decreased synthesis of protective prostaglandins, thus leading to ulcers

### Risk Factors For NSAID Causing Peptic Ulcer

- previous peptic ulcers/UGIB
- age
- high dose of NSAID/multiple NSAIDs being taken
- concomitant corticosteroid use
- concomitant cardiovascular disease/other significant diseases

Treatment

- prophylactic cytoprotective therapy with a PPI is recommended if any of the above risk factors exist concomitantly with ASA/NSAID use
- lower NSAID dose or stop all together and replace with acetaminophen
- combine NSAID with PPI or misoprostol in one tablet
- enteric coating of Aspirin* (ECASA) provides minor benefit since this decreases incidence of erosion, not incidence of ulceration

### Stress-Induced Ulceration

Definition

- ulceration or erosion in the upper GI tract of ill patients, usually in ICU
- lesions most commonly in fundus of stomach

Pathophysiology

- unclear: likely involves ischemia; may be caused by CNS disease, acid hypersecretion, Cushing ulcers
- physiological stress (e.g. fever, severe illness, complex post-operative course) causes ulcers and erosions

If at high risk for development of ulcers, prophylaxis with PPI indicated
Gastroenterology Stomach and Duodenum/Small and Large Bowel

Toronto Notes 2016

Risk Factors
- mechanical ventilation
- anti-coagulation
- multi-organ failure
- sepsis
- severe surgery/trauma
- CNS injury ("Cushing's ulcers")
- burns involving more than 35% of body surface

Clinical Features
- UGIB (see Upper Gastrointestinal Bleeding, G25)
- painless

Treatment
- prophylaxis with gastric acid suppressants (H2-blockers or PPI) decreases risk of UGIB, but may increase risk of pneumonia
- treatment same as for bleeding peptic ulcer but often less successful

Gastric Carcinoma
- see General Surgery, GS19

Small and Large Bowel

Classification of Diarrhea

Definition
- clinically: diarrhea defined as stools that are looser and/or more frequent than normal; physiologically: 24 h stool weight >200 g (less useful clinically)

Classification
- acute vs. chronic
- small volume (tablespoons of stool; typical of colonic diseases) vs. large volume (>1/2 cup stool; typical of small bowel diseases)
- watery vs. steatorrhea
- secretory (diarrhea persists with fasting) vs. osmotic (diarrhea stops with fasting)

Acute Diarrhea

Definition
- passage of frequent unformed stools for <14 d

Etiology
- most commonly due to infections
- most infections are self-limiting and resolve within 7 d

Risk Factors
- food (seafood, chicken, turkey, eggs, beef)
- medications: antibiotics, laxatives
- others: high risk sexual activity, infectious outbreaks, family history (IBD)

Table 8. Classification of Acute Diarrhea

</table>

Infectious Causes of Inflammatory Diarrhea
- Yersinia
- Shigella
- Salmonella
- E. coli (EHEC O157:H7), E. histolytica
- Campylobacter, C. difficile

Useful Questions in Acute Diarrhea
- Those Fads Wilt
  - Travel
  - Homosexual contacts
  - Outbreaks
  - Seafood
  - Extra-intestinal signs of IBD
  - Family history
  - Antibiotics
  - Diet
  - Steatorrhea
  - Weight loss
  - Immunosuppressed
  - Laxatives
  - Tumour history

Stool Osmotic Gap
- Stool osmolality is normally about 290 mOsm/kg and can be approximated by the calculated stool osmolality
  \[2 \times [\text{Na}^+]_{\text{stool}} + [\text{K}^+]_{\text{stool}}\]
- In osmotic diarrhea, measured stool osmolality > calculated stool osmolality
- In secretory diarrhea measured stool osmolality = calculated stool osmolality

Curling’s and Cushing’s Ulcers
- Curling’s ulcer: acute peptic ulcer of the duodenum resulting as a complication from severe burns when reduced plasma volume leads to ischemia and cell necrosis (sloughing) of the gastric mucosa (think BURN from a CURLing iron)
- Cushing’s ulcer: peptic ulcer produced by elevated intracranial pressure (may be due to stimulation of vagal nuclei secondary to elevated ICP which leads to increased secretion of gastric acid)
Investigations

- stool cultures/microscopy (C&S/O&P) are required only if diarrhea is inflammatory, severe, or for epidemiological purposes (day care worker, nursing home resident, community outbreaks, e.g. Walkerton, etc.)
  - C&S only tests Campylobacter, Salmonella, Shigella, E. coli
  - other organisms must be ordered separately
- flexible sigmoidoscopy (without bowel preparation): useful if inflammatory diarrhea suspected
  - biopsies are the most useful method of distinguishing idiopathic IBD (Crohn's disease and ulcerative colitis) from infectious colitis or acute self-limited colitis
- C. difficile toxin: indicated when recent/remote antibiotic use, hospitalization, nursing home, or recent chemotherapy

Treatment

- fluid and electrolyte replacement orally in most cases, intravenous if severe extremes of age/coma
- anti-diarrheals
  - antimitoty agents: diphenoxylate, loperamide (Imodium®); contraindicated in mucosal inflammation
    - side effects: abdominal cramps, toxic megacolon
  - absorbants: kaolin/pectin (Kaopectate®), methylcellulose, activated attapulgite
    - act by absorbing intestinal toxins/micro-organisms, or by coating intestinal mucosa
    - much less effective than antimitoty agents
  - modifiers of fluid transport: bismuth subsalicylate (Pepto-Bismol®) may be helpful (but should not be used in the presence of bloody diarrhea or fever)
- antibiotics: rarely indicated
  - risks
    - prolonged excretion of enteric pathogen (especially Salmonella)
    - drug side effects (including C. difficile infection)
    - development of resistant strains
    - renal failure/hemolysis (enterohemorrhagic E. coli O157:H7)
  - indications for antimicrobial agents in acute diarrhea
    - septicemia
    - prolonged fever with fecal blood or leukocytes
  - clearly indicated: Shigella, V. cholerae, C. difficile, traveller's diarrhea (enterotoxigenic E. coli [ETEC]), Giardia, Entamoeba histolytica, Cyclospora
  - situational: Salmonella, Campylobacter, Yersinia, non-enterotoxigenic E. coli
  - Salmonella: always treat Salmonella typhi (typhoid or enteric fever); treat other Salmonella only if there is underlying immunodeficiency, hemolytic anemia, extremes of age, aneurysms, prosthetic valve grafts/joints, sickle cell disease

Chronic Diarrhea

Definition
- passage of frequent unformed stool for >14 d
- approach is similar to that of acute diarrhea except that the majority of cases are non-infectious

Etiology/Classification
- see Differential Diagnosis of Common Presenting Complaints, G4

Investigations

- guided by history
- stool analysis for: C. difficile toxin, C&S, O&P ± fecal fat, WBC
- blood for: CBC, electrolytes, CRP, TSH, celiac serology (IgA anti-tTG; ask for serum protein electrophoresis or immunoglobulin quantitation to rule out IgA deficiency which has an increased frequency in celiac disease)
- colonoscopy and ileoscopy with biopsy
- upper GI endoscopy with duodenal biopsy
- wireless small bowel endoscopy capsule (low yield)
- trial of lactose free diet
  - caveat: may delay diagnosis of IBD and celiac disease

Traveller’s Diarrhea

- see Infectious Diseases, ID13

Finally: A Role for Bacteriotherapy
Duodenal Infusion of Donor Feces for Recurrent Clostridium difficile
NEJM 2013; 368:407-15

For centuries, out-of-the-box thinkers have speculated that the colonic bacteria all of us have, but which differs among individuals, play a role in disease. More recently, the colonic microbiome has become the hottest area of research in gastroenterology. The best documented medical indication for manipulating the colonic bacteria is recurrent C. difficile infection. In this randomized study of this disease, infusion of donor feces via a nasoduodenal tube resolved diarrhea in 81% of patients, without side-effects, compared to 31% given the standard treatment of oral vancomycin, and 23% of patients given oral vancomycin plus bowel lavage. It takes little prescience to predict an onslaught of future studies investigating the therapeutic potential of altering the human microbiome.
Maldigestion and Malabsorption

Definition
- **maldigestion**: inability to break down large molecules in the lumen of the intestine into their component small molecules
- **malabsorption**: inability to transport molecules across the intestinal mucosa into circulation
- **malassimilation**: encompasses both maldigestion and malabsorption

Etiology
- **maldigestion**
  - inadequate mixing of food with enzymes (e.g. post-gastrectomy)
  - pancreatic exocrine deficiency
  - primary diseases of the pancreas (e.g. cystic fibrosis, pancreatitis, cancer)
  - bile salt deficiency
    - terminal ileal disease (impairment recycling), bacterial overgrowth (deconjugation of bile salts), rarely liver disease (cholestatic, e.g. primary biliary cirrhosis)
  - specific enzyme deficiencies (e.g. lactase)
- **malabsorption**
  - inadequate absorptive surface
  - infections/infestations (e.g. Whipple's disease, Giardia)
  - immunologic or allergic injury (e.g. celiac disease)
  - infiltration (e.g. lymphoma, amyloidosis)
  - fibrosis (e.g. systemic sclerosis, radiation enteritis)
  - bowel resection (length, site, location, presence/absence of ileocecal valve are important)
  - extensive ileal Crohn's disease
  - drug-induced
    - cholestyramine, ethanol, neomycin, tetracycline, and other antibiotics
  - endocrine
  - DM (complex pathogenesis)

Clinical Features
- symptoms usually vague unless disease is severe
- weight loss, diarrhea, steatorrhea, weakness, fatigue
- manifestations of malabsorption/deficiency

</tbody>
</table>

Fat Soluble Vitamins: ADEK
- vitamin A, vitamin D, vitamin E, vitamin K

* Calcium malabsorption more commonly causes decreased bone density rather than hypocalcemia because serum calcium levels are protected by leaching calcium from the bone
Investigations
- transglutaminase antibody serology/immunoglobulin quantitation and abdominal imaging are most useful because celiac disease and chronic pancreatitis are the two most common causes of steatorrhea
- 72 h stool collection (weight, fat content) documents steatorrhea (gold standard)
- fecal elastase (not routinely available) to screen for pancreatic insufficiency and/or consider empiric trial of pancreatic enzymes based on clinical context
- serum carotene (precursor to vitamin A), folate, Ca\(^{2+}\), Mg\(^{2+}\), vitamin B\(_{12}\), albumin, ferritin, serum iron solution, INR/PTT
- stool fat globules on fecal smear stained with Sudan (rarely used)
- other tests specific for etiology (e.g. CT scan/MRI to visualize pancreas)

Treatment
- dependent on underlying etiology

Celiac Disease (Gluten Enteropathy/Sprue)

Definition
- abnormal small intestine mucosa due to intestinal reaction to gliadin, a component of gluten found in cereal grains

Etiology
- only autoimmune disease in which antigen (a peptide in α-gliadin) is recognized
- associated with other autoimmune diseases, especially Sjögren's, thyroid disease
- gluten, a protein in cereal grains, is broken down to gliadin, which is the toxic factor
- HLA-DQ2 (chromosome 6) found in 80-90% of patients compared with 20% in general population; celiac also associated with HLA-DQ8 (note: up to 40% of Caucasians carry the HLA alleles, but will never develop celiac disease)

Epidemiology
- more common in women
- family history: 10-15% of first-degree relatives
- may present any time from infancy (when cereals introduced) to elderly
- peak presentation in infancy

Clinical Features
- classic presentation: diarrhea, weight loss, anemia, symptoms of vitamin/mineral deficiency, failure to thrive; more common current presentation: bloating, gas, iron deficiency
- improves with gluten-free diet, deteriorates when gluten reintroduced
- disease is usually most severe in proximal bowel
  - thus iron, calcium, and folic acid deficiency (proximal absorption) more common than vitamin B\(_{12}\) deficiency (absorbed in ileum)
- gluten enteropathy may be associated with dermatitis herpetiformis skin eruption, epilepsy, myopathy, depression, paranoia, infertility, bone fractures/metabolic bone disease

Investigations
- small bowel mucosal biopsy (usually duodenum) is diagnostic with
  - increased intraepithelial lymphocytes (earliest pathologic finding)
  - crypt hyperplasia
  - villous atrophy
  - note: villous atrophy also seen in small bowel overgrowth, Crohn's, lymphoma, Giardia, HIV
- consider CT enterography to visualize small bowel to rule out lymphoma
- evidence of malabsorption (localized or generalized)
  - steatorrhea
  - low levels of ferritin/iron saturation, Ca\(^{2+}\), Fe, albumin, cholesterol, carotene, B\(_{12}\) absorption
- improvement with a gluten-free diet; should not be started before anti-tTG and biopsy
- serological tests
  - serum anti-tTG antibody, IgA, is 90-98% sensitive, 94-97% specific
  - IgA deficient patients have false-negative anti-tTG
    - therefore, measure serum IgA concomitantly (via serum quantitative protein electrophoresis)
- fecal fat >7%

Treatment
- dietary counseling
  - gluten free diet; avoid barley, rye, wheat (as these grains are related and also have toxic factor, similar to gliadin)
  - oats allowed if not contaminated by other grains (grown in soil without cross-contamination)
  - rice and corn flour are acceptable
  - iron, folate supplementation (with supplementation of other vitamins as needed)
if poor response to diet change, consider
  • alternate diagnosis
  • non-adherence to gluten-free diet
  • concurrent disease (e.g. microscopic colitis, pancreatic insufficiency)
  • development of intestinal (enteropathy-associated T-cell) lymphoma (abdominal pain,
  weight loss, palpable mass)
  • development of diffuse intestinal ulceration, characterized by aberrant intraepithelial T-cell
  population (precursor to lymphoma)

**Prognosis**
• associated with increased risk of lymphoma, carcinoma (e.g. small bowel and colon; slight
increase compared with general population), autoimmune diseases
• risk of lymphoma may be lowered by dietary gluten restriction

**Inflammatory Bowel Disease**

**Definition**
• Crohn’s disease (CD), ulcerative colitis (UC), indeterminate colitis or IBD-unclassified (IBDU)

**Pathophysiology**
• poorly understood
• sustained response of the immune system, perhaps to enteric flora in a genetically predisposed
individual
• current hypothesis: lack of appropriate down-regulation of immune responsiveness

**Genetics**
• increased risk of both UC and CD in relatives of patients with either disease, especially siblings,
early onset disease
  • familial risk greater if proband has CD rather than UC
• likely polygenomic pattern: 9 gene loci are associated
• CARD15/NOD2 gene mutation associated with CD (relative risk in heterozygote is 3, in
homozygote is 40), especially Ashkenazi Jews, early onset disease, ileal involvement, fistulizing
and stenotic disease
  • CARD15 gene product modulates NFκB, which is required for the innate immune response
to microbial pathogens, best expressed in monocytes-macrophages

### Crohn’s Disease

**Definition**
- chronic transmural inflammatory disorder potentially affecting the entire gut from mouth to perianal region (“gum to bum”)

**Epidemiology**
- incidence 1-6/100,000; prevalence 10-100/100,000
- bimodal: onset before 30 yr, second smaller peak age 60; M=F
- incidence of Crohn’s increasing (relative to UC) especially in young females
- more common in Caucasians, Ashkenazi Jews
  - risk in Asians increases with move to Western countries
- smoking incidence in Crohn’s patients is higher than general population

**Pathology**
- most common location: ileum + ascending colon
- linear ulcers leading to mucosal islands and "cobblestone" appearance
- granulomas are found in 50% of surgical specimens, 15% of mucosal biopsies

**Clinical Features**
- natural history unpredictable; young age, perianal disease, and need for corticosteroids have been associated with poor prognosis, but associations are not strong enough to guide clinical decisions
- most often presents as recurrent episodes of abdominal cramps, diarrhea, and weight loss
- ileitis may present with post-prandial pain, vomiting, RLQ mass; mimics acute appendicitis
- extra-intestinal manifestations are more common with colonic involvement
- fistulae, fissures, abscesses are common
- deep fissures with risk of perforation into contiguous viscera (leads to fistulae and abscesses)
- enteric fistulae may communicate with skin, bladder, vagina, and other parts of bowel

**Investigations**
- colonoscopy with biopsy to visualize (less often gastroscopy)
- CT/MR enterography to visualize small bowel
- CRP elevated in most new cases, useful to monitor treatment response (especially acutely in UC)
- bacterial cultures, O&P, C. difficile toxin to exclude other causes of inflammatory diarrhea
Management (see Figure 7)

Table 12. Management of Crohn’s Disease

<table>
<thead>
<tr>
<th>Management</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lifestyle/Diet</td>
<td>Smoking cessation</td>
</tr>
<tr>
<td></td>
<td>Fluids only during acute exacerbation</td>
</tr>
<tr>
<td></td>
<td>Enteral diets may aid in remission only for Crohn’s ileitis, not colitis</td>
</tr>
<tr>
<td></td>
<td>No evidence for any non-enteral diet changing the natural history of Crohn’s disease, but may affect symptoms</td>
</tr>
<tr>
<td></td>
<td>Those with extensive small bowel involvement or extensive resection require electrolyte, mineral, and vitamin supplements (vit D, Ca²⁺, Mg²⁺, zinc, Fe, B₁₂)</td>
</tr>
<tr>
<td></td>
<td>CAUTION if colitis is severe (risk of precipitating toxic megacolon), therefore avoid during flare-ups</td>
</tr>
<tr>
<td>Antidiarrheal Agents*</td>
<td>Loperamide (Imodium®) &gt; diphenoxylate (Lomotil®) &gt; codeine (cheap but addictive)</td>
</tr>
<tr>
<td></td>
<td>All work by decreasing small bowel motility</td>
</tr>
<tr>
<td></td>
<td>CAUTION if colitis is severe (risk of precipitating toxic megacolon), therefore avoid during flare-ups</td>
</tr>
<tr>
<td>5-ASA</td>
<td>Efficacy controversial: most evidence for mild colonic disease</td>
</tr>
<tr>
<td></td>
<td>Sulfasalazine (Salazopyrin®): 5-ASA bound to sulfapyridine</td>
</tr>
<tr>
<td></td>
<td>Hydrolysis by intestinal bacteria releases 5-ASA (active component)</td>
</tr>
<tr>
<td></td>
<td>Dose-dependent efficacy</td>
</tr>
<tr>
<td></td>
<td>Mesalamine (Pentasa®): coated 5-ASA releases 5-ASA in the ileum and colon</td>
</tr>
<tr>
<td>Antibiotics</td>
<td>e.g. metronidazole (20 mg/kg/d, bid or tid dosing) or ciprofloxacin</td>
</tr>
<tr>
<td></td>
<td>Best described for perianal Crohn’s, although characteristically relapse when discontinued</td>
</tr>
<tr>
<td>Corticosteroids</td>
<td>Prednisone: starting dose 40 mg OD for acute exacerbations; IV methylprednisolone if severe</td>
</tr>
<tr>
<td></td>
<td>No proven role for steroids in maintaining remissions; masks intra-abdominal sepsis</td>
</tr>
<tr>
<td>Immunosuppressives</td>
<td>6-mercaptopurine (6-MP), azathioprine (Imuran®); methotrexate (used less often)</td>
</tr>
<tr>
<td></td>
<td>More often used to maintain remission than to treat active inflammation</td>
</tr>
<tr>
<td></td>
<td>Most commonly used as steroid-sparing agents</td>
</tr>
<tr>
<td></td>
<td>i.e. to lower risk of relapse as corticosteroids are withdrawn</td>
</tr>
<tr>
<td></td>
<td>May require &gt; 3 mo to have beneficial effect; usually continued for several years</td>
</tr>
<tr>
<td></td>
<td>May help to heal fistulae, decrease disease activity</td>
</tr>
<tr>
<td></td>
<td>Side effects: vomiting, pancreatitis, bone marrow suppression, increased risk of malignancy</td>
</tr>
<tr>
<td>Biologics</td>
<td>Infliximab IV (Remicade®) or adalimumab SC (Humira®): both = antibody to TNF-α</td>
</tr>
<tr>
<td></td>
<td>Proven effective for treatment of fistulae and patients with medically refractory CD</td>
</tr>
<tr>
<td></td>
<td>First-line immunosuppressive therapy with infliximab + azathioprine more effective than using either alone</td>
</tr>
<tr>
<td>Surgical/Experimental</td>
<td>Surgical treatment (see General Surgery, GS29)</td>
</tr>
<tr>
<td></td>
<td>Surgery generally reserved for complications such as fistulae, obstruction, abscess, perforation, bleeding, and for medically refractory disease</td>
</tr>
<tr>
<td></td>
<td>If &lt; 50% or &lt; 200 cm of functional small intestine, risk of short bowel syndrome</td>
</tr>
<tr>
<td></td>
<td>At least 50% clinical recurrence within 5 yr; 85% within 15 yr; endoscopic recurrence rate even higher</td>
</tr>
<tr>
<td></td>
<td>40% likelihood of second bowel resection; 30% likelihood of third bowel resection</td>
</tr>
<tr>
<td></td>
<td>Complications of ileal resection</td>
</tr>
<tr>
<td></td>
<td>&lt; 100 cm resected → watery diarrhea or choleraema (impair bile salt absorption)</td>
</tr>
<tr>
<td></td>
<td>Treatment: cholestyramine or anti-diarrheals e.g. loperamide</td>
</tr>
<tr>
<td></td>
<td>&gt; 100 cm resected → steatorrhea (reduced mucosal surface area, bile salt deficiency)</td>
</tr>
<tr>
<td></td>
<td>Treatment: fat restriction, medium chain triglycerides</td>
</tr>
</tbody>
</table>

*Cholestyramine: a bile-salt binding resin; for watery diarrhea with < 100 cm of terminal ileum diseased or resected; however, non-specific anti-diarrheals are more convenient and often more potent

Prognosis
- highly variable course
- 10% disabled by the disease eventually, spontaneous remission also described
- increased mortality, especially with more proximal disease, greatest in the first 4-5 yr
- complications include
  - intestinal obstruction/perforation
  - fistula formation
  - malignancy (lower risk compared to UC)
- surveillance colonoscopy same as ulcerative colitis (see Ulcerative Colitis, G22) if more than 1/3 of colon involved

Traditional Medical Management of Crohn’s

<tr>
<td>Infliximab</td>
<td>+</td>
</tr>
</tbody>
</table>

Note: Starting with immunosuppressives plus immunomodulators (‘bottom-up approach’) increasingly being used (Lancet 2008;371:660-667). Combination of azathioprine and infliximab has the highest remission rate yet described with medical treatment (AJG 2010;82;1383-1395). Characteristically more than 1 yr between onset of symptoms and diagnosis of Crohn’s disease.

Nutrition
- Symptomatic therapy (e.g. loperamide, acetaminophen)
- 5-ASA (mesalamine)
- Antibiotics (Flagyl™, Cipro™)
- Corticosteroids (e.g. budesonide, prednisone)
- Immunosuppression (e.g. azathioprine, 6-MP, methotrexate)
- Immunomodulators (e.g. TNF-antagonists: infliximab, adalimumab)

Experimental therapy or surgery

Figure 7. Traditional graded approach to induction therapy in Crohn’s disease
Ulcerative Colitis

Definition
• inflammatory disease affecting colonic mucosa anywhere from rectum (always involved) to cecum

Epidemiology
• incidence 2-10/100,000; prevalence 35-100/100,000 (more common than Crohn’s)
• 2/3 onset by age 30 (with second peak after 50); M:F
• small hereditary contribution (15% of cases have 1st degree relative with disease)
• risk is less in smokers
• inflammation limited to rectum or left colon is more common than pancolitis

Pathology
• disease can involve any portion of lower bowel ranging from rectum only (proctitis) to entire colon (pancolitis)
• inflammation is diffuse, continuous and confined to mucosa

Clinical Features
• rectal bleeding is the hallmark feature, however diarrhea may be present if more than the rectum is involved
  ▪ can also have abdominal cramps/pain, especially with defecation
• severity of colonic inflammation correlates with symptoms (stool volume, amount of blood in stool)
• tenesmus, urgency, incontinence
• systemic symptoms: fever, anorexia, weight loss, fatigue in severe cases
• extra-intestinal manifestations (see Table 11)
• characteristic exacerbations and remissions; 5% of cases are fulminant

Investigations
• sigmoidoscopy with mucosal biopsy (to exclude self-limited colitis) without bowel prep often sufficient for diagnosis
• colonoscopy helpful to determine extent of disease; contraindicated in severe exacerbation
  ▪ CT colonography (formerly barium enema) if colonoscopy cannot be done; contraindicated in severe disease
• stool culture, microscopy, C. difficile toxin assay necessary to exclude infection
  ▪ no single confirmatory test

Treatment
• mainstays of treatment: 5-ASA (mesalamine) derivatives (only in mild to moderate disease) and corticosteroids, with azathioprine used in steroid-dependent or resistant cases
• diet of little value in decreasing inflammation but may alleviate symptoms
• anti-diarrheal medications generally not indicated in UC
• 5-ASA
  ▪ topical (suppository or enema): very effective for distal disease (distal to splenic flexure), preferable to corticosteroids
  ▪ oral: effective for mild to moderate, but not severe colitis (e.g. sulfasalazine 3-4 g/d, mesalamine 4 g/d)
  ▪ commonly used in maintaining remission (decreases yearly relapse rate from 60% to 15%)
  ▪ may decrease rate of colorectal cancer
• corticosteroids
  ▪ to remit acute disease, especially if severe or first attack; may need maximum dose IV steroids initially (e.g. methylprednisolone 30 mg IV q12h)
  ▪ limited role as maintenance therapy for mild to moderate disease
  ▪ use suppositories for proctitis, enemas for proctosigmoiditis
  ▪ topical steroids (e.g. hydrocortisone foam, budesonide enemas) for inflammation distal to splenic flexure
• immunosuppressants (steroid-sparing)
  ▪ in hospitalized patients with severe UC – add IV infliximab if no response to IV methylprednisolone within 3 days; then colectomy if inadequate response to drugs or no response to corticosteroids + infliximab
  ▪ biologics (infliximab, adalimumab, golimumab) can also be used for outpatients with moderate-severe disease, particularly those that are steroid-unresponsive or steroid-dependent
  ▪ azathioprine and 6-mercaptopurine: too slow to rapidly resolve acute relapse
  ▪ most commonly used to maintain remission as corticosteroids withdrawn
• surgical treatment curative
  ▪ aim for cure with colectomy; bowel continuity can be restored with ileal pouch-anal anastomosis (IPAA)
• indications: failure of adequate medical therapy, toxic megacolon, uncontrollable bleeding, pre-cancerous changes detected either by endoscopy or endoscopic biopsies (dysplasia), inability to taper corticosteroids, overt malignancy
Complications
• similar to CD, except
  ▪ more liver problems (especially PSC in men)
  ▪ greater risk of colorectal cancer
  ▪ risk increases with duration and extent of disease (5% at 10 yr, 15% at 20 yr for pancolitis; overall relative risk is 8%)
  ▪ risk also increases with active mucosal inflammation and sclerosing cholangitis
  ▪ thus, regular colonoscopy and biopsy in pancolitis of ≥8 yr is indicated
  ▪ toxic megacolon (transverse colon diameter >6 cm on abdominal x-ray) with immediate danger of perforation (see General Surgery, GS30)

Prognosis
• chronic relapsing pattern in most patients
• 10-15% chronic continuous pattern
• >1 attack in almost all patients
• more colonic involvement in the 1st yr correlates with increased severity of attacks and increased colectomy rate
  ▪ colectomy rate = 1% for all patients after the 1st yr; 20-25% eventually undergo colectomy
• normal life expectancy
• if proctitis only, usually benign course

Irritable Bowel Syndrome
Definition
• a form of functional bowel disease; more than just a label for GI symptoms unexplained after normal investigations

Epidemiology
• 20% of North Americans
• onset of symptoms usually in young adulthood
• F>M

Pathophysiology
• associated with either abnormal perception of intestinal activity or abnormal intestinal motility
• abnormal motility: multiple abnormalities described; unclear if associations or if causative
• psychological: stress may increase IBS symptoms but does not cause IBS
• types of IBS: IBS with diarrhea, IBS with constipation, IBS-mixed type (both diarrhea and constipation)

Diagnosis

Table 13. Rome III Criteria for Diagnosing Irritable Bowel Syndrome

<table>
<thead>
<tr>
<th>IBS Rome III Criteria</th>
</tr>
</thead>
<tbody>
<tr>
<td>≥12 wk in the past 12 mo of abdominal discomfort or pain that has 2 out of 3 features</td>
</tr>
<tr>
<td>• Relieved with defecation</td>
</tr>
<tr>
<td>• Associated with a change in frequency of stool</td>
</tr>
<tr>
<td>• Associated with a change in consistency of stool</td>
</tr>
<tr>
<td>The following are supportive, but not essential to the diagnosis:</td>
</tr>
<tr>
<td>• Abnormal stool frequency (≥3/d or &lt;3/wk)</td>
</tr>
<tr>
<td>• Abnormal stool form (lumpy/hard/loose/watery) ≥1/4 of defecations</td>
</tr>
<tr>
<td>• Abnormal stool passage (straining, urgency, feeling of incomplete evacuation) ≥1/4 of defecations</td>
</tr>
<tr>
<td>• Passage of mucus ≥1/4 of defecations</td>
</tr>
<tr>
<td>• Bloating</td>
</tr>
</tbody>
</table>

Diagnosis of IBS Less Likely in Presence of “Red Flag” Features

| Weight loss |
| Fever |
| Nocturnal defecation |
| Anemia |
| Blood or pus in stool |
| Abnormal gross findings on flexible sigmoidoscopy |

Investigations
• if history consistent with Rome III criteria, no alarm symptoms, and no family history of IBD or colorectal cancer, limited investigations required
• aim is to rule out diseases which mimic IBS, particularly celiac disease and IBD
• investigations can be limited to CBC, inflammatory markers (ESR, CRP) and celiac serology
• if available, fecal calprotectin is likely more reliable test to rule out IBD
• consider TSH, stool cultures depending on clinical circumstances
• consider colonoscopy (e.g. if alarming features present, family history of IBD or age > 50)

When Considering Complications of IBD, Think: ULCERATIVE COLITIS

| Urinary calculi |
| Liver problems |
| Cholelithiasis |
| Epithelial problems |
| Retardation of growth/sexual maturation |
| Arthritis |
| Thrombophlebitis |
| Iatrogenic complications |
| Vitamin deficiencies |
| Eyes |
| Colorectal cancer |
| Obstruction |
| Leakage (perforation) |
| Iron deficiency |
| Toxic megacolon |
| Inanition (wasting) |
| Strictures |

IBS Mimickers
• Enteric infections e.g. Giardia
• Lactose intolerance/other disaccharidase deficiency
• Crohn’s disease
• Celiac sprue
• Drug-induced diarrhea
• Diet-induced (excess tea, coffee, colas)
Treatment
- reassurance, explanation, support, aim for realistic goals
- relaxation therapy, biofeedback, hypnosis, stress reduction
- no therapeutic agent consistently effective, pain most difficult to control
- symptom-guided treatment
  - pain predominant
    - antispasmodic medication before meals (e.g. hyoscine, pinaverium, trimebutine)
    - increase dietary fibre (bran or psyllium)
  - tricyclic antidepressants (TCA), selective serotonin reuptake inhibitors (SSRI)
  - IBS with diarrhea (IBS-D)
    - increase dietary fibre (bran or psyllium) to increase stool consistency
    - loperamide (Imodium®)
    - diphenoxylate (Lomotil®)
    - cholestyramine 4 g QID
  - IBS with constipation (IBS-C)
    - exercise and increase fibre in diet
    - osmotic or other laxatives
  - mixed (alternating constipation and diarrhea) (IBS-M)

Prognosis
- 80% improve over time
- most have intermittent episodes
- normal life expectancy

Constipation

Definition
- passage of infrequent or hard stools with straining (stool water <50 mL/d); bowel frequency <3 times/wk

Epidemiology
- increasing prevalence with age; F>M
- rare in Africa and India where stool weight is 3-4x greater than in Western countries

Etiology
- most common: idiopathic attributed to colon dysmotility but this is difficult to measure
- organic causes
  - medication side effects (narcotics, antidepressants) are the most common
  - intestinal obstruction, left sided colon cancer (consider in older patients), and fecal impaction
  - metabolic
    - DM
    - hypothyroidism
    - hypercalcemia, hypokalemia, uremia
  - neurological
    - intestinal pseudo-obstruction
    - Parkinson's disease
    - MS
  - collagen vascular disease (e.g. scleroderma)
  - painful anal conditions (e.g. fissures)

Clinical Presentation
- overlaps with IBS
- stool firm, difficult to expel, passed with straining, abdominal pain relieved by defecation, flatulence, overflow diarrhea, tenesmus, abdominal distension, infrequent BMs (<3/wk)

Investigations
- underlying disease rarely found if constipation is the only presenting symptom
  - only test indicated in this situation is a CBC (2013 recommendation of American Gastroenterology Association), but also consider TSH, calcium, and glucose
  - colon visualization if concomitant symptoms such as rectal bleeding, weight loss, or anemia (colonoscopy, CT colonography)
  - if refractory to treatment, consider classification based on colon transit time; can measure colonic transit time with radio-opaque markers that are ingested and followed with a series of plain film abdominal x-rays (normal: 70 h)
  1. normal = misperception of normal defecation (IBS)
  2. prolonged throughout = "colonic inertia" (infrequent bowel movements with gas/bloating, tends to occur in youth)
  3. outlet obstruction = inability to coordinate pelvic floor muscles to empty rectum, straining, stool in rectum on digital exam, tends to occur in old age
- combination of 1 and 3 common

Rifaximin Therapy for Patients with Irritable Bowel Syndrome Without Constipation

Purpose: Previous evidence suggests that gut flora may play an important role in the pathophysiology of IBS. This study evaluated rifaximin, a minimally absorbed antibiotic, in treating IBS without constipation.

Methods: Two phase 3, double-blind, placebo-controlled trials (TARGET 1 and TARGET 2). 1,260 patients who had IBS without constipation were randomly assigned to rifaximin (550 mg dose) or placebo, 3 times daily for 2 wk, with a follow-up of 10 wk. The primary endpoint was adequate self-reported relief of global IBS symptoms.

Results: Significantly more patients in the rifaximin group had adequate self-reported relief of global IBS symptoms compared to the placebo group during the first 4 wk after treatment (40.8% vs. 31.2% respectively). Also, more patients in the rifaximin group had adequate relief of bloating compared to the placebo group (39.5% vs. 28.7% respectively).

Conclusions: Rifaximin therapy for 2 wk provided significant relief of symptoms, bloating, abdominal pain, and stool consistency associated with IBS without constipation.
Treatment (In order of Increasing Potency)
- dietary fibre
  - useful if mild or moderate constipation, but not if severe
  - aim for 30 g daily, increase dose slowly
- surface-acting (soften and lubricate)
- docusate salts, mineral oils
- osmotic agents (effective in 2-3 d)
  - lactulose, sorbitol, magnesium salts (e.g. magnesium hydroxide, i.e. milk of magnesia)
  - lactitol, polyethylene glycol 3350
- cathartics/stimulants (effective in 24 h)
  - castor oil, senna (avoid prolonged use to prevent melanosis coli), bisacodyl
- enemas and suppositories (e.g. saline enema, phosphate enema, glycerin suppository, bisacodyl suppository)
- prokinetic agents (prucalopride)
- linacotide (increases water secretion of bowel)

Upper Gastrointestinal Bleeding

Definition
- bleeding proximal to the ligament of Treitz, see Gastrointestinal Tract, G2 (75% of GI bleeds)
- ligament of Treitz: suspensory ligament where fourth portion of the duodenum transitions to jejunum

Etiology
- above the GE junction
  - epistaxis
  - esophageal varices (10-30%)
  - esophagitis
  - esophageal cancer
  - Mallory-Weiss tear (10%)
- stomach
  - gastric ulcer (20%) (see Peptic Ulcer Disease, G12)
  - gastritis (e.g. from alcohol or post-surgery) (20%)
  - gastric cancer
  - gastric antral vascular ectasia (rare, associated with cirrhosis and CTD)
  - Dieulafoy’s lesion (very rare)
- duodenum
  - ulcer in bulb (25%)
  - aortoenteric fistula: usually only if previous aortic graft (see sidebar, G25)
- coagulopathy (drugs, renal disease, liver disease)
- vascular malformation (Dieulafoy’s lesion, AVM)

Clinical Features
- in order of decreasing severity of the bleed: hematochezia > hematemesis > coffee ground emesis > melena > occult blood in stool

Treatment (initial)
- stabilize patient (1-2 large bore IVs, IV fluids, monitor)
- send blood for CBC, cross and type, platelets, PT, PTT, electrolytes, BUN, Cr, LFTs
- keep NPO
- consider NG tube to determine upper vs. lower GI bleeding in some cases
- endoscopy (OGD): establish bleeding site + treat lesion
  - if bleeding peptic ulcer: most commonly used method of controlling bleeding is injection of epinephrine around bleeding point + thermal hemostasis (bipolar electrocoagulation or heater probe); less often thermal hemostasis may be used alone, but injection alone not recommended
  - endoclip
  - hemospray
- IV PPI: decrease risk of rebleed if endoscopic predictors of rebleeding seen (see prognosis section)
  - given to stabilize clot, not to accelerate ulcer healing
  - if given before endoscopy, decreases need for endoscopic therapeutic intervention
- for variceal bleeds, octreotide 50 µg loading dose followed by constant infusion of 50 µg/h
- consider IV erythromycin (or metoclopamid) to accelerate gastric emptying prior to gastroscopy to remove clots from stomach

Prognosis
- 80% stop spontaneously
- peptic ulcer bleeding: low mortality (2%) unless rebleeding occurs (25% of patients, 10% mortality)
- endoscopic predictors of rebleeding: spurt or ooze, visible vessel, fibrin clot
- can send home if clinically stable, bleed is minor, no comorbidities, endoscopy shows clean ulcer with no predictors of rebleeding
- H₂-antagonists have little impact on rebleeding rates and need for surgery
- esophageal varices have a high rebleeding rate (55%) and mortality (29%)
Approach to Iron Deficiency Anemia

Figure 8. Approach to iron deficiency anemia

Esophageal Varices

Etiology
- almost always due to portal HTN
- often accompanied by varices in stomach

Clinical Features
- characteristically massive upper GI bleeding

Prognosis
- risk of bleeding: 30% in 1st yr
- risk of rebleeding: 50-70% (20% mortality at 6 wk)

Investigations
- endoscopy

Management

Mallory-Weiss Tear

Definition
- longitudinal laceration in gastric mucosa on lesser curvature near GE junction (20% straddle junction, 5% in distal esophagus)

Etiology
- due to rapid increases in gastric pressure from retching/vomiting against a closed glottis
- hiatus hernia usually present
**Clinical Features**
- hematemesis ± melena, classically following an episode of retching without blood
- can lead to fatal hematemesis

**Management**
- 90% stop spontaneously
- if persistent: endoscopy with epinephrine injection ± clips or surgical repair

## Lower Gastrointestinal Bleeding

### Definition
- bleed distal to ligament of Treitz

### Etiology
- if blood per rectum with hemodynamic instability, rule out upper GI source
- diverticular (60% from right colon)
- vascular
  - angiodysplasia (small vascular malformations of the gut)
  - anorectal (hemorrhoids, fissures)
- neoplasm
  - cancer
  - polyps
- inflammation
  - colitis (ulcerative, infectious, radiation, ischemic)
- post-polypectomy

### Clinical Features
- hematochezia (see Figure 10)
- anemia
- occult blood in stool
- rarely melena

### Treatment
- treat underlying cause

![Figure 10. Approach to hematochezia](image)

**Colorectal Carcinoma**
- see General Surgery, GS35

**Colorectal Polyps**
- see General Surgery, GS34
**Familial Colon Cancer Syndromes**

- see General Surgery, GS34

**Benign Anorectal Disease**

- see General Surgery, GS39

**Liver**

### Investigations of Hepatobiliary Disease

#### A. TESTS OF LIVER FUNCTION

**Table 14. Tests of Liver Function**

<table>
<thead>
<tr>
<th>Test</th>
<th>What Do Levels Correlate With?</th>
<th>Increased by</th>
<th>How to Interpret</th>
</tr>
</thead>
<tbody>
<tr>
<td>Prothrombin Time (PT or INR)</td>
<td>Hepatic protein synthesis All coagulation factors except VIII</td>
<td>Hepatocellular dysfunction Vitamin K deficiency (due to malnutrition, malabsorption, etc.)</td>
<td>PT/INR will promptly correct if vitamin K is administered, so increased PT/INR in absence of vitamin K deficiency is a reliable marker of hepatocellular dysfunction</td>
</tr>
<tr>
<td>Serum Albumin</td>
<td>Hepatic protein synthesis (and other causes listed in next column)</td>
<td>Hepatocellular dysfunction Malnutrition Renal or GI losses Significant inflammation Malignancy</td>
<td>Rule out potential causes other than hepatocellular dysfunction</td>
</tr>
<tr>
<td>Serum Direct Bilirubin*</td>
<td>Hepatic excretion from hepatocyte to biliary system</td>
<td>Liver dysfunction</td>
<td>Conjugation is preserved even in end stage liver failure, thus increased direct bilirubin indicates liver dysfunction</td>
</tr>
</tbody>
</table>

*Serum Bilirubin

- canalculus breakdown product of hemoglobin; metabolized in the reticuloendothelial system of liver, transported through biliary system, excreted via gut
- direct bilirubin = conjugated; indirect = unconjugated bilirubin

#### B. TESTS OF LIVER INJURY

- disproportionately increased AST or ALT = hepatocellular damage
  - ALT more specific to liver; AST from multiple sources (especially muscle)
  - elevation of both highly suggestive of liver injury
  - most common cause of elevated ALT is fatty liver
- disproportionately increased ALP (and GGT) = cholestasis (stasis of bile flow)
  - if ALP is elevated alone, rule out bone disease by fractionating ALP and/or checking GGT
  - if ALP elevation out of proportion to ALT/AST elevation, consider
    1. obstruction of common bile duct (extraluminal = pancreatic Ca, lymphoma; intraluminal = stones, cholangiocarcinoma, sclerosing cholangitis, helminths)
    2. destruction of microscopic ducts (e.g. PBC)
    3. bile acid transporter defects (drugs, intrahepatic cholestasis of pregnancy)
    4. infiltration of the liver (liver metastases, lymphoma, granulomas, amyloid)

---

**Acute Viral Hepatitis (General)**

**Definition**

- viral hepatitis lasting <6 mo

**Clinical Features**

- most are subclinical
- flu-like prodrome may precede jaundice by 1-2 wk
  - N/V, anorexia, taste/smell disturbance, headaches, fatigue, myalgia, low-grade fever
  - arthralgia and urticaria (especially HBV)
- only some progress to icteric (clinical jaundice) phase, lasting days to weeks
  - pale stools and dark urine 1-5 d prior to icteric phase
  - hepatomegaly and RUQ pain
  - splenomegaly and cervical lymphadenopathy (10-20% of cases)

---

All clotting factors except factor VIII and von Willebrand factor are exclusively synthesized in the liver. Factor VIII is also produced in the endothelium.

ALT > AST = most causes of hepatitis

AST > ALT = alcoholic liver disease or other causes of hepatitis (i.e. non-alcoholic liver disease) that have progressed to advanced cirrhosis.

Serum Transaminases >1000 due to

- Viral hepatitis
- Drugs
- Autoimmune hepatitis
- Hepatic ischemia
- Less often, common bile duct stone
Investigations
- AST and ALT (>10-20x normal in hepatocellular necrosis)
- ALP minimally elevated
- viral serology, particularly the IgM antibody directed to the virus

Treatment
- supportive (hydration, diet)
- usually resolves spontaneously, but if severe HBV infection, treatment with entecavir should be considered; in anicteric hepatitis C, anti-viral treatment should be considered (see hepatitis C)
- indications for hospitalization: encephalopathy, coagulopathy, severe vomiting, hypoglycemia

Prognosis
- poor prognostic indicators: comorbidities, persistently high bilirubin (>340 mmol; 20 mg/dL), increased INR, decreased albumin, hypoglycemia

Complications
- cholestasis (most commonly associated with HAV infection)
- hepatocellular necrosis: AST, ALT >10-20x normal, ALP and bilirubin minimally increased, increased cholestasis

Hepatitis A Virus
- RNA virus
- fecal-oral transmission; incubation period 4-6 wk
- diagnosed by elevated transaminases, positive anti-HAV IgM
- in children: characteristically asymptomatic
- in adults: fatigue, nausea, arthralgia, fever, jaundice
- can cause acute liver failure and subsequent death (<1-5%)
- can relapse, but never becomes chronic

Hepatitis B Virus

<table>
<thead>
<tr>
<th>Table 15. Hepatitis B Serology</th>
</tr>
</thead>
<tbody>
<tr>
<td>HBsAg</td>
</tr>
<tr>
<td>Acute HBV</td>
</tr>
<tr>
<td>Chronic (e-Ag positive) HBV (generally high HBV DNA)</td>
</tr>
<tr>
<td>Chronic (e-Ag negative) HBV (generally low HBV DNA)</td>
</tr>
<tr>
<td>Resolved infection</td>
</tr>
<tr>
<td>Immunization</td>
</tr>
</tbody>
</table>

Figure 11. Time course of acute hepatitis B infection

Epidemiology
- 4 phases of chronic hepatitis B: not all carriers will go through all 4 phases, but all carriers will have positive HBsAg
  1. immune tolerance: extremely high HBV-DNA (>20,000 IU/mL), HBeAg positive, but normal ALT/AST; due to little immune control and minimal immune-mediated liver damage; characteristic of perinatal infection (or ‘incubation period’ in adult with newly-acquired HBV)
2. immune clearance (or immunoactive): falling but still elevated HBV-DNA levels (>20,000 IU/mL), HBeAg positive; due to immune attack on the virus and immune-mediated liver damage; characterized by progressive disease without treatment and increasing liver fibrosis (sometimes progressing to cirrhosis and/or hepatocellular carcinoma); likely to benefit from treatment

3. immune control: lower HBV-DNA (<20,000 IU/mL), HBeAg negative, anti-HBe positive, ALT/AST normal; due to immune control without immune-mediated liver damage; risk of reactivation to phase 2 (clinically resembles acute hepatitis B), especially with immunosuppression e.g. corticosteroids or chemotherapy

4. immune escape ("core or precore mutant"): elevated HBV-DNA (>2,000 IU/mL), HBeAg negative because of pre-core or core promoter gene mutation, anti-HBe positive, ALT/AST high; characterized by progressive disease without treatment and increasing liver fibrosis (sometimes progressing to cirrhosis and/or hepatocellular carcinoma); likely to benefit from treatment

Treatment
- counselling: 40% of men and 10% of women with perinatal infection will die from HBV-related complications
- prolonged immune-mediated damage leads to higher risk of liver fibrosis
- hepatocellular carcinoma screening with ultrasound q6mo, especially if high serum HBV-DNA levels, cirrhosis, men, (age >40 in Asian men, >50 in Asian women, and >20 in African descent)
- consider pharmacological therapy if
  - 1. HBeAg positive + HBV-DNA >20, 000 IU/mL + elevated ALT; or
  - 2. HBeAg negative + HBV-DNA >2,000 IU/mL + elevated ALT ± stage ≥2 fibrosis on liver biopsy
- 3. treat to reduce serum HBV-DNA to undetectable level
- treatment options: interferon, tenofovir, entacavir, lamivudine
- vaccinate against HAV if serology negative (to prevent further liver damage)
- follow blood and sexual precautions

Hepatitis D
- defective RNA virus requiring HBsAg for entry into hepatocyte, therefore infects only patients with HBV; causes more aggressive disease than hepatitis B virus alone
- coinfection: acquire HDV and HBV at the same time
- better prognosis than superinfection (acute HDV infection on pre-existing HBV infection)
- HDV can present as ALF and/or accelerate progression to cirrhosis
- treatment: low-dose interferon (20% response) and liver transplant for end-stage disease

Hepatitis C Virus
- RNA virus (7 genotypes; genotype 1 is most common in North America)
- blood-borne transmission; sexual transmission is "inefficient"
- major risk factor: injection drug use
- other risk factors: blood transfusion received before 1992 (or received in developing world), tattoos, intranasal cocaine use
- clinical manifestation develops 6-8 wk after exposure
  - symptoms mild and vague (fatigue, malaise, nausea) therefore not commonly diagnosed in acute stage

Diagnosis
- suspected on basis of elevated ALT/AST and positive serum anti-HCV
- diagnosis established by detectable HCV-RNA in serum
- virus genotype correlates with response to treatment but not prognosis
  - serum HCV-RNA inversely correlates with response to treatment
- normal transaminases can have underlying cirrhosis on biopsy, but otherwise excellent prognosis

Treatment
- blood-borne precautions; vaccinate for hepatitis A and B if serology negative; avoid alcohol
- clearest indication for treatment is in subgroup likely to develop clinically significant liver disease
  - persistently elevated transaminases, liver biopsy shows fibrosis/cirrhosis and at least moderately severe necrosis/inflammation
- previous standard of care was pegylated interferon-α + ribavirin + a direct-acting anti-viral agent aiming to clear HCV infection, but <90% success rate and side effects common
- as of 2015, all oral interferon-free regimens (e.g. sofosbuvir/ledipasvir or ombitasvir/paritaprevir/ritonavir+dasabuvir) are now becoming the standard of care with >90% success rate including those who failed previous interferon-based treatment
Prognosis
- 80% of acute hepatitis C become chronic (of these 20% evolve to cirrhosis)
- risk of hepatocellular carcinoma increases if cirrhotic
- can cause cryoglobulinemia; associated with membranoproliferative glomerulonephritis, lymphoma

</tr>
</tbody>
</table>
Autoimmune Chronic Active Hepatitis

- diagnosis of exclusion: rule out viruses, drugs, metabolic, or genetic causes
- can be severe: 40% mortality at 6 mo without treatment
- extrahepatic manifestations
  - sicca, Raynaud's, thyroiditis, Sjögren's, arthralgias
  - hypergammaglobulinemia
  - anti-smooth muscle antibody elevation is most characteristic; also elevations in
    - anti-LKM elevation (liver kidney microsome), especially in children
    - less specific: elevated ANA, RF
  - can have false positive viral serology (especially anti-HCV)
  - biopsy – periportal (zone 1) and interface inflammation and necrosis
- treatment: corticosteroids (80% respond) ± azathioprine (without this, most will relapse as corticosteroids are withdrawn)

Specific Drugs

- acetaminophen
  - metabolized by hepatic cytochrome P450 system
  - can cause ALF (transaminases >1,000 U/L followed by jaundice and encephalopathy)
  - requires 10-15 g in healthy, 4-6 g in alcoholics/anticonvulsant users
  - mechanism: high acetaminophen dose saturates glucuronidation and sulfation elimination pathways → reactive metabolite is formed → covalently binds to hepatocyte membrane
  - presentation
    - first 24 h: N/V (usually within 4-12 h of overdose)
    - 24-48 h: asymptomatic, but ongoing hepatic necrosis resulting in increased transaminases
    - >48 h: continued hepatic necrosis possibly complicated with ALF or resolution
  - note: potential delay in presentation in sustained-release products
  - blood levels of acetaminophen correlate with the severity of hepatic injury, particularly if time of ingestion known
  - therapy
    - gastric lavage/emacsion (if <2 h after ingestion)
    - oral activated charcoal
    - N-acetylcysteine (NAC, Mucomyst®) can be given PO or IV (most effective within 8-10 h of ingestion, but should be given no matter when time of ingestion)
      - promotes hepatic glutathione regeneration
      - no recorded fatal outcomes if NAC given before increase in transaminases
- chlorpromazine: cholestasis in 1% after 4 wk; often with fever, rash, jaundice, pruritus, and eosinophilia
- INH (isoniazid)
  - 20% develop elevated transaminases but <1% develop clinically significant disease
  - susceptibility to injury increases with age
- methotrexate
  - causes fibrosis/cirrhosis; increased risk in the presence of obesity, DM, alcoholism (i.e. with underlying risk for pre-existing fatty liver)
  - scarring develops without symptoms or changes in liver enzymes, therefore biopsy may be needed in long-term treatment
- amiodarone: can cause same histology and clinical outcome as alcoholic hepatitis
- others: azoles, statins, methylxop, phenytoin, propylthiouracil (PTU), rifampin, sulfonamides, tetracyclines
- herbs: chaparral, Chinese herbs (e.g. germander, comfrey, bush tea)

Hy's Law: drug-induced hepatocellular jaundice indicates a mortality of at least 10%
Wilson’s Disease

Definition
• autosomal recessive defect in copper metabolism (gene ATP7B)

Etiology
• decreased biliary excretion of copper plus decreased incorporation of copper into ceruloplasmin

Clinical Features
• liver: acute hepatitis, acute liver failure, chronic active hepatitis, cirrhosis, low risk of hepatocellular carcinoma
• eyes: Kayser-Fleischer rings (copper deposits in Descemet’s membrane); more common in patients with CNS involvement, present in 50% if only liver involvement
• CNS: basal ganglia (wing flapping tremor, Parkinsonism), cerebellum (dysarthria, dysphagia, incoordination, ataxia), cerebrum (psychosis, affective disorder)
• kidneys: Fanconi’s syndrome (proximal tubule transport defects) and stones
• blood: intravascular hemolysis; may be initial presentation in fulminant hepatitis
• joints: arthritis, bone demineralization, calcifications

Investigations
• suspect if increased liver enzymes with clinical manifestations at young age (<30); especially combination of liver disease with dystonia, psychiatric symptoms
• screening tests
  1. reduced serum ceruloplasmin (<50% of normal)
  2. Kayser-Fleischer rings (usually require slit-lamp examination)
  3. increased urinary copper excretion
• gold standard
  1. increased copper on liver biopsy by quantitative assay
  2. genetic analysis imperfect as many mutations in ATP7B are possible

Treatment
• 4 drugs available
  1. penicillamine chelates copper, poorly tolerated
  2. trientine chelates copper
  3. zinc impairs copper excretion in stool and decreases copper absorption from gut
  4. tetrathiomolybdate preferred if neurological involvement
• screen relatives
• liver transplant in severe cases

Hemochromatosis

Definition
• excessive iron storage causing multiorgan system dysfunction (liver, in particular) with total body stores of iron increased to 20–40 g (normal 1 g)

Etiology
• primary (hereditary) hemochromatosis
  ▪ hepcidin deficiency results in ongoing gut absorption of iron despite adequate iron stores
  ▪ results in ongoing gut absorption of iron despite adequate iron stores
• secondary hemochromatosis
  ▪ parenteral iron overload (e.g. transfusions)
  ▪ chronic hemolytic anemia: thalassemia, pyruvate kinase deficiency
  ▪ excessive iron intake

Epidemiology
• hereditary hemochromatosis most common in Northern European descent
  ▪ primarily due to common recessive gene (HFE, 5%); 1/400 patients are homozygotes

Clinical Features
• usually presents with trivial elevation in serum transaminases
• liver: cirrhosis (30%), HCC (200x increased risk) – most common cause of death (1/3 of patients)
• pancreas: DM, chronic pancreatitis
• skin: bronze or grey (due to melanin, not iron)
• heart: dilated cardiomyopathy
• pituitary: hypogonadotropic hypogonadism (impotence, decreased libido, amenorrhea)
• joints: arthralgia (any joint, but especially MCP joints), chondrocalcinosis
Investigations
- screening for individuals with clinical features and/or family history (1/4 chance of sibling having the disease)
  - transferrin saturation (free Fe²⁺/TIBC) >45%
  - serum ferritin >400 ng/mL
  - HFE gene analysis: 90% of primary hemochromatosis involves C282Y allele, while H63D and S65C alleles also commonly involved and screened
- liver biopsy (generally used to detect cirrhosis or if potential for other causes of liver disease)
  - markers of advanced fibrosis: if any of the following are present at the time of diagnosis → age >40, elevated liver enzymes, or ferritin >1000
  - considered if compound heterozygote and potential other cause of liver injury (e.g. fatty liver, etc.)
  - if C282Y/C282Y and no markers of advanced fibrosis, then biopsy generally not needed
- HCC screening if cirrhosis

Treatment
- phlebotomy: weekly or q2wk then lifelong maintenance phlebotomies q2-6mo
- deferoxamine if phlebotomy contraindicated (e.g. cardiomyopathy, anemia)
- primary hemochromatosis responds well to phlebotomy
- secondary hemochromatosis usually requires chelation therapy (administration of agents that bind and sequester iron, and then excreted)

Prognosis
- normal life expectancy if treated before the development of cirrhosis or DM

Alcoholic Liver Disease

Definition
- fatty liver (all alcoholics): always reversible if alcohol stopped
- alcoholic hepatitis (35% of alcoholics): usually reversible if alcohol stopped
- cirrhosis (10-15% of alcoholics): potentially irreversible

Pathophysiology
- several mechanisms, poorly understood
- ethanol oxidation to acetaldehyde
  - reduces NAD⁺ to NADH; increased NADH decreases ATP supply to liver, impairing lipolysis so fatty acids and triglycerides accumulate in liver
  - binds to hepatocytes evoking an immune reaction
- ethanol increases gut permeability leading to increased bacterial translocation
- alcohol metabolism causes
  - relative hypoxia in liver zone III (near central veins; poorly oxygenated) > zone I (around portal tracts, where oxygenated blood enters)
  - necrosis and hepatic vein sclerosis
- histology of alcoholic hepatitis
  - ballooned (swollen) hepatocytes often containing Mallory bodies, characteristically surrounded by neutrophils
  - large fat globules
  - fibrosis: space of Disse and perivenular

Clinical Features
- >2-3 standard drinks/d in females and >3-6 standard drinks/d in men for >10 yr leads to cirrhosis, but only in about 10-20% of those who consume this amount daily on a continuous basis; cirrhosis risk increases with amount of alcohol consumed above threshold
- clinical findings do not accurately predict type of liver involvement
  - fatty liver
    - mildly tender hepatomegaly; jaundice rare
    - mildly increased transaminases <5x normal
  - alcoholic hepatitis
    - variable severity: mild to fatal liver failure
    - mild: stops drinking because feels unwell, resumes when feeling better (if assessed, findings of hepatitis, potentially mild jaundice, and mildly elevated INR)
    - severe: stops drinking but feels unwell, low grade fever, RUQ discomfort, increased white blood cell count – mimics RLL pneumonia and cholecystitis

Investigations
- blood tests are non-specific, but in general
  - AST:ALT ≥2:1 (usually <300)
  - increased GGT
  - CBC: increased MCV, increased WBC
Treatment
• alcohol cessation (see Psychiatry, PS25)
  ▪ Alcoholics Anonymous, disulfiram, naltrexone, acamprosate
• multivitamin supplements (especially thiamine)
• caution with drugs metabolized by the liver
• if icteric alcoholic hepatitis prednisone 40 mg OD x 28 d in subgroup with elevated bilirubin and INR (Maddrey’s discriminant function > 32); but contraindicated in GI bleeding, renal failure, infection, pancreatitis
  ▪ response (and subsequent decision to continue treatment) predicted by day 7 bilirubin (Lille score)
• pentoxyfilline reported to be beneficial in one of three studies, but most definitive trial shows no benefit (see Landmark Trials, G51)

Prognosis
• Maddrey’s discriminant function (based on PT and bilirubin) and MELD predict mortality and guide treatment
• fatty liver: complete resolution with cessation of alcohol intake
• alcoholic hepatitis mortality
  ▪ immediate: 30%-60% in the first 6 mo if severe
  ▪ with continued alcohol: 70% in 5 yr
  ▪ with cessation: 30% in 5 yr

Non-Alcoholic Fatty Liver Disease

Definition
• spectrum of disorders characterized by macrovesicular hepatic steatosis
• most common cause of liver disease in North America

Etiology
• pathogenesis not well elucidated; insulin resistance implicated as key mechanism, leading to hepatic steatosis
• changes indistinguishable from those of alcoholic hepatitis despite negligible history of alcohol consumption

Risk Factors
• likely a component of the metabolic syndrome along with type 2 DM, HTN, hypertriglyceridemia
• rapid weight loss or weight gain

Clinical Features
• often asymptomatic
• may present with fatigue, malaise, and vague RUQ discomfort
• elevated serum triglyceride/cholesterol levels and insulin resistance

Investigations
• elevated serum AST, ALT ± ALP; AST/ALT <1
• presents as echogenic liver texture on ultrasound
• liver biopsy diagnostic, but often necessary only for prognosis

Treatment
• no proven effective therapy other than gradual weight loss
• some evidence for vitamin E (800 U daily) in select groups
  ▪ pioglitazone can be considered if DM concomitantly present, but results in weight gain
• modification of risk factors is generally recommended, especially gradual weight reduction
• optimization of therapy for DM, hyperlipidemia, HTN
• some evidence for benefits of coffee drinking (3 cups per day)

Prognosis
• most die from cardiovascular or cerebrovascular disease
• better prognosis than alcoholic hepatitis
  ▪ <25% progress to cirrhosis over a 7-10 yr period
• risk of progression increases if inflammation or scarring occurs alongside fat infiltration (non-alcoholic steatohepatitis)
• other clinical indicators of unfavourable prognosis: DM, age, metabolic syndrome
Acute Liver Failure (formerly Fulminant Hepatic Failure)

**Definition**
- severe decline in liver function characterized by coagulation abnormality (INR>1.5) and encephalopathy
- in setting of previously normal liver
- rapid (<26 wk duration)

**Etiology**
- drugs (especially acetaminophen), hepatitis B (measure anti-HBc, IgM fraction because sometimes HBV-DNA and even HBsAg rapidly becomes negative), hepatitis A, hepatitis C (rare), ischemic, idiopathic

**Treatment**
- correct hypoglycemia, monitor level of consciousness, prevent GI bleeding with PPI, monitor for infection and multiorgan failure (usually requires ICU)
- consider liver biopsy before INR becomes too high
- chief value is to exclude chronic disease, less helpful for prognosis
- liver transplant (King's College criteria can be used as prognostic indicator): consider early, especially if time from jaundice to encephalopathy >7 d (e.g. not extremely rapid), age <10 or >40, cause is drug or unknown, bilirubin >300 µmol/L, INR >3.5, creatinine >200 µmol/L

Cirrhosis

**Definition**
- liver damage characterized by diffuse distortion of the basic architecture and replacement with scar tissue and formation of regenerative nodules
- Stage 1 cirrhosis is compensated and asymptomatic, can last for 10-20 yr with almost normal life expectancy
- Stage 2 cirrhosis is the onset of first decompensation, typically development of ascites (most common), variceal bleeding, encephalopathy

**Etiology**
- fatty liver (alcoholic or non-alcoholic fatty liver disease)
- chronic viral hepatitis (B, B+D, C; not A or E)
- autoimmune hepatitis
- hemochromatosis
- primary biliary cirrhosis
- chronic hepatic congestion
  - cardiac cirrhosis (chronic right heart failure, constrictive pericarditis)
  - hepatic vein thrombosis (Budd-Chiari)
- cryptogenic (i.e. no identifiable cause, although many of these patients may represent "burnt-out NASH")
  - rare: Wilson's disease, Gaucher's disease, α1-antitrypsin deficiency

**Investigations**
- definitive diagnosis is histologic (liver biopsy)
- other tests may be suggestive
  - blood work: fall in platelet count <150 is the earliest finding, followed many years later with rise in INR, fall in albumin, rise in bilirubin, fall in glucose level (pre-terminal event)
  - FibroTest: combination of various clinical and biochemical markers that can predict degree of fibrosis
  - imaging
    - U/S is the primary imaging modality but only finds advanced cirrhosis
    - CT to look for varices, nodular liver texture, splenomegaly, ascites
    - Ultrasound elastography (FibroScan): non-invasive tool using elastography (variable availability)
    - gastroscopy: varices or portal gastropathy

**Treatment**
- treat underlying disorder
- decrease insults (e.g. alcohol cessation, hepatotoxic drugs, immunize for Hep A and B if non-immune)
- follow patient for complications (esophageal varices, ascites, HCC defines stage 2 cirrhosis)
- prognosis: Child-Pugh Score and MELD score
- liver transplantation for end-stage disease if no alcohol for >6 mo; use MELD score

Figure 12. Progression of liver dysfunction based on liver function tests – the "W"

MELD (Model for End Stage Liver Disease)
- Predicts 3 mo survival and used to stratify patients on transplant list
- Based on creatinine, INR, and total bilirubin
Table 18. Child-Pugh Score and Interpretation

Score: 5-6 (Child’s A), 7-9 (Child’s B), 10-15 (Child’s C)

*Note: Child’s classification is rarely used for shunting, (TIPS or other surgical shunts) but is still useful to quantitate the severity of cirrhosis

Complications

- hematologic changes in cirrhosis
  - pancytopenia from hypersplenism: platelets first, then WBC, then hemoglobin
  - decreased clotting factors resulting in elevated INR
  - relationship of INR to bleeding tendency is controversial; some patients may be hypocoagulable, others may be hypercoagulable
- variceal bleeds
  - half of patients with cirrhosis have gastroesophageal varices and one-third of these develop hemorrhage with an overall mortality of >30%
  - hepatic venous pressure gradient (HVPG) ≥10 mmHg is the strongest predictor of variceal development
  - treatment: resuscitation, antibiotic prophylaxis, vasoactive drugs (e.g. octreotide IV) combined with endoscopic band ligation or sclerotherapy, TIPS
- renal failure in cirrhosis
  - classifications
    - pre-renal (usually due to over-diuresis)
    - acute tubular necrosis
    - HRS
      - Type I: sudden and acute renal failure (rapid doubling of creatinine over 2 wk)
      - Type II: gradual increase in creatinine with worsening liver function (creatinine doubling over years)
  - HRS can occur at any time in severe liver disease, especially after
    - overdiuresis or dehydration, such as diarrhea, vomiting, etc.
    - GI bleed
    - sepsis
  - treatment for hepatorenal syndrome (generally unsuccessful at improving long-term survival)
    - for type I HRS: octreotide + midodrine + albumin (increases renal blood flow by increasing systemic vascular resistance)
    - definitive treatment is liver transplant
- hepatopulmonary syndrome
  - majority of cases due to cirrhosis, though can be due to other chronic liver diseases, such as non-cirrhotic portal HTN
  - thought to arise from ventilation-perfusion mismatch, intrapulmonary shunting and limitation of oxygen diffusion, failure of damaged liver to clear circulating pulmonary vasodilators vs. production of a vasodilating substance by the liver
  - clinical features
    - hyperdynamic circulation with cardiac output >7 L/min at rest and decreased pulmonary + systemic resistance (intrapulmonary shunting)
    - dyspnea, platypnea (increase in dyspnea in upright position, improved by recumbency), and orthodeoxia (desaturation in the upright position, improved by recumbency)
    - diagnosis via contrast-enhanced echocardiography: inject air bubbles into peripheral vein; air bubbles appear in left ventricle after third heartbeat (normal = no air bubbles; in ventricular septal defect, air bubbles seen <3 heart beats)
    - only proven treatment is liver transplantation

Usual causes of death in cirrhosis: renal failure (hepatorenal syndrome), sepsis, GI bleed, or HCC

Hepatorenal Syndrome vs. Pre-Renal Failure – Difficult to Differentiate
- Similar blood and urine findings, (see Nephrology, NP17)
- Urine sodium: very low in hepatorenal; low in pre-renal
- Intravenous fluid challenge: giving volume expanders improves pre-renal failure, but not hepatorenal syndrome

Hepatopulmonary Syndrome
- Clinical triad
  - Liver disease
  - Increased alveolar-arterial gradient while breathing room air
  - Evidence for intrapulmonary vascular abnormalities
- Fibrosis may regress and disappear if cause of liver injury is treated or resolves
**Hepatocellular Carcinoma**

- see General Surgery, GS45

**Liver Transplantation**

- see General Surgery, GS46

**Portal Hypertension**

Definition

- pressure gradient between hepatic vein pressure and wedged hepatic vein pressure (corrected sinusoidal pressure) >5 mmHg

Pathophysiology

- 3 sites of increased resistance (remember pressure = flow x resistance)
  - pre-sinusoidal (e.g. portal vein thrombosis, schistosomiasis, sarcoidosis)
  - sinusoidal (e.g. cirrhosis, alcoholic hepatitis)
  - post-sinusoidal (e.g. right-sided heart failure, hepatic vein thrombosis, veno-occlusive disease, constricive pericarditis)

Complications

- GI bleeding from varices in esophagus, less commonly in stomach, even less frequently from portal hypertensive gastropathy
- ascites
- hepatic encephalopathy
- thrombocytopenia
- renal dysfunction
- sepsis
- arterial hypoxemia

Treatment

- non-selective β-blockers (propanolol, nadolol) decrease risk of bleeding from varices
- TIPS: to decrease portal venous pressure
  - radiologically inserted shunt between portal and hepatic vein via transjugular vein catheterization and percutaneous puncture of portal vein
  - can be used to stop acute bleeding or prevent rebleeding or treat ascites
  - shunt usually remains open for <1 yr
  - complications: hepatic encephalopathy, deterioration of hepatic function
  - contraindicated with severe liver dysfunction
  - most commonly used as a “bridge” to liver transplant
- other surgically created shunts: portacaval, distal spleno-renal (Warren shunt) - all used only rarely in the modern era

**Hepatic Encephalopathy**

Definition

- spectrum of potentially reversible neuropsychiatric syndromes secondary to liver disease diagnosed after ruling out other causes for symptoms (e.g. structural/metabolic)

Pathophysiology

- portosystemic shunt around hepatocytes and decreased hepatocellular function increase level of systemic toxins (believed to be ammonia from gut, mercaptans, fatty acids, amino acids) which go to the brain
Precipitating Factors
- nitrogen load (GI bleed, protein load from food intake, renal failure, constipation)
- drugs (narcotics, CNS depressants)
- electrolyte disturbance (hypokalemia, alkalosis, hypoxia, hypovolemia)
- infection (spontaneous bacterial peritonitis)
- deterioration in hepatic function or superimposed liver disease

Stages
- I: apathy, restlessness, reversal of sleep-wake cycle, slowed intellect, impaired computational abilities, impaired handwriting
- II: asterixis, lethargy, drowsiness, disorientation
- III: stupor (rousable), hyperactive reflexes, extensor plantar response (upgoing Babinski)
- IV: coma (response to painful stimuli only)

Investigations
- clinical diagnosis: supported by laboratory findings and exclusion of other neuropsychiatric diseases
- rule out
  - non-liver-related neuropsychiatric disease in a patient with liver problems (e.g. alcohol withdrawal or intoxication, sedatives, subdural hematoma, metabolic encephalopathy)
  - causes of metabolic encephalopathy (e.g. renal failure, respiratory failure, severe hyponatremia, hypoglycemia)
- characteristic EEG findings: diffuse (non-focal), slow, high amplitude waves
- serum ammonia levels increased, but not often necessary to measure in routine clinical use

Treatment
- treat underlying precipitating factors
- decrease generation of nitrogenous compounds
  - routine protein restriction is no longer recommended given patients generally have concurrent malnutrition and muscle wasting; however, vegetable protein is better tolerated than animal protein
  - lactulose: titrated to achieve 2-3 soft stools/d
    - prevents diffusion of NH₃ (ammonia) from the colon into blood by lowering pH and forming non-diffusible NH₄ (ammonium)
    - serves as a substrate for incorporation of ammonia by bacteria, promotes growth in bowel lumen of bacteria which produce minimal ammonia
    - also acts as a laxative to eliminate nitrogen-producing bacteria from colon
  - if inadequate response with lactulose may try antibiotics
    - broad-spectrum antibiotics (metronidazole, rifaximin) eliminate ammonia producing bacteria from bowel lumen
    - non-absorbable antibiotic rifaximin probably most effective treatment but not readily available in Ontario
- best acute treatment in comatose patient is lactulose enemas

Ascites

Definition
- accumulation of excess fluid in the peritoneal cavity

Etiology

| Table 19. Serum-Ascites Albumin Gradient as an Indicator of the Causes of Ascites |
|---------------------------------|---------------------------------|
| Serum [Alb] – Ascitic [Alb] >11 g/L (1.1 g/dL) | Serum [Alb] – Ascitic [Alb] <11 g/L (1.1 g/dL) |
| Portal Hypertension Related | Non-Portal Hypertension Related |
| Cirrhosis/severe hepatitis | Peritoneal carcinomatosis |
| Chronic hepatic congestion (right heart failure, Budd-Chiari) | TB |
| Massive liver metastases | Pancreatic disease |
| Myxedema | Serositis |
| | Nephrotic syndrome* |

* In nephrotic syndrome: decreased serum [Alb] to begin with therefore gradient not helpful

Pathophysiology
- key factor in pathogenesis is increased sodium (and water) retention by the kidney for reasons not fully understood. Theories include:
  - underfill hypothesis: first step in ascites formation is increased portal pressure and low oncotic pressure (e.g. low serum albumin) driving water out of the splanchic portal circulation into abdominal cavity; the resulting decreased circulating volume causes secondary sodium retention by the kidney
  - overfill hypothesis: cirrhosis directly causes increased sodium retention by the kidney in the absence of hypovolemia and ascites arises secondarily
- peripheral arterial vasodilation theory (most popular): as portal HTN develops in cirrhosis, production of local mediators such as nitric oxide lead to splanchnic arterial vasodilation which ultimately results in reduction of effective arterial volume and compensatory sodium and fluid retention by the kidneys (i.e. circulation volume is increased, as per overflow hypothesis, but relatively underfilled, as per underfill hypothesis)

**Diagnosis**
- abdominal ultrasound
- physical exam (clinically detectable when >500 mL)
  - bulging flanks, shifting dullness, fluid-wave test positive
- most sensitive symptom: ankle swelling

**Investigations**
- diagnostic paracentesis
  - 1st aliquot: cell count
  - 2nd aliquot: chemistry (especially albumin, but also total protein; amylase if pancreatitis; TG and chylomicrons if turbid and suspect chylous ascites)
  - 3rd aliquot: C&S, Gram stain
  - 4th aliquot: cytology (usually positive in peritoneal carcinomatosis)

**Treatment**
- non-refractory ascites
  - Na+ restriction (daily sodium intake <2 g)
  - diuretics: spironolactone, furosemide
  - aim for weight loss 0.5-1 kg/d, more if concomitant peripheral edema (which is mobilized quicker than ascitic fluid); overly rapid weight loss increases risk of renal failure
  - double diuretic dose every 2-4 wk to achieve weight loss target
- refractory ascites (diuretics are inadequate or not tolerated)
  - therapeutic paracentesis with intravenous albumin paracentesis
- TIPS in an appropriate patient (no contraindications) with potential transplant-free survival advantage
- liver transplantation should be considered in every case, since development of ascites in patients with cirrhosis is associated with 50% 2 yr mortality

**Complication: Primary/Spontaneous Bacterial Peritonitis**
- primary/spontaneous bacterial peritonitis (SBP)
  - complicates ascites, but does not cause it (occurs in 10% of cirrhotic ascites); higher risk in patients with GI bleed
  - 1/3 of patients are asymptomatic, thus do not hesitate to do a diagnostic paracentesis in ascites even if no clinical indication of infection
  - fever, chills, abdominal pain, ileus, hypotension, worsening encephalopathy, acute kidney injury
  - Gram-negatives compose 70% of pathogens: E. coli (most common), Streptococcus, Klebsiella
  - diagnosis
    - absolute neutrophil count in peritoneal fluid >0.25x10⁹ cells/L (250 cells/mm³)
    - Gram stain positive in only 10-50% of patients
    - culture positive in <80% of patients (not needed for diagnosis)
  - prophylaxis: consider in patients with
    - cirrhosis or GI bleed: ceftriaxone IV daily or norfloxacin bid x 7 d
    - previous episode of SBP: long-term prophylaxis with daily norfloxacin or TMP-SMX
  - treatment
    - IV antibiotics (cefotaxime 2 g IV q8h or ceftriaxone 2g IV daily is the treatment of choice for 5 d; modify if response inadequate or culture shows resistant organisms)
    - IV albumin (1.5 g/kg at time of diagnosis and 1 g/kg on day 3) decreases mortality by lowering risk of acute renal failure

---

**Biliary Tract**

**Jaundice**
- see Table 2, G6 and Figures 15 and 16, G42

**Signs and Symptoms**
- dark urine, pale stools: suggests that bilirubin elevation is from direct fraction
- pruritus: suggests chronic disease, cholestasis
- abdominal pain: suggests biliary tract obstruction from stone or pancreatic tumour (obstructive jaundice)
- painless jaundice in the elderly: think of pancreatic cancer, although most patients with pancreatic cancer have pain
- kernicterus: rarely seen in adults due to maturation of blood brain barrier
Investigations
• blood work: CBC, bilirubin (direct and total), liver enzymes (AST, ALT, ALP, GGT), liver function tests (INR/PT, PTT, albumin), amylase
• U/S or CT for evidence of bile duct obstruction (e.g. bile duct dilation)
• direct bile duct visualization
  ▪ magnetic resonance cholangiopancreatography (MRCP): non-invasive
  ▪ endoscopic ultrasound (EUS): sensitive for stones and pancreatic tumours
  ▪ endoscopic retrograde cholangiopancreatography (ERCP): invasive, most accurate, allows for therapeutic intervention
  ▪ percutaneous transhepatic cholangiography (PTC): if ERCP fails (endoscopic access not possible)

Figure 14. Approach to jaundice

Gilbert’s Syndrome

Definition
• mild decrease in glucuronyltransferase activity leading to defective conjugation of bilirubin
• an abnormality of bilirubin metabolism with no clinical relevance

Etiology/Epidemiology
• some patients have decreased hepatobiliary uptake
• affects 7% of population, especially males
• autosomal dominant, 70% due to a mutation in the UGT gene

Clinical Features
• presents in teens-20s, often an incidental finding
• only manifestation is intermittent jaundice with increased serum unconjugated bilirubin developing most characteristically while fasting, or at times of acute illness; no other clinical implications

Treatment
• none indicated (entirely benign)

Sclerosing Cholangitis

Definition
• narrowing of biliary tree (intra and/or extrahepatic bile ducts) from scarring

Etiology
• primary/idiopathic (most common)
  ▪ associated with IBD, more commonly UC, in up to 70% of patients (usually male)
  ▪ one of the most common indications for liver transplant
• secondary (less common)
  ▪ long-term choledocholithiasis
  ▪ cholangiocarcinoma
  ▪ surgical/traumatic injury (iatrogenic)
  ▪ contiguous inflammatory process
  ▪ post-ERCP
  ▪ associated with HIV/AIDS ("HIV cholangiopathy")
  ▪ IgG4-related disease

Signs and Symptoms
• often insidious, may present with fatigue and pruritus
• may present with signs of episodic bacterial cholangitis secondary to biliary obstruction

Investigations
• increased ALP (hallmark), less often increased bilirubin
• mildly increased AST, usually <300 U/L
• p-ANCA (30-80%), elevated IgM (40-50%)
• ERCP shows narrowing and dilatations of bile ducts that may result in "beading", both intrahepatic and extrahepatic bile ducts
  ▪ if intrahepatic narrowing only, do anti-mitochondrial antibody to rule out PBC

Complications
• repeated bouts of cholangitis may lead to complete biliary obstruction with resultant secondary biliary cirrhosis and hepatic failure
• increased incidence of cholangiocarcinoma (10-15%): difficult to diagnose and treat

Treatment
• image bile duct (MRCP) at least annually for early detection of cholangiocarcinoma (controversial)
• endoscopic sphincterotomy, biliary stent in selected cases of dominant CBD stricture
• antibiotics for cholangitis
• suppurative cholangitis requires emergency drainage of pus in CBD
• liver transplantation appears to be the best treatment for advanced sclerosing cholangitis (nearly 90% 1-yr survival; mean follow-up from time of diagnosis to need for transplant is 10 yr)
• ursodiol: previously recommended, but studies suggest that at least in high doses it increases mortality

Prognosis
• unfavourable regardless of treatment
• mean survival after diagnosis remains 4-10 yr

Primary Biliary Cirrhosis

Definition
• chronic inflammation and fibrous obliteration of intrahepatic bile ductules

Etiology/Epidemiology
• likely autoimmune (associated with Sjögren's syndrome, scleroderma, CREST syndrome, RA, thyroiditis)
• affects mainly middle-aged women (M:F = 1:9)

Signs and Symptoms
• often asymptomatic
• initial symptoms: pruritus, fatigue
• chronic: jaundice and melanosis (darkening skin) and other signs of cholestasis
• end-stage: hepatocellular failure, portal HTN, ascites
• high incidence of osteoporosis

Investigations
• increased ALP, GGT; bilirubin rises in later stage
• positive anti-mitochondrial antibodies (AMA; 95% specificity and sensitivity)
• increased serum cholesterol (mild increase in LDL, larger increase in HDL)
  ▪ may have: xanthelasmas, xanthomas
• liver biopsy confirms diagnosis and stages severity
• normal bile duct on MRCP rules out bile duct obstruction which can mimic PBC
• recently described "overlap" syndromes with autoimmune cholangitis, autoimmune hepatitis, sclerosing cholangitis
**Treatment**
- treat with ursodiol (less frequently colchicine, methotrexate)
- cholestyramine (for pruritus and hypercholesterolemia)
- calcium and vitamin D for low bone density; bisphosphonates if osteoporosis severe
- monitor for thyroid disease
- liver transplant if disease severe, progressive

**Prognosis**
- can be fatal, although not all asymptomatic patients show progression

**Table 20. Primary Sclerosing Cholangitis vs. Primary Biliary Cirrhosis**

**Secondary Biliary Cirrhosis**

**Definition**
- cirrhosis from prolonged partial or total obstruction of major bile ducts

**Etiology**
- acquired: post-operative strictures, chronic pancreatitis, sclerosing cholangitis, stone in bile duct
- congenital: CF, congenital biliary atresia, choledochal cysts

**Investigations**
- cholangiography and liver biopsy

**Treatment**
- treat obstruction, give antibiotics for cholangitis prophylaxis

**Biliary Colic, Cholecystitis**
- see **General Surgery**, GS48

**Ascending Cholangitis**
- see **General Surgery**, GS50

**Definition**
- infection of the biliary tree

**Etiology**
- stasis in the biliary tract due to obstruction or stricture (usually from previous cholecystectomy)
- infection originates in the duodenum or spreads hematogenously from the portal vein
- bacteria
  - *E. coli*, Klebsiella, Enterobacter, Enterococcus
  - co-infection with Bacteroides and Clostridia can occur

**Signs and Symptoms**
- Charcot’s triad: fever, RUQ pain, jaundice (50-70%)
- Reynolds Pentad in patients with suppurative cholangitis: fever, RUQ pain, jaundice, hypotension, altered mental status

**Investigations**
- increased WBC
- usually increased ALP and bilirubin, ALT variably elevated
- blood culture
- abdominal U/S: CBD dilation, stones
Treatment
- most important is drainage, ideally via ERCP, but if necessary by percutaneous biliary or surgical routes
- antibiotic therapy: broad spectrum to cover Gram-negatives, *Enterococcus*, and anaerobes (especially if CBD manipulation); no clear consensus on antibiotic choice but consider:
  - ampicillin + sulbactam or piperacillin/tazobactam
  - metronidazole + 3rd generation cephalosporin (e.g. ceftiraxone) or fluoroquinolone (e.g. ciprofloxacin or levofloxacin)
  - carbapenem monotherapy (e.g. imipenem or meropenem)

Prognosis
- good with effective drainage and antibiotics in mild to moderate cases
- high mortality (~50%) in patients with Reynolds Pentad

Pancreas

Pancreatic Enzyme Abnormalities

Causes of Increased Serum Amylase
- pancreatic disease
  - pancreatitis, pancreatic duct obstruction (e.g. ampullary cancer), pseudocyst, abscess, ascites, trauma, cancer
- non-pancreatic abdominal disease
  - biliary tract disease, bowel obstruction/ischemia, perforated or penetrating ulcer, ruptured ectopic pregnancy, aneurysm, chronic liver disease, peritonitis
- non-abdominal disease
  - cancer (lung, ovary, esophagus, etc.), salivary gland lesions, bulimia, renal transplant/insufficiency, burns, ketoacidosis
  - macroamylasemia

Causes of Increased Serum Lipase
- pancreatic disease: same as above
- non-pancreatic abdominal disease (mild elevations only): same as above
- non-abdominal disease
  - macrolipasemia
  - renal failure

Acute Pancreatitis

Etiology
Idiopathic: thought to be hypertensive sphincter or microlithiasis
Gallstones (45%)
Ethanol (35%)
Tumours: pancreas, ampulla, choledochocoele
Scorpion stings
Microbiological
  - bacterial: *Mycoplasma, Campylobacter, TB, M. avium intracellulare*, Legionella, leptospirosis
  - viral: mumps, rubella, varicella, viral hepatitis, CMV, EBV, HIV, Coxsackie virus, echovirus, adenovirus
  - parasites: ascariasis, clonorchiasis, echinococcosis
Autoimmune: SLE, polyarteritis nodosa (PAN), Crohn's disease
Surgery/trauma
  - manipulation of sphincter of Oddi (e.g. ERCP), post-cardiac surgery, blunt trauma to abdomen, penetrating peptic ulcer
Hyperlipidemia (TG >11.3 mmol/L; >1000 mg/dL), Hypercalcemia, Hypothermia
Emboli or ischemia
Drugs/toxins
  - azathioprine, mercaptopurine, furosemide, estrogens, methyl dopa, H2-blockers, valproic acid, antibiotics, acetaminophen, salicylates, methanol, organophosphates, steroids (controversial)

Pathophysiology
- activation of proteolytic enzymes within pancreatic cells, starting with trypsin, leading to local and systemic inflammatory response
- in gallstone pancreatitis, this is due to mechanical obstruction of the pancreatic duct by stones
• in ethanol-related pancreatitis, pathogenesis is unknown
• in rare genetic diseases, mutations prevent the physiological breakdown of trypsin required normally to stop proteolysis (e.g. mutant trypsin in hereditary pancreatitis or mutation in SPINK 1 gene which normally inhibits activated trypsin); may be model for ethanol-related pancreatitis

Pathology
• mild (interstitial)
  ▪ peri-pancreatic fat necrosis
  ▪ interstitial edema
• severe (necrotic)
  ▪ extensive peri-pancreatic and intra-pancreatic fat necrosis
  ▪ parenchymal necrosis and hemorrhage → infection in 60%
  ▪ release of toxic factors into systemic circulation and peritoneal space (causes multi-organ failure)
  ▪ severity of clinical features may not always correlate with pathology
  ▪ 3 phases
    ▪ local inflammation + necrosis → hypovolemia
    ▪ systemic inflammation in multiple organs, especially in lungs, usually after IV fluids given → pulmonary edema
    ▪ local complications 2 wk after presentation → pancreatic sepsis/abscess

Signs and Symptoms
• pain: epigastric, noncolicky, constant
• can radiate to back
• may improve when leaning forward
  (Ingelfinger’s sign)
• tender rigid abdomen; guarding
• N/V
• abdominal distention from paralytic ileus
• fever: chemical, not due to infection
• jaundice: compression or obstruction of bile duct
• Cullen’s/Grey-Turner’s signs
• tetany: transient hypocalcemia
• hypovolemic shock: can lead to renal failure
• acute respiratory distress syndrome
• coma

Investigations
• increased serum pancreatic enzymes: amylase, lipase (more specific)
• ALT >150 specific for biliary cause
• increased WBC, glucose, low calcium
• imaging: CT most useful for diagnosis and prognosis
  ▪ x-ray: “sentinel loop” (dilated proximal jejenum), calcification, and “colon cut-off sign” (colonic spasm)
  ▪ U/S: useful for evaluating biliary tree (67% sensitivity, 100% specificity)
  ▪ CT scan with IV contrast: useful for diagnosis and prognosis because contrast seen only in viable pancreatic tissue, non-viable areas can be biopsied percutaneously to differentiate sterile from infected necrosis
  ▪ ERCP or MRCP if cause uncertain, assess for duct stone, pancreatic or ampullary tumour, pancreas divisum

Classification
• interstitial edematous vs. necrotizing
• mild, moderate, severe

Prognosis
• usually a benign, self-limiting course, single or recurrent
• occasionally severe leading to
  ▪ shock
  ▪ pulmonary edema
  ▪ multi-organ dysfunction syndrome
  ▪ GI ulceration due to stress
  ▪ death
• numerous scales to describe severity: probably most useful is proportion of pancreas not taking up contrast on CT done 48 hours after presentation (necrotic pancreas does not take up the contrast dye)
• presence of organ failure, particularly organ failure that persists > 48 hours, is associated with worse outcomes

All of these collections are classified as infected or not infected

G45 Gastroenterology Pancreas
Toronto Notes 2016
Treatment
• goals (only supportive therapy available)
  1. hemodynamic stability
  2. analgesia
  3. oxygen
  4. stop progression of damage (difficult)
  5. treat local and systemic complications
• antibiotics controversial except in documented infection (use cephalosporins, imipenem)
• aspirate necrotic areas of pancreas to diagnose infection; drain if infected
• IV fluids (crystalloid or colloid)
  • beware third spacing of fluid, monitor urine output carefully
• NG suction (lets pancreas rest) if vomiting, stomach very dilated
• endoscopic sphincterotomy if severe gallstone pancreatitis (i.e. cholangitis or ongoing obstruction)
• nutritional support: nasojejunal feeding tube or TPN if cannot tolerate enteric feeds
  • recent evidence supports nasogastric enteral (or oral if feasible) feeds
• no benefit: glucagon, atropine, aprotinin, H2-blockers, peritoneal lavage
• follow clinically and CT/ultrasound to exclude complications
• chief role of surgery is to excise necrotic tissue (necrosectomy) in the case of infected pancreatic necrosis (try to delay for >2 wk to allow demarcation between viable and necrotic tissue)

Late Complications
• pseudocysts: follow if asymptomatic, drain if symptomatic or growing
  • drain: choice of endoscopic, percutaneous under radiological guidance, or surgical
• infected necrosis/abcesses: antibiotics + percutaneous drainage, endoscopic vs. surgical
• bleeding: (1) gastric varices if splenic vein thrombosis, (2) pseudoaneurysm of vessels in areas of necrosis, especially splenic artery, (3) duodenal ulcer related to compression of duodenum by enlarged pancreas
• splenic and portal vein thrombosis: no effective therapy described, anticoagulation not proven, hazardous
• rare: DM, pancreatic duct damage

Chronic Pancreatitis

Definition
• irreversible damage to pancreas characterized by
  1. pancreatic cell loss (from necrosis)
  2. inflammation
  3. fibrosis

Etiology/Pathophysiology
• alcohol (most common)
  • causes a larger proportion (>90%) of chronic pancreatitis than acute pancreatitis
  • changes composition of pancreatic juice (e.g. increases viscosity)
  • decreases pancreatic secretion of pancreatic stone protein (lithostathine) which normally solubilizes calcium salts
  • precipitation of calcium within pancreatic duct results in duct and gland destruction
  • toxic effect on acinar and duct cells – directly or via increasing free radicals
  • acinar cell injury leads to cytokine release, which stimulates pancreatic stellate cells to form collagen (leading to fibrosis)
  • varying degrees of ductular dilatation, strictures, protein plugs, calcification
• no satisfactory theory to explain why only a minority of alcoholics develop pancreatitis
• unusual causes
  • CF
  • severe protein-calorie malnutrition
  • hereditary
  • idiopathic

Signs and Symptoms
• early stages
  • recurrent attacks of severe abdominal pain (upper abdomen and back)
  • chronic painless pancreatitis: 10%
• late stages: occurs in 15% of patients
  • malabsorption syndrome when >90% of function is lost, steatorrhea
  • diabetes, calcification, jaundice, weight loss, pseudocyst, ascites, GI bleed
**Investigations**
- laboratory
  - increase in serum glucose
  - increase in serum ALP, less commonly bilirubin (jaundice)
  - serum amylase and lipase usually normal
- AXR: pancreatic calcifications
- U/S or CT: calcification, dilated pancreatic ducts, pseudocyst
- MRCP or ERCP: abnormalities of pancreatic ducts-narrowing and dilatation
- EUS: abnormalities of pancreatic parenchyma and pancreatic ducts, most sensitive test
- 72-h fecal fat test: measures exocrine function
- secretin test: gold standard, measures exocrine function but difficult to perform, unpleasant for patient, expensive
- fecal pancreatic enzyme measurement (elastase-1, chymotrypsin): available only in selected centres

**Treatment**
- most common problem is pain, difficult to control
- general management
  - total abstinence from alcohol
  - enzyme replacement may help pain by resting pancreas via negative feedback
  - analgesics
  - celiac ganglion blocks
  - time: pain decreases with time as pancreas "burns out"
- endoscopy: sphincterotomy, stent if duct dilated, remove stones from pancreatic duct
- surgery: drain pancreatic duct (pancreaticojejunostomy) if duct dilated (more effective than endoscopy); resect pancreas if duct contracted
- steatorrhea
  - pancreatic enzyme replacement
  - restrict fat, increase carbohydrate and protein (may also decrease pain)
  - neither endoscopy nor surgery can improve pancreatic function

**Autoimmune Pancreatitis**
- most commonly presents as a mimicker of pancreatic cancer (pancreatic mass detected because of jaundice ± abdominal pain)

**Investigations**
- histology: lymphocyte and plasma cell infiltration of pancreas
- imaging: focal or diffuse enlargement of pancreas on CT or MRI, sausage shaped, low density rim around pancreas
- serology: increased serum IgG4
- other organ involvement: sialadenitis, retroperitoneal fibrosis, biliary duct narrowing, nephritis

**Treatment**
- responds to prednisone

---

**Clinical Nutrition**

**Determination of Nutritional Status**
- corrected weight loss (expressed as body mass index [kg/m²]) is most important parameter in assessing need for nutritional support
- Subjective Global Assessment: simple bedside tool to assess nutritional status, to help identify those who will benefit from nutritional support

**Investigations**
- plasma proteins: albumin, pre-albumin (shorter half life than albumin), transferrin
  - decrease may indicate decreased nutritional status or disease state
- thyroid-binding globulin, retinol-binding protein (may be too sensitive)
- anthropometry (e.g. triceps skinfold thickness), grip strength less often used

**Table 22. Areas of Absorption of Nutrients**

Enteral Nutrition

Definition
- enteral nutrition (tube feeding) is a way of providing food through a tube placed in the stomach or the small intestine
- choice of tubes: nasogastric (NG), nasojejunal (NJ), percutaneous endoscopic gastrostomy (“G-tube” or “PEG tube”), percutaneous endoscopic jejunostomy (“J-tube”) or tubes can be placed radiologically, surgically

Indications
- oral feeding inadequate or contraindicated

Feeds
- polymeric feeds contain whole protein, carbohydrate, fat as a liquid, with or without fibre
- elemental feeds contain protein as amino acids, carbohydrate as simple sugars, fat content low (therefore high osmolarity)
- specific diets: low carbohydrate/high fat solution for ventilated patients (carbohydrate has a high respiratory quotient so minimizes carbon dioxide production), high energy, low electrolyte solutions for dialysis patients

Relative Contraindications
- non-functioning gut (e.g. intestinal obstruction, enteroenteral or entero-cutaneous fistulae)
- uncontrolled diarrhea
- GI bleeding

Complications
- aspiration
- diarrhea
- refeeding syndrome (rare): carbohydrate can stimulate excessive insulin release, leading to cellular uptake and low serum levels of phosphate, magnesium, potassium
- overfeeding syndrome (rare): hypertonic dehydration, hyperglycemia, hypercapnea, azotemia (from excess protein)

Enteral Nutrition Advantages over Parenteral Nutrition
- fewer serious complications (especially sepsis)
- nutritional requirements for enterally administered nutrition better understood
- can supply gut-specific fuels such as glutamine and short chain fatty acids
- nutrients in the intestinal lumen prevent atrophy of the gut and pancreas
- prevents gallstones by stimulating gallbladder motility
- much less expensive

Parenteral Nutrition

Definition
- parenteral nutrition (PN) is the practice of feeding a person intravenously, bypassing the usual process of eating and digestion

Indications
- short-term (<1 mo)
  - whenever GI tract not functioning
  - only situations where PN has been well shown to increase survival are after bone marrow transplant and in short bowel syndrome, some evidence for benefit in gastric cancer, but often used in ICU, perioperatively, and in difficult to control sepsis
  - pre-operative: only useful in severely malnourished (e.g. loss of >15% of pre-morbid weight, serum albumin <28 g/L or <2.8 g/dL), and only if given for ≥2 wk
  - renal failure: PN shown to increase rate of recovery; no increase in survival
  - liver disease: branched chain amino acids may shorten duration of encephalopathy; no increase in survival
  - IBD: PN closes fistulae and heals acute exacerbations of mucosal inflammation, but effect is transient (EN is equally effective)
  - some evidence for efficacy, but convincing data not available for
    - radiation/chemotherapy-induced enteritis
    - AIDS with wasting diarrhea
  - severe acute pancreatitis
- long-term (>1 mo): can be given at home
  - severe untreatable small bowel disease (e.g. radiation enteritis, extensive CD, high output fistulae)
  - following surgical resection of >70% of small bowel (e.g. small bowel infarction)
  - severe motility diseases (e.g. scleroderma affecting bowel)

Whenever possible, enteral nutrition is ALWAYS preferable over parenteral nutrition
Relative Contraindications
- functional GI tract for enteral nutrition
- active infection; at least until appropriate antibiotic coverage
- inadequate venous access; triple-lumen central venous lines usually prevent this problem
- unreliable patient or clinical setting

Complications of PN
- sepsis: most serious of the common complications
- mechanical pneumothorax from insertion of central line, catheter migration and thrombosis, air embolus
- metabolic: CHF, hyperglycemia, gallstones, cholestasis

<td>Inflliximab, azathioprine, or combination</td>
<td>NEJM 2010; 362:1383-95</td>
<td>In moderate-severe Crohn’s disease, infliximab + azathioprine was more likely to result in corticosteroid-free remission than infliximab monotherapy. Infliximab monotherapy was more effective than azathioprine monotherapy. Similar results have been reported for ulcerative colitis (Gastroenterology 2014; 146:392-400)</td>
</tr>
<tr>
<td>Enteral versus parenteral</td>
<td>Cochrane Database Syst Rev 2010;1</td>
<td>For acute pancreatitis, no trial was convincing alone, but in the congregate, enteral feeds via nasogastric tube is preferable to either no feeding or parenteral nutrition</td>
</tr>
<tr>
<td>Rifaximin treatment in hepatic encephalopathy</td>
<td>NEJM 2010; 362:1071-81</td>
<td>The most convincing of several articles establishing this non-absorbable antibiotic as the treatment of choice for hepatic encephalopathy for maintaining remission from hepatic encephalopathy and reducing hospitalization associated with the disease</td>
</tr>
<tr>
<td>Adenoma detection rate and risk of colorectal cancer and death</td>
<td>NEJM 2014; 370:1298-1306</td>
<td>A high miss rate for colorectal cancers has been suggested, chiefly in the right colon. This study demonstrates a method of assessing the competence of endoscopists in detecting cancers using adenoma detection rate (the proportion of colonoscopic exams in which a physician detects one or more adenomas) as a surrogate marker. Adenoma detection rate was associated with lower risk of interval colorectal cancer and has launched quality assurance programs for screening colonoscopies</td>
</tr>
<tr>
<td>Prednisolone or pentoxifylline for alcoholic hepatitis</td>
<td>NEJM 2015; 372:1619-28</td>
<td>For alcoholic hepatitis, prednisolone improved survival when the Maddrey’s discriminant function &gt; 32, but the benefit did not reach statistical significance and pentoxifylline was of no advantage at all. Other studies had shown some benefit with pentoxifylline, but this study was the most definitive</td>

Basic Anatomy Review

Figure 1. Abdominal incisions

Lateral Abdominal Wall Layers and their Continuous Spermatic and Scrotal Structures (superficial to deep)
1. skin (epidermis, dermis, subcutaneous fat)
2. superficial fascia
   - Camper's fascia (fatty) → Dartos fascia
   - Scarpa's fascia (membranous) → Colles' superficial perineal fascia
3. muscle (see Figure 2 and Figure 3)
   - external oblique → inguinal ligament → external spermatic fascia and spermatic cord
   - internal oblique → cremasteric muscle/fascia
   - transversus abdominis → posterior inguinal wall
4. transversalis fascia → internal spermatic fascia
5. preperitoneal fat
6. peritoneum → tunica vaginalis

Midline Abdominal Wall Layers (superficial to deep)
1. skin
2. superficial fascia
3. rectus abdominis muscle: in rectus sheath, divided by linea alba
   - anterior rectus sheath = external oblique aponeurosis and anterior leaf of internal oblique aponeurosis
   - posterior rectus sheath = posterior leaf of internal oblique aponeurosis and transversus abdominis aponeurosis
   - below arcuate line
   - aponeuroses of external oblique, internal oblique, transversus abdominis all pass in front of rectus abdominis
4. arteries: superior epigastric (branch of internal thoracic), inferior epigastric (branch of external iliac); both arteries anastomose and lie behind the rectus muscle (superficial to posterior rectus sheath above arcuate line)
5. transversalis fascia
6. peritoneum

Figure 2. Continuity of the abdominal wall with layers of the scrotum and spermatic cord
Figure 3. Midline cross-section of abdominal wall

Figure 4. Blood supply to the GI tract

Venous Flow

Figure 5. Venous drainage of the GI tract

Celiac trunk (1)
   i) Common hepatic artery (2)
      • Hepatic proper (3)
         – Left hepatic artery (4)
         – Right hepatic artery (5)
      • Right gastric artery (7)
   ii) Left gastric artery (6)
   iii) Splenic artery (9)

Superior mesenteric artery (10)
   i) Right colic artery (12)
   ii) Middle colic artery (11)
   iii) Ileocolic artery (13)
   iv) Ileal and jejunal branches (14)

Inferior mesenteric artery (15)
   i) Left colic artery (16)
   ii) Sigmoid arteries (17)
   iii) Superior rectal artery (18)

Porto-systemic anastomoses:
1. Esophageal branches of left gastric vein with esophageal veins
2. Paraumbilical veins with subcutaneous veins of anterior abdominal wall
3. Superior rectal vein with middle and inferior rectal veins

Differential Diagnoses of Common Presentations

Acute Abdominal Pain

- acute abdomen = severe abdominal pain of acute onset and requires urgent medical attention
- in patients with acute abdominal pain, the first diagnoses that you should consider are those requiring potential urgent surgical intervention
- two main patterns constituting urgent general surgery referrals are peritonitis and obstruction

<table>
<thead>
<tr>

DIFFUSE

Gastrointestinal
- Peritonitis
- Early appendicitis, perforated appendicitis
- Mesenteric ischemia
- Crohn’s disease
- Gastroenteritis/colitis
- Constipation
- Bowel obstruction
- Pancreatitis
- Inflammatory bowel disease
- Irritable bowel syndrome
- Ogilvie’s syndrome

Cardiovascular/Hematological
- Acute dissection/ruptured AAA
- Sickle cell crisis

Genitourinary/Gynecological
- Perforated ectopic pregnancy
- PID
- Acute urinary retention

Endocrinological
- Carcinoid syndrome
- Diabetic ketoacidosis
- Addisonian crisis
- Hypercalcaemia

Other
- Lead poisoning
- Tertiary syphils

SUPRAPUBIC

Gastrointestinal (see RLQ/LUQ)
- Acute appendicitis
- IBD

Gynecological
- Ecstatic pregnancy
- PID

Endometriosis
- Threatened/incomplete abortion
- Hydrosalpinx/salpingitis
- Ovarian torsion
- Hemorrhagic fibroid
- Tubo-ovarian abscess

Genitourinary
- Cystitis (infectious, hemorrhagic)
- Hydroureter/urinary colic
- Epididymitis
- Testicular torsion
- Acute urinary retention

Extraperitoneal
- Rectus sheath hematoma

In all patients presenting with an acute abdomen, order the following:

**KEY TESTS FOR SPECIFIC DIAGNOSIS**
- ALP, ALT, AST, bilirubin
- Amylase/lipase
- Urinalysis
- β-HCG (in women of childbearing age)
- Troponins
- Lactate

**KEY TESTS FOR OR PREPARATION**
- CBC, electrolytes, BUN, creatinine, glucose
- CXR + ECG
- INR/PTT

Types of Peritonitis
- Primary peritonitis: spontaneous without clear etiology
- Secondary peritonitis: due to a perforated viscus
- Tertiary peritonitis: recurrent secondary peritonitis more often with resistant organisms

Localization of Pain
Most digestive tract pain is perceived in the midline because of bilaterally symmetric innervation; kidney, ureter, ovary, or somatically innervated structures are more likely to cause lateralized pain

Referred Pain
- Biliary colic: to right shoulder or scapula
- Renal colic: to groin
- Appendicitis: periumbilical to right lower quadrant (RLQ)
- Pancreatitis: to back
- Ruptured aortic aneurysm: to back or flank
- Perforated ulcer: to RLQ (right paracolic gutter)
- Hip pain: to groin

Most Common Presentations of Surgical Pain
- Sudden onset with rigid abdomen = perforated viscus
- Pain out of proportion to physical findings = ischemic bowel
- Vague pain that subsequently localizes = appendicitis or other intra-abdominal process that irritates the parietal peritoneum
- Waves of colicky pain = bowel obstruction
## Abdominal Mass

### Table 2. Differential Diagnosis of Abdominal Mass

</table>

## Gastrointestinal Bleeding

- see Gastroenterology, G25, G27

### Indications for Surgery

- failure of medical management
- exsanguinating hemorrhage: hemodynamic instability despite vigorous resuscitation
- recurrent hemorrhage after initial stabilization procedures with up to two attempts of endoscopic hemostasis
- hypovolemic shock
- prolonged bleeding with transfusion requirement >3 units
- bleeding at rate >1 unit/8 h

### Surgical Management of GI Bleeding

- **UGIB**
  - bleeding from a source proximal to the ligament of Treitz
  - often presents with hematemesis and melena unless very brisk (then can present with hematochezia, hypotension, tachycardia)
  - initial management with endoscopy; if fails, then consider surgery
  - note: PUD accounts for approximately 55% of severe UGIB
- **LGIB**
  - bleeding from a source distal to the ligament of Treitz
  - often presents with BRBPR unless proximal to transverse colon
  - may occasionally present with melena
  - initial management with colonoscopy to detect and potentially stop source of bleeding
  - 75% of patients will spontaneously stop bleeding, however if bleeding continues barium enema should NOT be performed
  - angiography, RBC scan to determine source as indicated
  - surgery indicated if bleeding is persistent - aimed at removing underlying cause of bleeding
  - obscure bleed may require blind total colectomy if the source is not found

### Table 3. Differential Diagnosis of GI Bleeding

<tr>
<td></td>
<td>Gastric cancer*</td>
</tr>
<tr>
<td></td>
<td>Duodenal cancer*</td>
</tr>
</tbody>
</table>

Pancreatitis can look like a surgical abdomen, but is rarely an indication for immediate laparotomy

### Indications for Urgent Operation

- Overt bleeding: obvious hematochezia or melena per rectum visible to naked eye
- Occult bleeding: bleeding per rectum is not obvious to naked eye (e.g. positive guaiac test)
- Obstructed bleeding: overt bleeding with no identifiable source after colonoscopy and endoscopy

### Transfusion Strategies for Acute Upper Gastrointestinal Bleeding

NEJM 2013;368:11-21

Recent study by Villanueva et al., demonstrates that a restrictive transfusion strategy (transfusion with hemoglobin below 70 g/L) significantly improves outcomes in patients with acute UGIB, compared to a liberal transfusion strategy (transfusion with hemoglobin below 90 g/L). Refer to study for details.

*Managed surgically in most cases

**Jaundice**

- see Gastroenterology, G40

**Pre-Operative Preparations**

**Considerations**

- informed consent (see Ethical, Legal, and Organizational Medicine, ELOAM7?)
- screening questionnaire to determine risk factors e.g. age, exercise capacity, medication use, allergies
- consider pre-operative anesthesia, medicine consult as indicated to optimize patient status
- NPO according to guidelines (see Anesthesia and Perioperative Medicine, A5)
- IV – balanced crystalloid at maintenance rate (4:2:1 rule → roughly 100-125 cc/h): normal saline or Ringer’s lactate; bolus to catch up on estimated losses including losses from bowel prep
  - appropriate use of fluids perioperatively decreases risk of cardiorespiratory complications
- patient’s regular medications including with the exception of hypoglycemic agents, diuretics and ACE-inhibitors
- prednisone will require stress dose coverage, anticoagulation medication must be managed to decrease surgical bleeding but not put patient at risk for increased thrombotic events (e.g. switching from warfarin to LMWH)
- hold ASA x 1 wk pre-operative
- prophylactic antibiotics depending on wound class (within 1 h prior to incision): usually cefazolin (Ancef®) ± metronidazole (Flagyl®)
- consider bowel prep: cleans out bowel and decreases bacterial population
  - oral cathartic (e.g. fleet Phosphosoda®) starting previous day
  - in selected cases, current evidence does not support routine use
- consider DVT prophylaxis for all inpatient surgery (heparin)
- do not hold heparin prior to surgery unless epidural is expected
- smoking cessation x 8 or more wk and weight loss pre-operative can significantly decrease post-operative complications
- infection: delay elective surgery until infection controlled including respiratory infection particularly in asthma patients

**Investigations**

- see Anesthesia and Perioperative Medicine, A3
- routine pre-operative laboratory investigations for elective procedures should be selective
  - only ASA class and surgical risk have been found to independently predict post-operative adverse effects
- blood components: group and screen or cross and type depending on procedure
- CBC, electrolytes, BUN, creatinine
- INR/PT, PTT
- ABGs if predisposed to respiratory insufficiency
- ECG (PA and lateral) for patients with history of cardiac or pulmonary disease
- ECG as indicated by history or if >69 yr and no risk factors
- β-hCG testing in all women of reproductive age

**Biochemical Signs for Differentiating Jaundice**

- Hepatocellular: Elevated bilirubin + elevated ALT/AST
- Cholestatic: Elevated bilirubin + elevated ALP/GGT ± duct dilatation upon biliary U/S
- Hemolysis:↓ haptoglobin ↑ LDH

**Note:** cholestatic jaundice is usually surgical

**Bilirubin Levels**

<table>

In patients with liver disease and an acute abdomen, spontaneous bacterial peritonitis must be ruled out

**Best Practice in General Surgery (BPIGS)**

http://www.bpigs.ca/

BPIGS is a University of Toronto initiative with the goal of standardizing care in general surgery. This link contains EBM based guidelines which have been implemented by consensus within all Toronto teaching hospitals. This is a highly recommended source for the most up-to-date pre-operative and general treatment guidelines

**Surgical Emergencies: Take an AMPLE History**

- Allergies
- Medications
- Past medical/surgical history (including anesthesia and bleeding disorders)
- Last meal
- Events (HPI and FHx of bleeding disorders/anesthesia complications)
Drains
• NGT
  • indications: gastric decompression, analysis of gastric contents, irrigation/dilution of gastric contents, feeding (only if necessary due to risk of aspiration → naso-jejunal tube preferable)
  • contraindications: suspected basal skull fracture, obstruction of nasal passages due to trauma
• Foley catheter with urometer
  • indications: to accurately monitor urine output, decompression of bladder, relieve obstruction, rapidly expanding suprapubic mass
  • contraindications: suspected urethral injury, difficult insertion of catheter

Surgical Complications

• general principles in preventing complications during the post-operative period include
  • frequent examination of the patient (daily or more) and their wound
  • removal of surgical tubes as soon as possible (e.g. Foley catheters and surgical drains)
  • early ambulation
  • monitor fluid balance and electrolytes
  • analgesia - enough to adequately address pain, but not excessive
  • skillful nursing care

Post-Operative Fever

• fever does not necessarily imply infection particularly in the first 24-48 h post-operative
• fever may not be present or is blunted if patient is receiving chemotherapy, glucocorticoids, or immunosuppression
• timing of fever may help identify cause
  • hours after surgery – POD #1 (immediate)
    • inflammatory reaction in response to trauma from surgery; unlikely to be infectious
    • reaction to blood products received during surgery
    • malignant hyperthermia
  • POD #1-2 (acute)
    • atelectasis (most common cause of fever on POD #1)
    • early wound infection (especially *Clostridium*, Group A *Streptococcus* – feel for crepitus and look for “dishwater” drainage)
    • aspiration pneumonitis
    • other: Addisonian crisis, thyroid storm, transfusion reaction
  • POD #3-7 (subacute): likely infectious
    • UTI, surgical site infection, IV site/line infection, septic thrombophlebitis, leakage at bowel anastomosis (tachycardia, hypotension, oliguria, abdominal pain)
  • POD #8+ (delayed)
    • intra-abdominal abscess, DVT/PE (can be anytime post-operative, most commonly POD #8-10), drug fever
    • other: cholecystitis, peri-rectal abscess, URTI, infected seroma/biloma/hematoma, parotitis, *C. difficile* colitis, endocarditis

Treatment
• treat primary cause
• antipyrexia (e.g. acetaminophen)

Wound/Incisional Complications

WOUND CARE (see Plastic Surgery, PL8)
• can shower POD #2-3 after epithelialization of wound
• dressings can be removed POD #2 and left uncovered if dry
• examine wound if wet dressing, signs of infection (fever, tachycardia, pain)
• skin sutures and staples can be removed POD #7-10
  • exceptions: incision crosses crease (groin), closed under tension, in extremities (hand) or patient factors (elderly, corticosteroid use, immunosuppressed) removed POD #14, earlier if signs of infection
• negative pressure dressings consist of foam and suction, promote granulation
  • ideal for large (grafted sites) or non-healing wounds (irradiated skin, ulcer)

DRAINS
• sometimes placed intra-operatively to prevent fluid accumulation (blood, pus, serum, bile, urine)
  • can be used to assess quantity of third space fluid accumulation post-operatively
• potential route of infection, bring out through separate incision (vs. operative wound) to decrease risk of wound infection and remove as soon as possible

Drain Size
Measured by the unit French:
French = diameter (mm) x 3
• **types of drains**
  - open (e.g. Penrose), higher risk of infection
  - closed: 1) Gravity drainage (e.g. Foley catheter); 2) Underwater-seal drainage system (e.g. chest tube); 3) Suction drainage (e.g. Jackson-Pratt)
  - sump (e.g. NGT)

• monitor drain outputs daily

• drains should be removed once drainage is minimal (usually <30-50 cc/24 h)

• evidence does not support routine post-operative drainage of abdominal cavity

• drains do not guarantee that the patient will not form a collection of fluid

• ridged drains can erode through internal structures, and excessive suction can cause necrosis

### SURGICAL SITE INFECTION

#### Etiology

- *S. aureus*, *E. coli*, *Enterococcus*, *Streptococcus* spp., *Clostridium* spp.

#### Risk Factors

**Table 4. Procedures and Their Impact on Surgical Site Infection**

<table>

</table>

- patient characteristics
  - age, DM, steroids, immunosuppression, obesity, burn, malnutrition, patient with other infections, traumatic wound, radiation, chemotherapy
- other factors
  - prolonged pre-operative hospitalization, reduced blood flow, break in sterile technique, multiple antibiotics, hematoma, seroma, foreign bodies (drains, sutures, grafts), skin preparation, hypoxemia, hypothermia

#### Clinical Presentation

- typically fever POD #5-8 (*Streptococcus* and *Clostridium* can present in 24 h)
- pain, blanchable wound erythema, induration, purulent discharge, warmth
- complications: fistula, sinus tracts, sepsis, abscess, suppressed wound healing, superinfection, spreading infection to myonecrosis or fascial necrosis (necrotizing fasciitis), wound dehiscence, evisceration, hernia

#### Prophylaxis

- used to reduce the chance of surgical site infections
- pre-operative antibiotics for most surgeries (cefazolin ± metronidazole or if β-lactam allergy, clindamycin ± gentamycin)
  - within 1 h pre-incision; can re-dose at 1-2 half-lives (~q4-8h) in the OR
  - not required for low risk elective cholecystectomy, hemorrhoidectomy, fistulotomy, sphincterotomy for fissure
  - evidence suggests role in breast surgery
- generally no need to continue prophylactic antibiotics post-operatively
  - reserve post-operative antibiotics for treatment of suspected or documented intra-abdominal infection
- normothermia (maintain patient temperature 36-38°C during OR)
- hyperoxygenation (consider FiO₂ of 80% in OR)
- chlorhexidine-alcohol wash of surgical site
- hair removal should not be performed unless necessary; if so, clipping superior to shaving
- consider delayed primary closure of incision for contaminated wounds

#### Systemic Prophylactic Antibiotics Recommendations

Updated Recommendations for Control of Surgical Site Infections

*Ann Surg* 2011;253:1082-93

- Choice of routine prophylactic antibiotic depends on the pathogen and patient allergies.
- Vancomycin and fluoroquinolones should be administered 1-2 h prior to incision; all other antibiotics should be administered 30 min prior to incision.
- Short-acting antibiotics should be redosed ~3 h after incision.
- Antibiotic administration >24 h after surgery does not appear to add benefits.
- Antibiotics should no longer be routinely administered in three doses.
- The majority of antibiotics are renally excreted hence renal function must be considered in antibiotic administration.
- Obese patients need higher antibiotic doses to achieve therapeutic concentrations.
- Drug half-life and length of operation need to be considered in antibiotic administration.
Treatment
• examination of the wound: inspect, compress adjacent areas, swab drainage for C&S and Gram stain
• re-open affected part of incision, drain, pack, heal by secondary intention in most cases
• for deeper infections, debride necrotic and non-viable tissue
• antibiotics and demarcation of erythema only if cellulitis or immunodeficiency

WOUND HEMORRHAGE/HEMATOMA
• secondary to inadequate surgical control of hemostasis

Risk Factors
• anticoagulant therapy, coagulopathies, thrombocytopenia, DIC, severe liver disease, myeloproliferative disorders, severe arterial HTN, severe cough
• more common with transverse incisions through muscle, due to cutting of muscle

Clinical Features
• pain, swelling, discoloration of wound edges, leakage
• rapidly expanding neck hematoma can compromise airway and is a surgical emergency: consider having a suture kit at bedside in all neck surgery in the event of having to open the wound emergently

Treatment
• pressure dressing
• open drainage ± wound packing (large hematoma only)
• if significant bleeding, may need to re-operate to find source (often do not find a discrete vessel)

SEROMA
• fluid collection other than pus or blood
• secondary to transection of lymph vessels
• delays healing
• increased infection risk

Treatment
• consider pressure dressing ± needle drainage
• if significant may need to re-operate

WOUND DEHISCENCE
• disruption of fascial layer, abdominal contents contained by skin only
• 95% caused by intact suture tearing through fascia

Clinical Features
• typically POD #1-3; most common presentation sign is serosanguinous drainage from wound ± evisceration
• palpation of wound edge: should normally feel a “healing ridge” from abdominal wall closure (raised area of tissue under incision)

Risk Factors
• local: technical failure of closure, increased intra-abdominal pressure (e.g. COPD, ileus, bowel obstruction), hematoma, infection, poor blood supply, radiation, patient not fully paralyzed while closing, transverse incision
• systemic: smoking, malnutrition (hypoalbuminemia, vitamin C deficiency), connective tissue diseases, immunosuppression, pulmonary disease, ascites, poor nutrition, steroids, chemotherapy, obesity, other (e.g. age, sepsis, uremia)
• DM alone is not a risk factor

Treatment
• place moist dressing over wound with binder around abdomen and transfer to OR
• may consider conservative management with debridement of fascial and/or skin margins
• evisceration, also known as ‘burst abdomen’, is a surgical emergency (mortality rates as high as 45%): take patient for operative closure, use slowly absorbable suture ± retention sutures
Urinary and Renal Complications

URINARY RETENTION
• may occur after any operation with general anesthesia or spinal anesthesia
• more likely in older males with history of benign prostatic hyperplasia, patients on anticholinergics

Clinical Presentation
• abdominal discomfort, palpable bladder, overflow incontinence, post-void residual urine volume >100 mL

Treatment
• Foley catheter to rest bladder, then trial of voiding

OLIGURIA/ANURIA (see Nephrology, NP17)

Etiology
• prerenal vs. renal vs. postrenal
  • most common post-operative cause is prerenal ± ischemic ATN
  • external fluid loss: hemorrhage, dehydration, diarrhea
  • internal fluid loss: third-spacing due to bowel obstruction, pancreatitis

Clinical Presentation
• urine output <0.5 cc/kg/h, increasing Cr, increasing BUN

Treatment
• according to underlying cause; fluid deficit is treated with crystalloid (NS or RL)

Post-Operative Dyspnea

• see Respiratory Complications below and Cardiac Complications, GS11

Etiology
• respiratory: atelectasis, pneumonia, pulmonary embolus (PE), ARDS, asthma, pleural effusion
• cardiac: MI, arrhythmia, CHF
• inadequate pain control

Respiratory Complications

ATELECTASIS
• comprises 90% of post-operative pulmonary complications

Clinical Features
• low-grade fever on POD #1, tachycardia, crackles, decreased breath sounds, bronchial breathing, tachypnea

Risk Factors
• COPD, smoking, obesity, elderly persons
• upper abdominal/thoracic surgery, oversedation, significant post-operative pain, poor inspiratory effort

Treatment
• pre-operative prophylaxis
  • smoking cessation (best if >8 wk pre-operative)
• post-operative prophylaxis
  • incentive spirometry, deep breathing exercise, chest physiotherapy, intermittent positive-pressure breathing
  • selective NGT decompression after abdominal surgery
  • short-acting neuromuscular blocking agents
  • minimize use of respiratory depressive drug, good pain control, early ambulation

PNEUMONIA/PNEUMONITIS
• may be secondary to aspiration of gastric contents during anesthetic induction or extubation, causing a chemical pneumonitis

Risk Factors
• aspiration: general anesthetic, decreased LOC, GERD, full stomach, bowel/gastric outlet obstruction + non-functioning NGT, pregnancy, seizure disorder
• non-aspiration: atelectasis, immobility, pre-existing respiratory disease
Clinical Features
- productive cough, fever
- tachycardia, cyanosis, respiratory failure, decreased LOC
- CXR: pulmonary infiltrate

Treatment
- prophylaxis: see atelectasis prophylaxis, pre-operative NPO/NGT, rapid sequence anesthetic induction
- immediate removal of debris and fluid from airway
- consider endotracheal intubation and flexible bronchoscopic aspiration
- IV antibiotics to cover oral nosocomial aerobes and anaerobes (e.g. ceftiraxone, metronidazole)

PULMONARY EMBOLUS (see Respirology, R18)

Clinical Features
- unilateral leg swelling and pain (DVT as a source of PE), sudden onset shortness of breath, tachycardia, fever
- most commonly POD #8-10, but can occur anytime post-operatively
- diagnosis made by Chest CT scan usually

Treatment
- IV heparin, long-term warfarin (INR = 2-3) for 3 mo
- Greenfield (IVC) filter if contraindications to anticoagulation
- prophylaxis: subcutaneous heparin (5,000 U bid) or LMWH, compression stockings (TED’ Hose)

PULMONARY EDEMA

Etiology
- cardiogenic vs. noncardiogenic
- circulatory overload: excess volume replacement, LV failure, shift of fluid from peripheral to pulmonary vascular bed, negative airway pressure, alveolar injury due to toxins (e.g. ARDS)
  - more common with pre-existing cardiac disease
- negative pressure pulmonary edema due to inspiratory efforts against a closed glottis upon awakening from general anesthesia

Clinical Features
- shortness of breath, crackles at lung bases, CXR abnormal

Treatment (LMNOP)
- Lasix
- Morphine (decreases symptoms of dyspnea, venodilator and afterload reduction)
- Nitrates (venodilator)
- Oxygen + non-invasive ventilation
- Position (sit patient up)

RESPIRATORY FAILURE

Clinical Features
- dyspnea, cyanosis, evidence of obstructive lung disease
- earliest manifestations – tachypnea and hypoxemia (RR >25, pO2 <60)
- pulmonary edema, unexplained decrease in SaO2

Treatment
- ABCs, O2, ± intubation
- bronchodilators, diuretics to treat CHF
- adequate blood pressure to maintain pulmonary perfusion
- if these measures fail to keep PaO2 >60, consider ARDS

New onset “asthma” and wheezing in the elderly is cardiogenic until proven otherwise
Cardiac Complications

- abnormal ECGs common in post-operative period (compare to pre-operative ECG)
- common arrhythmias: supraventricular tachycardia, atrial fibrillation (secondary to fluid overload, PE, MI)

Myocardial Infarction

- see Cardiology and Cardiac Surgery, C26
- surgery increases risk of MI
- incidence
  - 0.5% in previously asymptomatic men >50 yr old
  - 40-fold increase in men >50 yr old with previous MI

Risk Factors

- pre-operative HTN, CHF
- previous MI (highest risk ≤6 mo, but risk never returns to baseline)
- increased age
- intra-operative hypotension
- operations >3 h
- angina

Clinical Features

- majority of cases on day of operation or POD #3-4 (shifting of third space fluid back into intravascular compartment)
- often silent without chest pain, may only present with new-onset CHF (dyspnea), arrhythmias, hypotension

Intra-Abdominal Abscess

Definition

- collection of pus walled-off from rest of peritoneal cavity by inflammatory adhesions and viscera

Etiology

- usually polymicrobial: Gram-negative bacteria, anaerobes
  - consider Gram-positives if coexisting cellulitis

Risk Factors

- emergency, contaminated OR
- GI surgery with anastomoses
- poor healing risk factors (DM, poor nutrition, etc.)
- may occur POD #3 after laparotomy when third space fluid re-distribution occurs

Clinical Features

- persistent spiking fever, dull pain, weight loss
- mass difficult to palpate
- peritoneal signs if abscess perforation and secondary peritonitis
- leukocytosis or leukopenia (immunocompromised, elderly)
- co-existing effusion (pleural effusion with subphrenic abscess)
- common sites: pelvis, Morrison's pouch (space between kidney and liver), subphrenic, paracolic gutters, lesser sac, peri-appendiceal, post-surgical anastomosis, diverticular, psoas

Investigations

- CBC, blood cultures x2
- CT ± water-soluble contrast
- DRE (pelvic abscess)

Treatment

- drain placement by interventional radiology (preferred), laparoscopy, open drainage
- subsequent antibiotic coverage, ciprofloxacin (Cipro®) + metronidazole (Flagyl®)

Paralytic Ileus

- see Bowel Obstruction, GS24

Delirium

- see Psychiatry, PS20 and Neurology, N21
SLIDING HIATUS HERNIA (Type I)
- see Figure 6
- herniation of both the stomach and the gastroesophageal (GE) junction into thorax
- 90% of esophageal hernias

Risk Factors
- age
- increased intra-abdominal pressure (e.g. obesity, pregnancy, coughing, heavy lifting)
- smoking

Clinical Features
- majority are asymptomatic
- larger hernias frequently associated with GERD due to decreased competence of LES

Complications
- most common complication is GERD
- other complications are rare and are related to reflux
  - esophagitis (dysphagia, heartburn)
  - consequences of esophagitis (peptic stricture, Barrett’s esophagus, esophageal carcinoma)
  - extra-esophageal complications (pneumonitis/pneumonia, asthma, cough, laryngitis)

Investigations
- CXR, barium swallow, endoscopy, or esophageal manometry (technique for measuring LES pressure)
- 24 h esophageal pH monitoring to quantify reflux
- gastroscopy with biopsy to document type and extent of tissue damage and rule out esophagitis, Barrett’s esophagus, and cancer

Treatment
- lifestyle modification
  - stop smoking, weight loss, elevate head of bed, no meals <3 h prior to sleeping, smaller and more frequent meals, avoid alcohol, coffee, mint, and fat
- medical
  - antacid, H₂-antagonist, PPI, prokinetic agent
- surgical (<15%)
  - if failure of medical therapy, esophageal stricture, severe nocturnal aspiration, Barrett’s esophagus
  - anti-reflux procedure (usually laparoscopic) e.g. Nissen fundoplication
    - fundus of stomach is wrapped around the lower esophagus and sutured in place
    - 90% success rate
**PARAESOPHAGEAL HIATUS HERNIA (Type II)**
- see Figure 6
- herniation of all or part of the stomach through the esophageal hiatus into the thorax with an undisplaced GE junction
- least common esophageal hernia (<10%)

**Clinical Features**
- usually asymptomatic due to normal GE junction
- pressure sensation in lower chest, dysphagia

**Complications**
- hemorrhage, incarceration, strangulation (gastric volvulus), obstruction, gastric stasis ulcer (Cameron’s lesion – causes Fe-deficiency anemia)

**Treatment**
- surgery to prevent severe complications
  - reduce hernia and excise hernia sac, repair defect at hiatus, and anti-reflux procedure (e.g. Nissen fundoplication)
  - may consider suturing stomach to anterior abdominal wall (gastropexy)
  - in very elderly patients at high surgical risk consider PEG (percutaneous endoscopic gastrostomy)

**MIXED HIATUS HERNIA (Type III)**
- see Figure 6
- combination of Types I and II

**TYPE IV HERNIA**
- herniation of other abdominal organs into thorax: colon, spleen, small bowel

---

**Esophageal Perforation**

**Etiology**
- iatrogenic (most common)
  - endoscopic, dilatation, biopsy, intubation, operative, NGT placement
- barogenic
  - trauma
  - repeated, forceful vomiting (Boerhaave’s syndrome)
  - other: convulsions, defecation, labour (rare)
- ingestion injury
  - foreign body, corrosive substance
- carcinoma

**Clinical Features**
- neck or chest pain
- fever, tachycardia, hypotension, dyspnea, respiratory compromise
- subcutaneous emphysema, pneumothorax, hematemesis

**Investigations**
- CXR: pneumothorax, pneumomediastinum, pleural effusion, subdiaphragmatic air
- CT chest: widened mediastinum, pneumomediastinum
- contrast swallow (water-soluble then thin barium): contrast extravasation

**Treatment**
- supportive if rupture is contained
  - NPO, vigorous fluid resuscitation, broad-spectrum antibiotics, possible percutaneous drainage
- surgical
  - <24 h
    - primary closure of a healthy esophagus or resection of diseased esophagus
  - >24 h or non-viable wound edges
    - diversion and exclusion followed by delayed reconstruction (i.e. esophagostomy proximally, close esophagus distally, gastrostomy/jejunalostomy for decompression/feeding)

**Complications**
- sepsis, abscess, fistula, empyema, mediastinitis, death
- post-operative esophageal leak
- mortality 10-50% dependent on timing of diagnosis
Esophageal Carcinoma

Epidemiology
- M:F = 3:1
- onset 50-60 yr of age
- upper (20-33%), middle (33%), lower (33-50%)
- main types:
  - most common worldwide: SCC in upper 2/3 of esophagus
  - most common in Western countries: adenocarcinoma in distal 1/3 of esophagus

Risk Factors
- geographic variation in incidence
- SCC
  - underlying esophageal disease such as strictures, diverticula, achalasia
  - smoking, alcohol, hot liquids
  - more common in patients from Asia
- adenocarcinoma
  - Barrett’s esophagus (most important), smoking, obesity (increased reflux), GERD

Clinical Features
- frequently asymptomatic: late presentation
- progressive dysphagia (mechanical): first solids then liquids
- odynophagia then constant pain
- constitutional symptoms
- regurgitation and aspiration (aspiration pneumonia)
- hematemesis, anemia
- tracheoesophageal or bronchoesophageal fistula
- direct, hemogenous, or lymphatic spread
  - trachea (coughing), recurrent laryngeal nerves (hoarseness, vocal paralysis), aortic, liver, lung, bone, celiac and mediastinal nodes

Investigations and Staging
- barium swallow: shows narrowing – suggestive but not diagnostic
- esophagoscopy: biopsy and assess resectability
- both SCC and adenocarcinoma use TNM staging system but have separate stage groupings according to histology
- endoscopic U/S (EUS)
  - visualize local disease
  - regional nodal involvement (number of nodes may be more important than location)
- bronchoscopy ± thoracoscopy
  - rule out airway invasion in tumours of the upper and mid esophagus
- full metastatic workup (CXR, bone scan, CT head, CT chest/abdomen/pelvis, LFTs, etc.)
- PET scan more sensitive than CT in detecting metastatic disease

Treatment
- if present with distant metastatic disease
  - treat with systemic therapy and treat symptoms (esophageal stent)
- if locally advanced (locally invasive disease or nodal disease on CT or EUS)
  - multimodal therapy
    - concurrent external beam radiation and chemotherapy (cisplatin and 5-FU)
    - possibility of curative esophagectomy after chemoradiation if disease responds well
  - if unable to tolerate multimodal therapy or if highly advanced disease, consider palliative resection, brachytherapy, or endoscopic dilatation/stenting/laser ablation for palliation
- if early stage (non-transmural and without evidence of nodal disease)
  - esophagectomy (transthoracic or trans-hiatal approach) and lymphadenectomy
  - anastomosis in chest or neck
  - stomach most often used for reconstruction; may also use colon
  - neoadjuvant chemotherapy and radiation are controversial
- adjuvant chemotherapy ± radiation usually recommended for post-operative node-positive disease

Prognosis
- prognosis usually poor because presentation is usually at advanced stage

OTHER DISORDERS
- esophageal motor disorders (see Gastroenterology, G8)
- esophageal varices (see Gastroenterology, G26)
- Mallory-Weiss tear (see Gastroenterology, G26)
**Thymoma**

**Epidemiology**
- most common neoplasms in thymus including both thymoma and thymic carcinoma
- patients between 40 and 60 yr
- M > F

**Risk Factors**
- no known risk factors, strong association with myasthenia gravis and other paraneoplastic syndromes

**Clinical presentation**
- frequently asymptomatic: incidental finding on imaging
- symptoms related to tumour size and location: chest pain, SOB, cough, phrenic nerve palsy
- ddx includes lymphoma, other anterior mediastinal tumours (see Respiratory, R21)

**Investigations**
- CT chest (and/or MRI)
- Germ cell tumor markers (β-hcg, alpha fetoprotein), thyroid function, PFTs

**Treatment**
- for patients with resectable disease
- open surgical resection of thymus via median sternotomy
- ± post-operative radiation based on Masaoka staging
- for non-surgical patients
- multimodal therapy including neoadjuvant or palliative chemotherapy and post-operative chemoradiotherapy if de-bulking procedure feasible

**Prognosis**
- depends upon stage of disease and resectability
- generally slow growing tumours

---

**Pleura, Lung, and Mediastinum**

- see Respiratory, R22

---

**Tube Thoracostomy**

**Indications**
- to drain abnormal large-volume air or fluid collections in the pleural space
  - hemothorax, chylothorax, empyema
  - pneumothorax, if
    - large or progressive
    - patient is on mechanical ventilation
    - bronchopleural fistula
    - tension pneumothorax
- to treat symptomatic and/or recurrent pleural effusion
  - see Respiratory, R22
  - for long-term drainage of malignant effusions
  - via facilitation of pleurodesis (obliteration of the pleural space by instilling talc or doxycycline to cause fibrosis and adherence of parietal and visceral pleura)

**Complications**
- overall complications are rare (1-3%)
- malposition (most common complication), especially by inexperienced operators
  - tubes may dissect along the external chest wall, or may be placed below the diaphragm
- bleeding (anticoagulation is a relative contraindication)
- local infection, empyema
- perforation of lung parenchyma
- risk of re-expansion pulmonary edema when large volumes of air or fluid are drawn off quickly (>1.0-1.5 L)
Lung Transplantation

Conditions Leading to Transplantation
- chronic acquired lung disease: COPD
- genetic: CF, emphysema due to α-1 antitrypsin deficiency
- idiopathic interstitial pneumonias: IPF, nonspecific interstitial pneumonitis
- HTN-related: IPAH, secondary pulmonary HTN, Eisenmenger’s syndrome
- other: sarcoidosis, lymphangioleiomyomatosis, pulmonary Langerhans cell histiocytosis

Clinical Indications
- transplantation should be considered for patients with advanced lung disease refractory to maximal medical or surgical therapy
- patients who are symptomatic during activities of daily living and limited expected survival over the next 2 yr

Criteria for Transplantation
- lung allocation score based on: 1) post-transplant survival measure, and 2) waiting list urgency measure
- transplant benefit = post-transplant survival (days) – waitlist survival (days)

Contraindications
- uncontrolled or untreatable pulmonary or extrapulmonary infection
- malignancy in the last 2 yr
- advanced cardiopulmonary disease
- significant chest wall/spinal deformity
- active cigarette smoking
- HIV infection, ongoing HBV or HCV infections

Post-Operative Complications
- primary graft dysfunction: main cause is ischemia-reperfusion injury, graded by PaO₂/FiO₂ ratio and CXR findings
- airway anastomotic complications (focal infection, bronchial necrosis and dehiscence, excess granulation tissue, tracheobronchomalacia, stenosis, fistula)
- chronic graft dysfunction: bronchiolitis obliterans syndrome
- infectious complications (bacterial, fungal, CMV, community-acquired respiratory viruses, mycobacteria)
- malignancy (non-melanoma skin cancer, post-transplant lymphoproliferative disease, colon, breast, Kaposi’s sarcoma, bladder)

Prognosis
- median survival for all adult recipients: 5.4 yr
- 1 yr survival: COPD > IPF > IPAH
- 10 yr survival: CF, α-1 antitrypsin deficiency > IPAH > COPD, IPF

Chronic Obstructive Pulmonary Disease
- see Respirology, R9

Treatment
- indications for surgical management
  - dyspnea despite maximal medical therapy and pulmonary rehabilitation
  - CT showing hyperinflation and heterogeneously distributed emphysema predominant in the upper lung zone
  - may be used as a bridging procedure to lung transplantation
- contraindications
  - age >75, cigarette smoking within the prior 6 mo, higher risk of surgical mortality
  - homogeneously distributed emphysematous changes without areas of preserved lung tissue
  - diffusing capacity of lung for carbon monoxide <20% of predicted, PaCO₂ >60 mmHg, PaO₂ <45 mmHg
- surgical procedures
  - lung volume reduction surgery: wedge excision of emphysematous tissue
  - bilateral or unilateral, thoracotomy or VATS

Complications of Treatment
- air leak: may require reintubation and mechanical ventilation
- arrhythmias, pneumonia

Prognosis
- total mortality at 2 yr same as with maximal medical therapy, but better exercise capacity and quality of life with LVRS

Long-Term Survival Analysis of the Canadian Lung Volume Reduction Surgery Trial
Study: Retrospective observational study assessing the long-term survival of patients enrolled in the CLVRS at 8-10 yr follow-up.
Results/Conclusions: 62 patients total. 52 patients had a median survival time of 4.11 yr. Compared with the best medical care group, patients in the LVRS group showed a 16-mo survival advantage and a 20% reduction in mortality. LVRS may provide long-term benefits in the treatment of end-stage emphysema, however, the results were not statistically significant.
**Peptic Ulcer Disease**

**GASTRIC ULCERS**
- see *Gastroenterology, G12*

**Indications for Surgery**
- refractory to medical management (intractability)
- suspicion of malignancy even if biopsy benign
- complications of PUD: obstruction, perforation, bleeding (3x greater risk compared to duodenal ulcers)
- surgical treatment is increasingly rare due to *H. pylori* eradication and medical treatment

**Procedures**
- ligation of bleeding vessels
- distal gastrectomy with ulcer excision: Billroth I or Billroth II or Roux-en-Y
- vagotomy and pyloroplasty only if acid hypersecretion (rare)
- wedge resection if possible or biopsy with primary repair

**DUODENAL ULCERS**
- see *Gastroenterology, Bleeding Peptic Ulcer, G12, and Peptic Ulcer Disease, G12*
- most within 2 cm of pylorus (duodenal bulb)

**Indications for Surgery**
- hemorrhage, rebleed in hospital, perforation, gastric outlet obstruction
- refractory to medical management (endoscopy)

**Procedures**
- Graham patch of perforated ulcer—plication of ulcer and omental patch
- oversewing of bleeding ulcer ± pyloroplasty
- pyloroplasty, gastrojejunostomy, or gastrojejunostomy (improved drainage)
- antrrectomy (eliminate hormonal stimulation from the antrum)
- gastric resection (decrease the number of parietal cells)
- vagotomy
  - rarely done now due to *H. pylori* eradication and PPI

**Complications of Surgery**
- retained antrum
- fistula (gastrocolic/gastrojejunal)
- dumping syndrome, postvagotomy diarrhea, af ferent loop syndrome (see *Complications of Gastric Surgery, GS20*)

### Gastric Carcinoma

#### Epidemiology
- 9th most common cancer in the world
- M:F = 3:2
- incidence of adenocarcinoma <10 (US) vs. 40 (Japan, Korea) per 100,000 (incidence highest in Asia, Latin America, and Caribbean)
- most common age group = 50-59 yr
- incidence has decreased by 2/3 in past 50 yr

#### Risk Factors
- compensatory epithelial cell proliferation via gastric atrophy from:
  - *H. pylori*, causing chronic atrophic gastritis
  - pernicious anemia associated with achlorhydria and chronic atrophic gastritis
  - previous partial gastrectomy (>10 yr post-gastrectomy)
- host-related factors
  - blood type A
  - hereditary nonpolyposis colorectal cancer (HNPPC), hereditary diffuse gastric carcinoma (HDGC)
  - gastric adenomatous polyps
  - hypertrophic gastropathy
- environmental factors: smoking, alcohol, smoked food, nitrosamines

#### Clinical Features
- clinical suspicion
  - ulcer fails to heal
  - lesion on greater curvature of stomach or cardia
- asymptomatic, insidious, or late onset of symptoms
  - postprandial abdominal fullness, vague epigastric pain
  - anorexia, weight loss
  - burping, N/V, dyspepsia, dysphagia
  - hepatomegaly, epigastric mass (25%)
  - hematemesis, fecal occult blood, melena, iron-deficiency anemia
- metastasis
  - peritoneum, liver, lung, brain

#### Investigations
- OGD and biopsy; EUS to assess pre-operative T-stage and N-stage
- CT chest/abdomen/pelvis (for metastatic workup see Table 7)

#### Table 6. TNM Classification System for Staging of Gastric Carcinoma (AJCC/IUCC 2010)

#### Signs of Metastatic Gastric Carcinoma
- Virchow’s node: left supraclavicular node
- Blumer’s shelf: mass in pouch of Douglas
- Krukenberg tumour: metastases to ovary
- Sister Mary Joseph node: umbilical metastases
- Irish’s node: left axillary nodes
Treatment
- adenocarcinoma
  - proximal lesions
    - total gastrectomy and Roux-en-Y esophagojejunostomy
  - distal lesions
    - distal gastrectomy: wide margins, en bloc removal of omentum and lymph nodes
- palliation
  - gastric resection to decrease bleeding and relieve obstruction, enables the patient to eat
  - radiation therapy
  - studies are showing larger role for chemotherapy
- lymphoma
  - *H. pylori* eradication, chemotherapy ± radiation, surgery in limited cases (perforation, bleeding, obstruction)

Gastrointestinal Stromal Tumour

Epidemiology
- most common mesenchymal neoplasm of GI tract
- derived from interstitial cells of Cajal (cells associated with Auerbach’s plexus that have autonomous pacemaker function which coordinate peristalsis throughout the GI tract)
- 75-80% associated with tyrosine kinase (c-KIT) mutations
- most common in stomach (50%) and proximal small intestine (25%), but can occur anywhere along GI tract
- typically present with vague abdominal mass, feeling of abdominal fullness, or with secondary symptoms of bleeding and anemia
- often discovered incidentally on CT, laparotomy, or endoscopy

Risk Factors
- Carney’s triad: GISTs, paraganglioma, and pulmonary chondroma
- Type IA neurofibromatosis

Investigations
- pre-operative biopsy: controversial, but useful for indeterminate lesions
  - not recommended if index of suspicion for GIST is high
  - percutaneous biopsy is NOT recommended due to high friability and risk of peritoneal spread

Treatment
- surgical resection if >2 cm; follow with serial endoscopy if <2 cm and resect if growing or symptomatic
- localized GIST
  - surgical resection with preservation of intact pseudocapsule
  - lymphadenectomy NOT recommended, as GISTs rarely metastasize to lymph nodes
  - consider imatinib post-operative for high-risk GIST (large, >4 cm with significant mitotic activity)
- advanced disease (i.e. metastases to liver and/or peritoneal cavity)
  - chemotherapy with imatinib

Prognosis
- risk of metastatic potential depends on
  - tumour size (worse if >10 cm)
  - mitotic activity (worse if >5 mitotic figures or 50/hpf)
  - degree of nuclear pleomorphism
  - location: with identical sizes, extra-gastric location has a higher risk of progression than GISTs in the stomach
- metastases to liver, omentum, peritoneum; nodal metastases rare

Bariatric Surgery
- weight reduction surgery for morbid obesity
- indications: BMI ≥40 without illness or BMI ≥35 with 1+ serious comorbidity (e.g. DM, CAD, sleep apnea, severe joint disease)

Surgical Options
- malabsorptive/restrictive
  - laparoscopic Roux-en-Y gastric bypass (most common – see Figure 9)
• staple off small gastric pouch (restrictive) with Roux-en-Y limb to pouch (malabsorptive) with dumping syndrome physiology
• most effective, higher complication rates
• restrictive
  • laparoscopic adjustable gastric banding
    • silicone band around fundus creates pouch, adjustable through port under skin
  • laparoscopic vertical banded gastroplasty
    • vertical stapled small gastric pouch with placement of silastic ring band
• malabsorptive
  • biliopancreatic diversion with duodenal switch
  • gastrectomy, enterointerostomy, duodenal division closure and duodenoenterostomy

Complications
• perioperative mortality ~1% (anastomotic leak with peritoneal signs, PE)
• obstruction at enterointerostomy (see Complications of Gastric Surgery)
• staple line dehiscence
• dumping syndrome
• cholelithiasis due to rapid weight loss (20-30%)
• band abscess (if long-term)

Complications of Gastric Surgery
• most resolve within 1 yr

Alkaline Reflux Gastritis (see Figure 10A)
• duodenal contents (bilious) reflux into stomach causing gastritis ± esophagitis
• treatment
  • medical: H2-blocker, metoclopramide, cholestyramine (bile acid sequestrant)
  • surgical: conversion of Billroth I or II to Roux-en-Y

Afferent Loop Syndrome (see Figure 10B)
• accumulation of bile and pancreatic secretions causes intermittent mechanical obstruction and distention of afferent limb
• clinical features
  • early postprandial distention, RUQ pain, nausea, bilious vomiting, anemia
• treatment: surgery (conversion to Roux-en-Y increases afferent loop drainage)

Dumping Syndrome (see Figure 10C)
• early – 15 min post-prandial
  • etiology
    • hyperosmotic chyme released into small bowel (fluid accumulation and jejunal distention)
  • clinical features
    • post-prandial symptoms
    • epigastric fullness or pain, emesis, nausea, diarrhea, palpitations, dizziness, tachycardia, diaphoresis
  • treatment
    • small multiple low carbohydrate, low fat, and high protein meals and avoidance of liquids with meals
    • last resort is interposition of antiperistaltic jejunal loop between stomach and small bowel to delay gastric emptying
  • late – 3 h post-prandial
    • etiology: large glucose load leads to large insulin release and hypoglycemia
    • treatment: small snack 2 h after meals

Blind-Loop Syndrome (see Figure 10D)
• bacterial overgrowth of colonic Gram-negative bacteria in afferent limb
• clinical features
  • anemia/weakness, diarrhea, malnutrition, abdominal pain, and hypocalcemia
• treatment: broad-spectrum antibiotics, surgery (conversion to Billroth I)

Postvagotomy Diarrhea (see Figure 10E)
• up to 25%
• bile salts in colon inhibit water resorption
• treatment: medical (cholestyramine), surgical (reversed interposition jejunal segment)
SMALL INTESTINE

Small Bowel Obstruction

Mechanical Small Bowel Obstruction

Etiology

Table 7. Common Causes of SBO

<table>

<td>Gallstones</td>
<td>Radiation stricture</td>
<td>Incarcerated hernia</td>
</tr>
<tr>
<td>Bezars</td>
<td>Adenocarcinoma</td>
<td>Peritoneal carcinomatosis</td>
</tr>
</tbody>
</table>

Pathophysiology

- obstruction → gas & fluid (swallowed or GI secretions) accumulate proximal to site of obstruction and distal decompression → intestinal activity increases to overcome obstruction → colicky pain and diarrhea (initially)
- bowel wall edema and disruption of normal bowel absorptive function can lead to increased intraluminal fluid and transudative fluid loss into peritoneal cavity, electrolyte disturbances
- increase intramural pressure can lead to impaired microvascular perfusion leading to intestinal ischemia and necrosis (strangulated bowel obstruction)
- three types
  - partial SBO: only a portion of intestine is occluded, allows passage of some gas & fluid, less likely to be strangulated
  - complete SBO: progression of pathophysiologic event is much faster than partial SBO
  - closed-loop obstruction: segment of intestine is obstructed both proximally and distally (e.g. volvulus), leading to rapid rise in intraluminal pressure from gas and fluid that cannot escape and rapid progression to strangulation

Risk Factors

- prior abdominal or pelvic surgery, abdominal wall or groin hernia, history of malignancy, prior radiation

Clinical Features

- 1) distinguish mechanical obstruction from ileus; 2) determine etiology of obstruction; 3) recognize partial from complete SBO; 4) differentiate simple from complicated (e.g. strangulated) obstruction
- symptoms: colicky abdominal pain, nausea/vomiting, obstipation
  - vomiting is more prominent with proximal than distal
  - more feculent vomitus suggest more established obstruction because of bacterial overgrowth
  - continue passage of gas and/or stool 6-12 h after onset of symptoms suggest partial than complete obstruction
- signs: abdominal distention (most prominent if obstruction at distal ileum), hyperactive proceeding to minimal bowel sound
  - strangulated obstruction: abdominal pain disproportionate to physical exam findings suggest intestinal ischemia
  - may have tachycardia, localized abdominal tenderness, fever, marked leukocytosis, lactate acidosis

Investigations

- radiological
  - abdominal x-ray (3 views): triad of dilated small bowel (>3 cm in diameter), air-fluid levels on upright film, paucity of air in colon (high sensitivity, low specificity as ileus and LBO can present similarly)
  - CT: discrete transition zone with proximal bowel dilation, distal bowel decompression, and intraluminal contrast does not pass the transition zone
    - most importantly to r/o ischemic bowel/strangulation: pneumatosis intestinalis (free air in bowel wall) & thickened bowel wall, air in portal vein, free intraperitoneal fluids, differential wall enhancements (poor uptake of IV contrast into the wall of the affected bowel)
  - other
    - less used: upper GI series/small bowel series (if no cause apparent, i.e. no hernias, no previous surgeries)
    - may consider U/S or MRI in pregnant patients

Increased Risk of Perforation with Distention as seen on Abdomen Imaging

- Small bowel ≥3 cm
- Distal colon ≥6 cm
- Proximal colon ≥9 cm
- Cecum ≥12 cm

Patients presenting with a SBO in setting of “virgin” abdomen should have surgery ASAP – EXCEPTION: malignant obstruction from history and imaging

In a non-virgin abdomen – adhesional SBOs resolve spontaneously with NGT decompression 70% of time

Top 3 Causes of SBO (in order)

- ABC
  - Adhesions
  - Bulge (hernias)
  - Cancer (neoplasms)

Causes of SBO

- SHAVING
  - Stricture
  - Hernia
  - Adhesions
  - Volvulus
  - Intussusception
  - Neoplasm
- G
  - Gallstones

MUST DO

- Rule out CRC in constipated patient
- Send for TURP in patient with BPH (treat intra-abdominal HTN)
laboratory
- may be normal early in disease course
- BUN, creatinine, hematocrit to assess degree of dehydration
- fluid, electrolyte abnormalities; metabolic alkalosis due to frequent emesis; amylase elevated
- if strangulation: leukocytosis with left shift, lactic acidosis, elevated LDH (late signs)

Treatment
- IV isotonic fluid resuscitation + urine output monitoring with catheter
- SBO related vomiting and decrease PO intake leads to volume depletion
- NG tube in the stomach for gastric decompression; decrease nausea, distention, and risk of aspiration from vomiting
- partial SBO/Crohn's/Carcinomatosis: conservative management with fluid resuscitation and NG tube decompression
- 48 h of watchful waiting; if no improvement or develops complications, surgery
- SBO with history of abdomen/pelvic surgery: conservative management
- 48 h of watchful waiting; if no improvement or develops complications, surgery
- complete SBO/strangulation: urgent surgery to prevent irreversible ischemia
- early post-operative SBO: if bowel function do not return within 3-5 d after surgery; usually partial, extended conservative therapy (2-3 wk) with bowel rest, fluids, and TPN is appropriate
- surgery if presence of peritonitis or complete SBO demonstrated

Prognosis
- related to etiology; mortality: non-strangulating <1%, strangulating 8% (25% if >36 h), ischemic = up to 50%

Prevention
- open surgery has four fold increase in risk of SBO in 5 yr compared to laparoscopic surgery

Functional Small Bowel Obstruction: Paralytic Ileus

Pathogenesis
- temporary, reversible impairment of intestinal motility; mostly frequently caused by:
  - abdominal operations, infections & inflammation, medications (opiates, anesthetics, psychotropics), and electrolyte abnormalities
  - passing gas is the most useful indicator
- NOT the same as intestinal pseudo-obstruction
- chronic pseudo-obstruction refers to specific disorders that affect the smooth muscle and myenteric plexus, leading to irreversible intestinal dysmotility

Clinical Features
- symptoms and signs of intestinal obstruction without mechanical obstruction
  - bowel sounds are diminished or absent (in contrast to initial hyperactive bowel sounds in SBO)

Investigations
- routine post-operative ileus: expected, no investigation needed
- if ileus persists or occurs without abdominal surgery
  - review patient medications (especially opiates)
  - measure serum electrolyte to monitor for electrolyte abnormalities (including extended lytes like Mg, Ca^{2+}, PO_{4})
  - CT scan to rule out abscess or peritoneal sepsis, or to exclude complete mechanical obstruction

Treatment
- most important: NPO + fluid resuscitation
- NGT decompression, correct causative abnormalities (e.g. sepsis, medications, electrolytes), consider TPN for prolonged ileus
- post-operative: gastric and small bowel motility returns by 24-48 h, colonic motility by 3-5 d
- current interest in novel therapies such as gum chewing and pharmacologic therapy (e.g. alvimopan, an opioid antagonists)
# Intestinal Ischemia

## Etiology
- **Acute**
  - arterio-occlusive mesenteric ischemia (AOMI)
  - thrombotic, embolic, extrinsic compression (e.g., strangulating hernia)
  - non-occlusive mesenteric ischemia (NOMI)
    - mesenteric vasoconstriction secondary to systemic hypoperfusion (preserves supply to vital organs)
    - mesenteric venous thrombosis (MVT)
  - consider hypercoagulable state (i.e., rule out malignancy), DVT (prevents venous outflow)
- **Chronic**: usually due to atherosclerotic disease – look for CVD risk factors
- can lead to occlusion in vessels that supplies the small intestine and the large intestine

## Clinical Features
- **Acute**: severe abdominal pain out of proportion to physical findings, vomiting, bloody diarrhea, bloating, minimal peritoneal signs early in course, hypotension, shock, sepsis
- **Chronic**: postprandial pain (from mesenteric angina), fear of eating, weight loss
- Common sites: SMA supplied territory, “watershed” areas of colon – splenic flexure, left colon, sigmoid colon

## Investigations
- **Laboratory**: leukocytosis (non-specific), lactic acidosis (late finding)
  - amylase, LDH, CK, ALP can be used to observe progress
  - hypercoagulability workup if suspect venous thrombosis
- **AXR**: portal venous gas, intestinal pneumatosis, free air if perforation
- **Contrast CT**: thickened bowel wall, luminal dilatation, SMA or SMV thrombus, mesenteric/portal venous gas, pneumatosis
- **CT angiography** is the gold standard for acute arterial ischemia

## Treatment
- Fluid resuscitation, correct metabolic acidosis, NPO, NGT decompression of stomach, prophylactic broad-spectrum antibiotics, avoid vasoconstrictors and digitalis
- Exploratory laparotomy
- Angiogram, embolectomy/thrombectomy, bypass/graft, mesenteric endarterectomy, anticoagulation therapy, percutaneous transluminal angioplasty ± stent
- Segmental resection of necrotic intestine
  - Assess extent of viability; if extent of bowel viability is uncertain, a second look laparotomy 12-24 h later is mandatory

# Tumours of Small Intestine

## Benign Tumours
- 10x more common than malignant
- Usually asymptomatic until large
- Most common sites: terminal ileum, proximal jejunum
- Polyps
  - Adenomas
  - Hamartomas
  - FAP (see Familial Colon Cancer Syndromes, GS33)
  - Juvenile polyps
- Other: leiomyomas, lipomas, hemangiomas

## Malignant Tumours
- Adenocarcinoma
- Carcinoid
- Lymphoma
- Sarcoma

## Carcinoid Syndrome Symptoms
- Flushing
- Diarrhea
- Right-sided heart failure
Table 8. Malignant Tumours of the Small Intestine

</table>

**Short Gut Syndrome**

**Definition**
- <200 cm of small bowel causing insufficient intestinal absorption leading to diarrhea, malnutrition, and dehydration

**Risk Factors**
- acute mesenteric ischemia: resection of large amount of bowel at once
- Crohn’s disease: cumulative resections
- malignancies

**Prognostic Factors**
- residual bowel length, residual colon length (reabsorption of water and electrolytes and some reabsorption of nutrients), condition of the remnant small bowel (healthier bowel facilitate better reabsorption), presence of ileocecal valve (delay transition into colon leading to more reabsorption)
- resection of ileum is less tolerated than resection of jejunum (ileum reabsorbs bile salt and vitamin B₁₂)
Therapy
• medical
  † TPN: replenish lost fluid and electrolytes in diarrhea
  † HT2R antagonist or PPI to prevent gastric acid secretion
  † antimotility agent to prolong transit time in the small intestine
  † consider octreotide to decrease GI secretion & cholestyramine for bile acid absorption
• surgical: non-transplant
  † to slow transit time: small bowel segmental reversal, intestinal valve construction, or electrical pacing of small bowel
  † to increase intestinal length:
    † LILT (longitudinal intestinal lengthening and tailoring) procedure
    † STEP (serial transverse enteroplasty procedure) in dilated small bowel
• surgical: transplant
  † indication: life-threatening complication from intestinal failure or long-term TPN
  † liver failure, thrombosis of major central veins, recurrent catheter-related sepsis, recurrent severe dehydration

Abdominal Hernia

• see Hiatus Hernia, GS12

Definition
• defect in abdominal wall causing abnormal protrusion of intra-abdominal contents

Epidemiology
• M:F = 9:1
• lifetime risk of developing a hernia: males 20-25%, females 2%
• frequency of occurrence: 50% indirect inguinal, 25% direct inguinal, 8-10% incisional (ventral), 5% femoral, 3-8% umbilical
• most common surgical disease of males

Risk Factors
• activities which increase intra-abdominal pressure
  † obesity, chronic cough, asthma, COPD, pregnancy, constipation, bladder outlet obstruction, ascites, heavy lifting
• congenital abnormality (e.g. patent processus vaginalis, indirect inguinal hernia)
• previous hernia repair, especially if complicated by wound infection
• loss of tissue strength and elasticity (e.g. hiatus hernia, aging, repetitive stress)

Clinical Features
• mass of variable size
• tenderness worse at end of day, relieved with supine position or with reduction
• abdominal fullness, vomiting, constipation
• tenderness worse at end of day, relieved with supine position or with reduction
• mass of variable size
• transmits palpable impulse with coughing or straining

Investigations
• physical examination usually sufficient
• U/S ± CT (CT required for obturator hernias, internal abdominal hernias, and Spigelian and/or femoral hernias in obese patients)

Classification
• complete: hernia sac and contents protrude through defect
• incomplete: partial protrusion through the defect
• internal hernia: sac herniating into or involving intra-abdominal structure
• external hernia: sac protrudes completely through abdominal wall
• strangulated hernia: vascular supply of protruded viscus is compromised (ischemia)
  † requires emergency repair
• incarcerated hernia: irreducible hernia, not necessarily strangulated
• Richter’s hernia: only part of bowel circumference (usually anti-mesenteric border) is incarcerated or strangulated so may not be obstructed
  † a strangulated Richter’s hernia may self-reduce and thus be overlooked, leaving a gangrenous segment at risk of perforation in the absence of obstructive symptoms
• sliding hernia: part of wall of hernia sac formed by retroperitoneal structure (usually colon)

Indirect Inguinal Hernias: Rule of 5s
5% lifetime incidence in males
5x more common than direct inguinal hernias
5-10x more common in males than females
Generally occur by 5th decade of life

Risk Factors
• obesity, chronic cough, asthma, COPD, pregnancy, constipation, bladder outlet obstruction, ascites, heavy lifting

Clinical Features
• mass of variable size
• tenderness worse at end of day, relieved with supine position or with reduction
• abdominal fullness, vomiting, constipation
• tenderness worse at end of day, relieved with supine position or with reduction
• mass of variable size
• transmits palpable impulse with coughing or straining

Investigations
• physical examination usually sufficient
• U/S ± CT (CT required for obturator hernias, internal abdominal hernias, and Spigelian and/or femoral hernias in obese patients)

Classification
• complete: hernia sac and contents protrude through defect
• incomplete: partial protrusion through the defect
• internal hernia: sac herniating into or involving intra-abdominal structure
• external hernia: sac protrudes completely through abdominal wall
• strangulated hernia: vascular supply of protruded viscus is compromised (ischemia)
  † requires emergency repair
• incarcerated hernia: irreducible hernia, not necessarily strangulated
• Richter’s hernia: only part of bowel circumference (usually anti-mesenteric border) is incarcerated or strangulated so may not be obstructed
  † a strangulated Richter’s hernia may self-reduce and thus be overlooked, leaving a gangrenous segment at risk of perforation in the absence of obstructive symptoms
• sliding hernia: part of wall of hernia sac formed by retroperitoneal structure (usually colon)
Anatomical Types
- groin (see Tables 9 and 10)
  - indirect and direct inguinal, femoral (see Figure 14)
  - pantaloon: combined direct and indirect hernias, peritoneum draped over inferior epigastric vessels
- epigastric: defect in linea alba above umbilicus
- incisional: ventral hernia at site of wound closure, may be secondary to wound infection
- other: Littre’s (involving Meckel’s), Amyand’s (containing appendix), lumbar, obturator, peristomal, umbilical, Spigelian (ventral hernia through linea semilunaris)

Complications
- incarceration
- strangulation
  - small, new hernias more likely to strangulate
  - femoral >> indirect inguinal > direct inguinal
- intense pain followed by tenderness
- intestinal obstruction, gangrenous bowel, sepsis
- surgical emergency
- DO NOT attempt to manually reduce hernia if septic or if contents of hernial sac gangrenous
  - will cause closed loop SBO – and EMERGENCY

Treatment
- surgical treatment (herniorrhaphy) is only to prevent strangulation and evisceration, for symptomatic relief, for cosmesis; if asymptomatic can delay surgery
- repair may be done open or laparoscopic and may use mesh for tension-free closure
- most repairs are now done using tension free techniques – a plug in the hernial defect and a patch over it or patch alone
- observation is acceptable for small asymptomatic inguinal hernias

Post-Operative Complications
- recurrence (15–20%)
  - risk factors: recurrent hernia, age >50, smoking, BMI >25, poor pre-operative functional status (ASA ≥ 3 – see Anesthesia and Perioperative Medicine, A4), associated medical conditions: type 2 DM, hyperlipidemia, immunosuppression, any comorbid conditions increasing intra-abdominal pressure
  - less common with mesh/“tension-free” repair
 - scrotal hematoma (3%)
  - painful scrotal swelling from compromised venous return of testes
  - deep bleeding: may enter retroperitoneal space and not be initially apparent
  - difficulty voiding
- nerve entrapment
  - ilioinguinal (causes numbness of inner thigh or lateral scrotum)
  - genital branch of genitofemoral (in spermatic cord)
- stenosis/occlusion of femoral vein
  - acute leg swelling
- ischemic colitis

Appendix

Appendicitis

Epidemiology
- 6% of population, M>F
- 80% between 5-35 yr of age

Pathogenesis
- luminal obstruction → bacterial overgrowth → inflammation/swelling → increased pressure → localized ischemia → gangrene/perforation → localized abscess (walled off by omentum) or peritonitis
- etiology
  - children or young adult: hyperplasia of lymphoid follicles, initiated by infection
  - adult: fibrosis/stricture, fecolith, obstructing neoplasm
  - other causes: parasites, foreign body

Clinical Features
- most reliable feature is progression of signs and symptoms
- low grade fever (38°C), rises if perforation
- abdominal pain then anorexia, N/V
- classic pattern: pain initially periumbilical; constant, dull, poorly localized, then well localized pain over McBurney's point
  - due to progression of disease from visceral irritation (causing referred pain from structures of the embryonic midgut, including the appendix) to irritation of parietal structures
  - McBurney's sign
  - signs
    - inferior appendix: McBurney's sign (see sidebar), Rovsing's sign (palpation pressure to left abdomen causes McBurney's point tenderness). McBurney's sign is present whenever the opening of the appendix at the cecum is directly under McBurney's point; therefore McBurney's sign is present even when the appendix is in different locations
    - retrocecal appendix: psoas sign (pain on flexion of hip against resistance or passive hyperextension of hip)
    - pelvic appendix: obturator sign (flexion then external or internal rotation about right hip causes pain)
- complications
  - perforation (especially if >24 h duration)
  - abscess, phlegmon

Investigations
- laboratory
  - mild leukocytosis with left shift (may have normal WBC counts)
  - higher leukocyte count with perforation
  - β-hCG to rule out ectopic pregnancy
  - urinalysis
- imaging
  - of psoas shadow, RLQ ileus
  - U/S: may visualize appendix, but also helps rule out gynecological causes – overall accuracy 90-94%, can rule in but CANNOT rule out appendicitis (if >6 mm, SENS/SPEC/PPV/PPV 98%)
  - upright CXR, AXR: usually nonspecific – free air if perforated (rarely), calcified fecolith, loss of psoas shadow, RLQ ileus
  - CT scan: thick wall, appendicolith, inflammatory changes – overall accuracy 94-100%, optimal investigation

Watchful Waiting vs. Repair of Inguinal Hernia in Minimally Symptomatic Men: A Randomized Clinical Trial

Outcomes of Laparoscopic vs. Open Repair of Primary Ventral Hernias

McBurney’s Sign
Tenderness 1/3 the distance from the ASIS to the umbilicus on the right side
Inflammatory Bowel Disease

Principles of Surgical Management
- can alleviate symptoms, address complications, improve quality of life
- conserve bowel: resect as little as possible to avoid short gut syndrome
- perioperative management
  - optimize medical status: may require TPN (especially if >7 d NPO) and bowel rest
  - hold immunosuppressive therapy pre-operative, provide pre-operative stress dose of corticosteroid if patient had recent steroid therapy, taper steroids post-operative
  - DVT prophylaxis: heparin (IBD patients at increased risk of thromboembolic events)

Crohn’s Disease

Treatment
- surgery is NOT curative, but over lifetime ~70% of Crohn’s patients will have surgery
- indications for surgical management
  - failure of medical management
  - SBO (due to stricture/inflammation): indication in 50% of surgical cases
  - abscess, fistula (enterocolic, vesicular, vaginal, cutaneous abscess), quality of life, perforation, hemorrhage, chronic disability, failure to thrive (children), perianal disease
- surgical procedures
  - resection and anastomosis/stoma if active or subacute inflammation, perforation, fistula
  - resection margin only has to be free of gross disease (microscopic disease irrelevant to prognosis)
  - stricturoplasty – widens lumen in chronically scarred bowel: relieves obstruction without resecting bowel (contraindicated in acute inflammation)

Complications of Treatment
- short gut syndrome (diarrhea, steatorrhea, malnutrition)
- fistulas
- gallstones (if terminal ileum resected, decreased bile salt resorption → increased cholesterol precipitation)
- kidney stones (loss of calcium in diarrhea → increased oxalate absorption and hyperoxaluria → stones)

Prognosis
- recurrence rate at 10 yr: ileocolic (25-50%), small bowel (50%), colonic (40-50%)
- re-operation at 5 yr: primary resection (20%), bypass (50%), stricturoplasty (10% at 1 yr)
- 80-85% of patients who need surgery lead normal lives
- mortality: 15% at 30 yr
Ulcerative Colitis

• see Gastroenterology, G22

Treatment

• indications for surgical management
  ▪ failure of medical management (including inability to taper steroids)
  ▪ complications: hemorrhage, obstruction, perforation, toxic megacolon (emergency), failure to thrive (children)
  ▪ reduce cancer risk (1-2% risk per yr after 10 yr of disease)
• surgical procedures
  ▪ proctocolectomy and ileal pouch-anal anastomosis (IPAA) ± rectal mucosectomy (operation of choice)
  ▪ proctocolectomy with permanent end ileostomy (if not a candidate for ileoanal procedures)
  ▪ colectomy and IPAA ± rectal mucosectomy
  ▪ in emergency: total colectomy and ileostomy with Hartmann closure of the rectum, rectal preservation

Complications of Treatment

• early: bowel obstruction, transient urinary dysfunction, dehydration (high stoma output), anastomatic leak
• late: stricture, anal fistula/abscess, pouchitis, poor anorectal function, reduced fertility

Prognosis

• mortality: 5% over 10 yr
• total proctocolectomy will completely eliminate risk of cancer
• perforation of the colon is the leading cause of death from ulcerative colitis

LARGE INTESTINE

Large Bowel Obstruction

Mechanical Large Bowel Obstruction

Etiology

Table 11. Common Causes of LBO

<table>
<thead>

<td>Adhesions</td>
</tr>
<tr>
<td>IBD stricture</td>
<td>Radiation stricture</td>
<td>Hemias (sigmoid colon in a large groin hemia)</td>
</tr>
</tbody>
</table>

Clinical Features (unique to LBO)

• open loop (10-20%)
  ▪ incompetent ileocecal valve allows relief of colonic pressure as contents reflux into ileum, therefore clinical presentation similar to SBO
• closed loop (80-90%) (dangerous)
  ▪ competent ileocecal valve, resulting in proximal and distal occlusions
  ▪ massive colonic distention → increased pressure in cecum → bowel wall ischemia → necrosis → perforation

Treatment

• surgical correction of obstruction (usually requires resection + temporary diverting colostomy)
• volvulus requires sigmoidoscopic or endoscopic decompression followed by operative reduction if unsuccessful
  ▪ if successful, consider sigmoid resection on same admission
• cecal volvulus can be a true volvulus or a cecal ‘basculé’ (cecum folds anteriorly to the ascending colon producing a flap valve occlusion to cecal emptying) – both need surgical treatment

Prognosis

• overall mortality: 10%
• cecal perforation + feculent peritonitis: 20% mortality

Functional LBO: Colonic Pseudo-obstruction (Ogilvie’s Syndrome)

Definition
- acute pseudo-obstruction
- distention of colon without mechanical obstruction in distal colon
- arises in bedridden patients with serious extra-intestinal illness or trauma
- exact mechanism unknown, likely autonomic motor dysregulation → possibly sympathetic deprivation to colon, unopposed parasympathetic tone, and interruption of sacral parasympathetic tone to distal bowel
- first presents with abdominal distention (>90%) ± tenderness
- later symptoms mimic true obstruction

Associations
- most common: trauma, infection, cardiac (MI, CHF)
- disability (long-term debilitation, chronic disease, bed-bound nursing home patients, paraplegia), drugs (narcotic use, laxative abuse, polypharmacy), other (recent orthopedic or neurosurgery, post-partum, electrolyte abnormalities including hypokalemia, retroperitoneal hematoma, diffuse carcinomatosis)

Clinical Features
- Most prominent is abdominal distention (acute or gradual over 3-7 days)
- Abdominal pain, nausea and vomiting, constipation/diarrhea
- Watch out for fever, leukocytosis, and presence of peritoneal signs

Investigations
- AXR: cecal dilatation – if diameter ≥12 cm, increased risk of perforation

Treatment
- treat underlying cause
- NPO, NGT
- decompression: rectal tube, colonoscopy, neostigmine (cholinergic drug), surgical decompression (ostomy/resection) uncommon
- surgery (extremely rare): if perforation, ischemia, or failure of conservative management

Prognosis
- most resolve with conservative management

Diverticular Disease

Definitions
- diverticulum: abnormal sac-like protrusion from the wall of a hollow organ
- diverticulosis: presence of multiple diverticula
- diverticulitis: inflammation of diverticula
- true (congenital) diverticuli: contain all layers of colonic wall, often right-sided
- false (acquired) diverticuli: contain mucosa and submucosa, often left-sided
# Diverticulosis

**Epidemiology**
- 5-50% of Western population, lower incidence in non-Western countries, M=F
- prevalence is age dependent: <5% by age 40, 30% by age 60, 65% by age 85
- 95% involve sigmoid colon (site of highest pressure)

**Pathogenesis**
- risk factors
  - lifestyle: low-fibre diet (predispose to motility abnormalities and higher intraluminal pressure), inactivity, obesity
  - muscle wall weakness from aging and illness (e.g. Ehler-Danlos, Marfan's)
- high intraluminal pressures cause outpouching to occur at point of greatest weakness, most commonly where vasa recta penetrate the circular muscle layer, therefore increased risk of hemorrhage

**Clinical Features**
- uncomplicated diverticulosis: asymptomatic (70-80%)
- episodic abdominal pain (often LLQ), bloating, flatulence, constipation, diarrhea
- absence of fever/leukocytosis
- no physical exam findings or poorly localized LLQ tenderness
- complications
  - diverticulitis (15-25%): 25% of which are complicated (i.e. abscess, obstruction, perforation, fistula)
  - bleeding (5-15%): PAINLESS rectal bleeding, 30-50% of massive LGIB
  - diverticular colitis (rare): diarrhea, hematochezia, tenesmus, abdominal pain

**Treatment**
- uncomplicated diverticulosis: high fibre, education
- diverticular bleed
  - initially workup and treat as any LGIB
  - if hemorrhage does not stop, resect involved region

---

# Diverticulitis

**Epidemiology**
- 95% left-sided in patients of Western countries, 75% right-sided in Asian populations

**Pathogenesis**
- erosion of the wall by increased intraluminal pressure or inspissated food particles → inflammation and focal necrosis → micro or macroscopic perforation
- usually mild inflammation with perforation walled off by pericolic fat and mesentery; abscess, fistula, or obstruction can ensue
- poor containment results in free perforation and peritonitis

**Clinical Features**
- depend on severity of inflammation and whether or not complications are present; hence ranges from asymptomatic to generalized peritonitis
- LLQ pain/tenderness (2/3 of patients) often for several days before admission
- constipation, diarrhea, N/V, urinary symptoms (with adjacent inflammation)
• complications (25% of cases)
  ▪ abscess: palpable tender abdominal mass
  ▪ fistula: colovesical (most common), colorectal, colovaginal, colocutaneous
  ▪ colonic obstruction: due to scarring from repeated inflammation
  ▪ perforation: generalized peritonitis (feculent vs. purulent)
    ▪ recurrent attacks rarely lead to peritonitis
• low-grade fever, mild leukocytosis common, occult or gross blood in stool rarely coexist with acute diverticulitis

Investigations
• AXR, upright CXR
  ▪ localized diverticulitis (ileus, thickened wall, SBO, partial colonic obstruction)
  ▪ free air may be seen in 30% with perforation and generalized peritonitis
• CT scan (test of choice): very useful for assessment of severity and prognosis; usually done with rectal contrast
  ▪ 97% sensitive, 99% specific
  ▪ increased soft tissue density within pericolic fat secondary to inflammation, diverticula
    secondary to inflammation, bowel wall thickening, soft tissue mass (pericolic fluid, abscesses), fistula
  ▪ 10% of diverticulitis cannot be distinguished from carcinoma
• elective evaluations: establish extent of disease and rule out other diagnoses (polyps, malignancy) after resolution of acute episode
  ▪ colonoscopy or barium enema and flexible sigmoidoscopy

Treatment
• uncomplicated: conservative management
• outpatient: clear fluids only until improvement and antibiotics (e.g. ciprofloxacin and metronidazole) 7-10 d to cover gram negative rods and anaerobes (e.g. B. fragilis)
• hospitalize: if severe presentation, inability to tolerate oral intake, significant comorbidities, fail to improve outpatient management
• treat with NPO, IVF, IV antibiotics (e.g. IV ceftriaxone + metronidazole, ampicillin, gentamicin)
• indications for surgery
  ▪ unstable patient with peritonitis
  ▪ Hinchey stage 3-4
  ▪ after 1 attack if immunosuppressed
  ▪ consider after >4 episodes, recent trend is toward conservative management of recurrent mild/moderate attacks
  ▪ complications: generalized peritonitis, free air, abscess, fistula, obstruction, hemorrhage, inability to rule out colon cancer on endoscopy, or failure of medical management
• surgical procedures
  ▪ for emergency or complex cases: Hartmann procedure
    ▪ traditionally, Hartmann procedure was done, with colon resection + colostomy and rectal stump → colostomy reversal in 3-6 mo
    ▪ emerging evidence suggests that for Hinchey stage III acute complicated diverticulitis, laparoscopic peritoneal lavage with drain placement near the affected colon, in addition to IV antibiotics (NO resections), offers lower mortality and morbidity compare to Hartmann procedure. This procedure is gradually becoming standard practice
  ▪ elective cases or minimal contamination of the abdominal cavity: consider colon resection + primary anastomosis

Prognosis
• mortality rates: 6% for purulent peritonitis, 35% for fecal peritonitis
• recurrence rates: 13-30% after first attack, 30-50% after second attack

Colorectal Neoplasms

Colorectal Polyps

Definition
- polyp: protuberance into the lumen of normally flat colonic mucosa
- sessile (flat) or pedunculated (on a stalk)

Epidemiology
- 30% of the population have polyps by age 50, 40% by age 60, 50% by age 70

Clinical Features
- 50% in the rectosigmoid region, 50% are multiple
- usually asymptomatic, do not typically bleed, tenesmus, intestinal obstruction, mucus
- usually detected during routine endoscopy or Familial/High risk screening

Pathology
- non-neoplastic
  - hyperplastic: most common non-neoplastic polyp
  - mucosal polyps: small <5 mm, no clinical significance
  - inflammatory pseudopolyps: associated with IBD, no malignant potential
  - submucosal polyps: lymphoid aggregates, lipomas, leiomyomas, carcinoids
- neoplastic
  - lipomas, leiomyomas, carcinoids
  - hamartomas: juvenile polyps (large bowel), Peutz-Jegher syndrome (small bowel)
  - malignant risk due to associated adenomas (large bowel)
  - low malignant potential → most spontaneously regress or autoamputate
  - adenomas: premalignant, considered carcinoma in situ IF high grade dysplasia
  - some may contain invasive carcinoma (“malignant polyp” – 3-9%): invasion into submucosa
    - malignant potential: villous > tubulovillous > tubular

</tbody>
</table>

Investigations
- colonoscopy is the gold standard for diagnosis and treatment of colonic polyps
- CT colonography: increasing in availability; patients still require bowel prep and will require colonoscopy if polyps are identified
- other: flexible sigmoidoscopy if polyps are detected, proceed to colonoscopy for examination of entire bowel and biopsy

Treatment
- indications: symptoms, malignancy or risk of malignancy (i.e. adenomatous polyps)
- endoscopic removal of entire growth
- indications for segmental resection for malignant polyps: 1) lymphovascular invasion; 2) tumour budding; 3) positive resection margin; 4) poorly differentiated cells; 5) evidence of regional or distant metastases on staging. Most of these cases are usually discussed at multidisciplinary tumour boards
- follow-up endoscopy 1 yr later, then every 3-5 yr

Familial Colon Cancer Syndromes

FAMILIAL ADENOMATOUS POLYPOSIS

Pathogenesis
- autosomal dominant inheritance, mutation in adenomatous polyposis coli (APC) gene on chromosome 5q21

Clinical Features
- hundreds to thousands of colorectal adenomas usually by age 20 (by 40s in attenuated FAP)
extracolonic manifestations
- carcinoma of small bowel (i.e. polyps in colon), bile duct, pancreas, stomach, thyroid, adrenal, small bowel
- congenital hypertrophy of retinal pigment epithelium presents early in life in 2/3 of patients; 97% sensitivity
- virtually 100% lifetime risk of colon cancer (because of number of polyps)
- variants
  - Gardner’s syndrome: FAP + extra-intestinal lesions (sebaceous cysts, osteomas, desmoid tumours)
  - Turcot syndrome: FAP + CNS tumours (childhood cerebellar medulloblastoma)

Investigations
- genetic testing (80-95% sensitive, 99-100% specific)
- if no polyposis found: annual flexible sigmoidoscopy from puberty to age 50, then routine screening
- if polyposis or APC gene mutation found: annual colonoscopy and consider surgery (see Figure 16); consider upper endoscopy to evaluate for periampullary tumours

Treatment
- surgery indicated by age 17-20
- total proctocolectomy with ileostomy or total colectomy with ileorectal anastomosis
- doxorubicin-based chemotherapy
- NSAIDs for intra-abdominal desmoids

HEREDITARY NON-POLYPOSIS COLORECTAL CANCER – LYNCH SYNDROME

Pathogenesis
- autosomal dominant inheritance, mutation in a DNA mismatch repair gene (MSH2, MSH6, MLH1) resulting in microsatellite genomic instability and subsequent mutations
- microsatellite instability account for approximately 15% of all colorectal cancers

Clinical Features
- early age of onset, right > left colon, synchronous and metachronous lesions
- mean age of cancer presentation is 44 yr, lifetime risk 70-80% (M>F)
  - HNPCC I: hereditary site-specific colon cancer
  - HNPCC II: cancer family syndrome – high rates of extracolonic tumours (endometrial, ovarian, hepatobiliary, small bowel)

Diagnosis
- Amsterdam Criteria
  - 3 or more relatives with verified Lynch syndrome associated cancers, and 1 must be 1st degree relative of the other 2
  - 2 or more generations involved
  - 1 case must be diagnosed before 50 yr old
  - FAP is excluded
- genetic testing (80% sensitive) – colonoscopy mandatory even if negative
  - refer for genetic screening individuals who fulfill EITHER the Amsterdam Criteria (as above) OR the revised Bethesda Criteria (see sidebar)
- colonoscopy (starting age 20) annually
- surveillance for extracolonic lesions

Treatment
- total colectomy and ileorectal anastomosis with annual proctoscopy

Colorectal Carcinoma

Epidemiology
- 4th most common cancer (after lung, prostate, and breast), 2nd most common cause of cancer death

Risk Factors
- most patients have no specific risk factors
- age >50 (dominant risk factor in sporadic cases), mean age is 70
- genetic: FAP, HNPCC, family history of CRC
- colonic conditions
  - adenomatous polyps (especially if >1 cm, villous, multiple)
  - IBD (especially UC: risk is 1-2%/yr if UC >10 yr)
  - previous colorectal cancer (also gonadal or breast)
• diet (increased fat, red meat, decreased fibre) and smoking
• DM and acromegaly (insulin and IGF-1 are growth factors for colonic mucosal cells)

Pathogenesis
• adenoma–carcinoma sequence; rarely arise de novo

Clinical Features
• often asymptomatic
• hematochezia/melena, abdominal pain, change in bowel habits
• others: weakness, anemia, weight loss, palpable mass, obstruction
• 20% patients have distant metastatic disease at time of presentation
• spread
  ▪ direct extension, lymphatic, hematogenous (liver most common, lung, bone, brain; tumour of distal rectum → IVC → lungs)
  ▪ peritoneal seeding: ovary, Blumer’s shelf (pelvic cul-de-sac)

</tr>
<tr>
<td>Signs</td>
<td>Fe-deficiency anemia, RLQ mass (10%)</td>
<td>BRBPR, LBO</td>
</tr>
</tbody>
</table>

Investigations
• colonoscopy (best), look for synchronous lesions (3-5% of patients); alternative: air contrast barium enema (‘apple core’ lesion) + sigmoidoscopy
• if a patient is FOBT +ve, or has microcytic anemia or has a change in bowel habits, do colonoscopy
• laboratory: CBC, urinalysis, liver enzymes, liver function tests, carcinoembryonic antigen (CEA) (pre-operative for baseline, >5 ng/mL have worse prognosis)
• staging (see Table 16 and sidebar GS35): CT chest/abdomen/pelvis; bone scan, CT head only if lesions suspected
• rectal cancer: pelvic MRI or endorectal U/S to determine T and N stage

Table 16. TNM Classification System for Staging of Colorectal Carcinoma (AJCC/IUCC 2010)

</tbody>
</table>

Treatment
• colon cancer
  ▪ wide surgical resection of lesion and regional lymphatic drainage; usually colectomy with primary anastomosis
  ▪ curative: wide resection of lesion (5 cm margins) with nodes and mesentery
  ▪ palliative: if distant spread, local control for hemorrhage or obstruction
  ▪ care is taken to not spread tumour by unnecessary palpation
  ▪ cancer-bearing portion of colon is removed according to vascular distribution of segment
  ▪ adjuvant chemotherapy (5-FU or oral capcitabine with oxaliplatin) for stage III and is considered in select stage II patients

• rectal cancer
  ▪ choice of operation depends on individual case; types of operations
  ▪ low anterior resection of rectum (LAR): curative procedure of choice if adequate distal margins; uses technique of total mesorectal excision
  ▪ abdominoperineal resection of rectum (APR): if adequate distal margins cannot be obtained; involves the removal of distal sigmoid colon, rectum, and anus – permanent end colostomy required
  ▪ local excision: for select T1 lesions only
  ▪ palliative procedures involve proximal diversion with an ostomy for obstruction and radiation for bleeding or pain
  ▪ adjuvant therapy
    ▪ combined neoadjuvant chemoradiation therapy followed by post-operative adjuvant chemotherapy for stages II and III

Figure 18. APR vs. LAR

APR removes distal sigmoid colon, rectum, and anus; permanent end colostomy required
LAR removes distal sigmoid and rectum with anastomosis of distal colon to anus
Follow-Up
• currently there are no data suggesting optimal follow-up
• combination of periodic CT chest/abdomen/pelvis, CEA, and colonoscopy is recommended
• CEA to monitor for initial response to treatment, and to assess for recurrence q3mo (not a screening test)
• intensive follow-up improves overall survival in low-risk patients

Other Conditions of the Large Intestine

Angiodysplasia
Definition
• vascular anomaly: focal submucosal venous dilatation and tortuosity

Clinical Features
• most frequently in right colon of patients >60 yr old
• bleeding typically intermittent, rarely massive, not usually hypotensive (melena, anemia, guaiac positive stools)

Investigations
• colonoscopy: cherry red spots, branching pattern from central vessel
• angiography: early-filling vein, vascular tuft, delayed emptying vein; rarely active bleeding
• RBC technetium-99 scan
• barium enema is contraindicated (obscures other x-rays, i.e. angiogram)

Treatment
• none if asymptomatic
• cautery, right hemicolectomy, embolization, vasopressin infusion, sclerotherapy, band ligation, laser, octreotide, and rarely segmental resection if other treatments fail

Volvulus
Definition
• rotation of segment of bowel about its mesenteric axis
• sigmoid (65%), cecum (30%), transverse colon (3%), splenic flexure (2%)
• 5-10% of large bowel obstruction; 25% of intestinal obstruction during pregnancy

Risk Factors
• age (50% of patients >70 yr: stretching/elongation of bowel with age is a predisposing factor)
• high fibre diet (can cause elongated/redundant colon), chronic constipation, laxative abuse, pregnancy, bedridden, institutionalization (less frequent evacuation of bowels)
• congenital hypermobile cecum

Clinical Features
• symptoms due to bowel obstruction (see Large Bowel Obstruction, GS30) or intestinal ischemia (see Intestinal Ischemia, GS24)
• colicky abdominal pain, persistence of pain between spasms, abdominal distention, vomiting

Investigations
• AXR (classic findings): “omega”, “bent inner-tube”, “coffee-bean” signs
• barium/Gastrografin* enema: “ace of spades” (or “bird’s beak”) appearance due to funnel-like luminal tapering of lower segment towards volvulus
• sigmoidoscopy or colonoscopy as appropriate
• CT

Treatment
• initial supportive management (same as initial management for bowel obstruction (see Large Bowel Obstruction, GS30)
• cecum
  • nonsurgical
  • may attempt colonoscopic detorsion and decompression
  • surgical
  • right colectomy + ileotransverse colonic anastomosis

</table>
• sigmoid
  • nonsurgical
    • decompression by flexible sigmoidoscopy and insertion of rectal tube past obstruction
    • subsequent elective surgery recommended (50-70% recurrence)
  • surgical: Hartmann procedure (if urgent)
    • indications: strangulation, perforation, or unsuccessful endoscopic decompression

## Toxic Megacolon

### Pathogenesis
- extension of inflammation into smooth muscle layer causing paralysis
- damage to myenteric plexus and electrolyte abnormalities are not consistently found

### Etiology
- inflammatory bowel disease (ulcerative colitis > Crohn's disease)
- infectious colitis: bacterial (C. difficile, Salmonella, Shigella, Campylobacter), viral (cytomegalovirus), parasitic (E. histolytica)

### Clinical Features
- infectious colitis usually present for >1 wk before colonic dilatation
- diarrhea ± blood (but improvement of diarrhea may portend onset of megacolon)
- abdominal distention, tenderness, ± local/general peritoneal signs (suggest perforation)
- triggers: hypokalemia, constipating agents (opioids, antidepressants, loperamide, anticholinergics), barium enema, colonoscopy

### Diagnostic Criteria
- must have both colitis and systemic manifestations for diagnosis
- radiologic evidence of dilated colon
- three of: fever, HR >120, WBC >10.5, anemia
- one of: fluid and electrolyte disturbances, hypotension, altered LOC

### Investigations
- CBC (leukocytosis with left shift, anemia from bloody diarrhea), electrolytes, elevated CRP, ESR
- metabolic alkalosis (volume contraction and hypokalemia) and hypoalbuminemia are late findings
- AXR: dilated colon >6 cm (right > transverse > left), loss of haustra
- CT: useful to assess underlying disease

### Treatment
- NPO, NGT, stop constipating agents, correct fluid and electrolyte abnormalities, transfusion
- serial AXRs
- broad-spectrum antibiotics (reduce sepsis, anticipate perforation)
- aggressive treatment of underlying disease (e.g. steroids in IBD, metronidazole for C. difficile)
- indications for surgery (50% improve on medical management)
  • worsening or persisting toxicity or dilation after 48-72 h
  • severe hemorrhage, perforation
  • high lactate and WBC especially for C. difficile
- procedure: subtotal colectomy + end ileostomy (may be temporary, with second operation for re-anastomosis later)

### Prognosis
- average 25-30% mortality

## Fistula

### Definition
- abnormal communication between two epithelialized surfaces (e.g. enterocutaneous, colovesical, aortoenteric, entero-enteric)

### Etiology
- foreign object erosion (e.g. gallstone, graft)
- inflammatory states (e.g. infection, IBD [especially Crohn’s], diverticular disease)
- iatrogenic/surgery (e.g. post-operative anastomotic leak, radiation)
- congenital, trauma
- neoplastic

### Investigations
- U/S, CT scan, fistulogram
- measure amount of drainage from fistula

### Why Fistulae Stay Open
- FRIENDO
  - Foreign body
  - Radiation
  - Infection
  - Epithelialization
  - Neoplasm
  - Distal obstruction (most common)
  - Others: increased flow, steroids (may inhibit closure, usually will not maintain fistula)
Treatment
• decrease secretion: octreotide/somatostatin/omeprazole
• surgical intervention: dependent upon etiology (for non-closing fistulas); uncertainty of diagnosis

Stomas
Definition
• an opening of the GI tract onto the surface of the abdomen wall

Ileostomy
• usually positioned in RLQ; ileum is brought through rectus abdominus muscles
• indications: after proctocolectomy for ulcerative colitis, in some cases of Crohn’s disease or familial polyposis
• conventional ileostomy: discharges small quantities of liquid material continuously, appliance (plastic bag attached to a sheet of protective material) required at all times
• continent ileostomy: reservoir is constructed from distal ileum, emptied by inserting catheter into stoma several times a day; rarely used, has mostly been replaced by ileal pouch anal anastomosis

Colostomy
• indications: to decompress an obstructed colon, to protect a distal anastomosis after resection, or to evacuate stool after distal colon or rectum is removed
• colostomies can be done by making an opening in a loop of colon (loop colostomy) or by dividing the colon and bringing out one end (end colostomy)
• most common permanent colostomy is a sigmoid colostomy – expels stool once per day, no appliance required
• chronic paracolostomy hernia is a common complication

Complications (10%)
• obstruction: herniation, stenosis (skin and abdominal wall), adhesive bands, volvulus
• peri-ileostomy abscess and fistula
• skin irritation
• prolapse or retraction
• diarrhea (excessive output)

Hemorrhoids
Etiology
• vascular and connective tissue complexes form a plexus of dilated veins (cushion)
  ▪ internal: superior hemorrhoidal veins, above dentate line, portal circulation
  ▪ external: inferior hemorrhoidal veins, below dentate line, systemic circulation

Risk Factors
• increased intra-abdominal pressure: chronic constipation, pregnancy, obesity, portal HTN, heavy lifting
Clinical Features and Treatment
• internal hemorrhoids
  • engorged vascular cushions usually at 3, 7, 11 o'clock positions (patient in lithotomy position)
  • PAINLESS rectal bleeding, anemia, prolapse, mucus discharge, pruritus, burning pain, rectal fullness
    • 1st degree: bleed but do not prolapse through the anus
      – treatment: high fibre/bulk diet, sitz baths, steroid cream, parnixone (Anusol®), rubber band ligation, sclerotherapy, photocoagulation
    • 2nd degree: bleed, prolapse with straining, spontaneous reduction
      – treatment: rubber band ligation, photocoagulation
    • 3rd degree: bleed, prolapse, requires manual reduction
      – treatment: same as 2nd degree, but may require closed haemorroidectomy
    • 4th degree: bleed, permanently prolapsed, cannot be manually reduced
      – treatment: closed haemorroidectomy

  • external hemorrhoids
    • dilated venules usually mildly symptomatic
    • PAIN after bowel movement, associated with poor hygiene
    • medical treatment: dietary fibre, stool softeners, steroid cream (short course), parnixone (Anusol®), avoid prolonged straining
    • thrombosed hemorrhoids are very painful
    • resolve within 2 wk, may leave excess skin = perianal skin tag
    • treatment: consider surgical decompression within first 48 h of thrombosis, otherwise medical treatment

Anal Fissures

Definition
• tear of anal canal below dentate line (very sensitive squamous epithelium)
• 90% posterior midline, 10% anterior midline
• if off midline: consider other possible causes such as IBD, STIs, TB, leukemia, or anal carcinoma
• repetitive injury cycle after first tear
  • sphincter spasm occurs preventing edges from healing and leads to further tearing
  • ischemia may ensue and contribute to chronicity

Etiology
• forceful dilation of anal canal: large, hard stools and irritant diarrheal stools
• tightening of anal canal secondary to nervousness/pain leads to further tearing
• others: habitual use of cathartics, childbirth

Clinical Features
• acute fissure
  • very painful bright red bleeding especially after bowel movement, sphincter spasm on limited DRE
  • treatment is conservative: stool softeners, bulking agent, sitz baths (heals 90%)
• chronic fissure (anal ulcer)
  • triad: tissue, sentinel skin tags, hypertrophied papillae
  • treatment
    • stool softeners, bulking agents, sitz baths
    • topical nitroglycerin or nifedipine: increases local blood flow, promoting healing and relieves sphincter spasm
    • lateral internal anal sphincterotomy (most effective): objective is to relieve sphincter spasm  ➔ increases blood flow and promotes healing; but 5% chance of fecal incontinence therefore not commonly done
  • alternative treatment
    • botulinum toxin: inhibits release of acetylcholine (ACh), reducing sphincter spasm

Anorectal Abscess

Definition
• infection in one or more of the anal spaces
• usually bacterial infection of blocked anal gland at the dentate line
  • E. coli, Proteus, Streptococci, Staphylococci, Bacteroides, anaerobes
Figure 22. Different types of perianal abscesses

Clinical Features
- throbbing pain that may worsen with straining and ambulation
- abscess can spread vertically downward (perianal), vertically upward (supralevator), or horizontally (ischiorectal)
- tender perianal/rectal mass on exam

Treatment
- I&D
  - curative in 50% of cases
  - 50% develop anorectal fistulas
- may require antibiotics if diabetic, heart murmur, or cellulitis

Fistula-In-Ano

Definition
- anal fistula from rectum to perianal skin
- an inflammatory tract with internal os at dentate line, external os on skin

Etiology
- see Fistula, GS38
- same perirectal process as an anal abscess, therefore usually associated with an abscess
- other causes: post-operative, trauma, anal fissure, malignancy, radiation proctitis

Clinical Features
- intermittent or constant purulent discharge from perianal opening
- pain
- palpable cord-like tract

Treatment
- identification
  - internal opening
    - Goodsall’s rule
      - fistulas originating anterior to a transverse line through the anus will have a straight course and exit anteriorly, whereas those originating posterior to the transverse line will begin in the midline and have a curved tract
  - fistulous tract
    - probing or fistulography under anesthesia
- surgery
  - fistulotomy: unroof tract from external to internal opening, allow drainage, heals by secondary intention
  - low lying fistula (does not involve external sphincter) → primary fistulotomy
  - high lying fistula (involves external sphincter) → staged fistulotomy with Seton suture placed through tract
    - promotes drainage
    - promotes fibrosis and decreases incidence of incontinence
    - delineates anatomy
    - usually done to spare muscle cutting
Post-Operative
- sitz baths, irrigation, and packing to ensure healing proceeds from inside to outside

Complications
- recurrence
- rarely fecal incontinence

Pilonidal Disease

Definition
- chronic recurring abscess or chronic draining sinus in sacrococcygeal area

Epidemiology
- occurs most frequently in young men age 15-40 yr; rare in >50 yr

Etiology
- obstruction of the hair follicles in this area → formation of cysts, sinuses, or abscesses

Clinical Features
- asymptomatic until acutely infected, then pain/tenderness, purulent discharge, inspissated hair

Treatment
- acute abscess
  - I&D (often performed by primary care doctors)
  - wound packed open
  - 40% develop chronic pilonidal sinuses
- surgery
  - indication: failure of healing after I&D, recurrent disease, complex disease
    - pilonidal cystotomy: excision of sinus tract and cyst; wound closed by secondary intention, primary closure with tissue flap, or marsupialization (cyst edge sewn to surrounding tissue to leave sinus tract open)

Rectal Prolapse

Definition
- protrusion of some or all of rectal mucosa through external anal sphincter

Epidemiology
- extremes of ages: <5 yr old and >5th decade
- 85% women

Etiology
- lengthened attachment of rectum secondary to constant straining
- 2 types
  I. false/partial/mucosal: protrusion of mucosa only, radial furrows at junction with anal skin; most common type of rectal prolapse in childhood
  II. true/complete (most common): full thickness extrusion of rectal wall, concentric folds in:
    - first degree: prolapse includes mucocutaneous junction
    - second degree: without involvement of mucocutaneous junction
    - third degree (internal intussusception): prolapse is internal, concealed, or occult

Risk Factors
- gynecological surgery
- chronic neurologic/psychiatric disorders affecting motility

Clinical Features
- extrusion of mass with increased intra-abdominal pressure
  - straining, coughing, laughing, Valsalva
  - difficulty in bowel regulation
  - tenesmus, constipation, fecal incontinence
  - permanently extruded rectum with excoriation, ulceration, and constant soiling
  - may be associated with urinary incontinence or uterine prolapse

Treatment
- Type I
  - conservative: gentle manual reduction of prolapsed area, especially in children
  - mucosectomy with excision of redundant mucosa, mostly in adults
- Type II
  - conservative: reduce if possible
  - surgery: abdominal, perineal, transsacral approaches
**Anal Neoplasms**

**ANAL CANAL**

* Squamous Cell Carcinoma of Anal Canal (Above Dentate Line)*
  - most common tumour of anal canal (75%)
  - anus prone to human papillomavirus (HPV) infection, therefore at risk for anal squamous intra-epithelial lesions (ASIL)
    - high grade squamous intra-epithelial lesion (HSIL) and low grade squamous intra-epithelial lesion (LSIL) terminology used
  - clinical features: anal bleeding, pain, mass, ulceration, pruritus; 25% asymptomatic
  - treatment: chemotherapy ± radiation ± surgery
  - prognosis: 80% 5-yr survival

*Malignant Melanoma of Anal Canal*
  - 3rd most common site for primary malignant melanoma after skin, eyes
  - aggressive, distant metastases common at time of diagnosis
  - treatment: wide excision or APR ± chemoradiation
  - prognosis: <5% 5 yr survival

**ANAL MARGIN**
  - clinical features and treatment as for skin tumours elsewhere
  - squamous and basal cell carcinoma, Bowen's disease (SCC in situ), and Paget's disease

---

**Liver**

**Liver Cysts**

Figure 26. Anatomy of liver
Liver Abscesses

Etiology
- **types**
  - pyogenic (bacterial): most common etiology; most often polymicrobial – *E. coli*, *Klebsiella*, *Proteus*, *Strep. milleri*
  - parasitic (amoebic): *Entamoeba histolytica*, *Echinococcal cyst*
  - fungal: *Candida*
- sources: direct spread from biliary tract infection, portal spread from GI infection, systemic infection (e.g. endocarditis)

Clinical Features
- fever, malaise, chills, anorexia, weight loss, abdominal pain, nausea
- RUQ tenderness, hepatomegaly, jaundice

Investigations
- leukocytosis, anemia, elevated liver enzymes, hemagglutination titres for *Entamoeba* antibodies
- U/S, CXR (right basilar atelectasis/effusion), CT, cyst aspiration with C&S

Treatment
- treat underlying cause
- generally will treat initially with antibiotics alone, and add surgical or percutaneous drainage and IV antibiotics for larger abscesses (initially ceftriaxone + metronidazole or piperacillin/tazobactam)

Prognosis
- overall mortality 15% – higher rate if delay in diagnosis, multiple abscesses, malnutrition

Neoplasms

BENIGN LIVER NEOPLASMS

Hemangioma (cavernous)
- pathogenesis: most common benign hepatic tumour; results from malformation of angioblastic fetal tissue
- risk factors: F:M = 3:1
• clinical features
  - usually small and asymptomatic
  - consumptive coagulopathy if giant (in children)
• investigations
  - contrast CT (well-demarcated hypodense mass with peripheral enhancement and delayed venous emptying), U/S (homogenous hyperechoic mass), arteriography (rarely used; “cotton wool" appearance), MRI
  - avoid biopsy: may result in hemorrhage
• treatment
  - usually none unless tumour bleeds or is symptomatic, then excision by lobectomy or enucleation

Focal Nodular Hyperplasia
• pathogenesis: unclear, may be regenerative response to hyperperfusion from anomalous arteries at centre of nodule
• risk factors: female, age 20-50
• clinical features: asymptomatic, rarely grows or bleeds, no malignant potential
• investigations: central stellate scar on CT scan; MRI, biopsy may be required
• treatment: may be difficult to distinguish from adenoma/fibrolamellar HCC (malignant potential) → often resected

Adenoma
• definition: benign glandular epithelial tumour
• risk factors: female, age 20-50, estrogen (OCP, pregnancy)
• clinical features: asymptomatic, 25% present with RUQ pain or mass, may present with bleeding
• investigations: CT (well-demarcated masses, often heterogeneous enhancement on arterial phase, isodense on venous phase without washout of contrast), U/S, MRI, biopsy often needed
• treatment
  - stop anabolic steroids or OCP
  - excise, especially if large (>5 cm), due to risk of transformation to hepatocellular carcinoma and spontaneous rupture/hemorrhage

MALIGNANT LIVER NEOPLASMS
Primary
• usually hepatocellular carcinoma (HCC)/hepatoma
• others include angiosarcoma, hepatoblastoma, hemangiendothelioma
• epidemiology: 3rd leading cause of cancer death worldwide, 9th in United States; highest in Africa, China, Taiwan
• risk factors
  - chronic liver inflammation: chronic hepatitis B (inherently oncogenic) and hepatitis C, cirrhosis (especially macronodular), hemochromatosis, α1-antitrypsin deficiency
  - medications: OCPs (3x increased risk), steroids
  - smoking, alcohol, Betel nuts
  - chemical carcinogens ( aflatoxin, microcystin, vinyl chloride – associated with angiosarcoma)
• clinical features
  - RUQ discomfort, right shoulder pain
  - jaundice, weakness, weight loss, ± fever (if central tumour necrosis)
  - hepatomegaly, bruist, hepatic friction rub
  - ascites with blood (sudden intra-abdominal hemorrhage)
  - paraneoplastic syndromes – hypoglycemia, hypercalcemia, erythrocytosis, watery diarrhea
  - metastasis: lung, bone, brain, peritoneal seeding
• investigations
  - elevated ALP, bilirubin, and α-fetoprotein (80% of patients)
  - U/S (poorly-defined margins with internal echos), triphasic CT (enhancement on arterial phase and washout on portal venous phase), MRI
  - liver enzyme and liver function tests: AST, ALT, ALP, bilirubin, albumin, INR
• treatment
  - cirrhosis is a relative contraindication to tumour resection due to decreased hepatic reserve
  - surgical: resection (10% of patients have resectable tumours)
  - liver transplant; may use bridging therapy while awaiting transplant
• absolute contraindications: extrahepatic disease, vascular invasion
• relative contraindications: dependent on liver transplant protocol based on staging criteria followed by transplant centre
• non-surgical: radiofrequency ablation, percutaneous ethanol injection, transcatheter arterial chemoembolization (TACE), chemotherapy (consider sorafenib for HCC; pre-operative chemotherapy for hepatoblastoma is standard of care), radiotherapy
Secondary

- metastases to the liver are the most common malignant tumours found in the liver
- etiology
  - GI (colorectal most common), lung, breast, pancreas, ovary, uterus, kidney, gallbladder, prostate
- treatment
  - hepatic resection for metastatic colorectal liver metastases if control of primary is possible, no extrahepatic or extrapulmonary metastases and if possibility of “curative” resection
  - possible chemotherapy
- prognosis: 30-40% 5 yr survival with a “curative” resection; prognosis same if metastases are multilobar compared with confined to one lobe

*leading cause in adults; **leading cause in children

Clinical Indications

- early referral for transplant should be considered for all patients with progressive liver disease not responsive to medical therapy, especially:
  - decompensated cirrhosis (ascites, esophageal variceal hemorrhage, spontaneous hepatic encephalopathy, coagulopathy, progressive jaundice, severe fatigue)
  - unresectable primary liver cancers
  - fulminant hepatic failure
  - end-stage liver disease with life expectancy <1 yr and if no other therapy is appropriate

Criteria for Transplantation

- Model for End-Stage Liver Disease (MELD); prognostic model to estimate 3 mo survival and disease severity if patient does not receive transplant; based on creatinine, bilirubin, INR; MELD scores from 6–40 used to prioritize liver allocation
- Child-Turcotte-Pugh Score: classification system to assess the prognosis and mortality of liver disease; patient must have ≥7 points (Class B)

Contraindications

- active alcohol/substance abuse
- extrahepatic malignancy within 5 yr
- advanced cardiopulmonary disease
- active uncontrolled infection

Post-Operative Complications

- primary non-function (graft failure); urgent re-transplantation is indicated
- acute and chronic rejection, ischemia-reperfusion injury
- vascular: hepatic artery or portal vein thrombosis, IVC obstruction
- biliary complications: fever, increasing bilirubin and ALP
- complications related to immunosuppression: HTN, renal disease, DM, obesity, hyperlipidemia, osteoporosis, malignancy, neurologic complications, infection (leading cause of mortality following transplant)

Prognosis

- patient survival at 1 yr: 85%
- graft survival at 1 yr: >80%, at 5 yr: 60-70%
Biliary Tract

Cholelithiasis

Definition
• the formation of gallstones

Pathogenesis
• imbalance of cholesterol and its solubilizing agents (bile salts and lecithin)
• excessive hepatic cholesterol secretion → bile salts and lecithin are “overloaded” → supersaturated cholesterol can precipitate and form gallstones
• North America: cholesterol stones (80%), pigment stones (20%)

Risk Factors
• cholesterol stones
  ▪ obesity, age <50
  ▪ estrogens: female, multiparity, OCPs
  ▪ ethnicity: First Nations heritage (especially Pima Indians) > Caucasian > Black
  ▪ terminal ileal resection or disease (e.g. Crohn’s disease)
  ▪ impaired gallbladder emptying: starvation, TPN, DM
  ▪ rapid weight loss: rapid cholesterol mobilization and biliary stasis
• pigment stones (contain calcium bilirubinate)
  ▪ cirrhosis
  ▪ chronic hemolysis
  ▪ biliary stasis (strictures, dilation, biliary infection)
• protective factors: statins, vitamin C, coffee, exercise

Figure 27. Gallstone disease

Clinical Presentation
• asymptomatic (80%)
  ▪ most do NOT require treatment
  ▪ consider cholecystectomy if: increased risk of malignancy (choledochal cysts, Caroli’s disease, porcelain or calcified gallbladder), sickle cell disease, pediatric patient, bariatric surgery, immunosuppression
• biliary colic (10-25%)
• cholecystitis
• choledocholithiasis (8-15%)
• cholangitis
• gallstone pancreatitis (see Acute Pancreatitis, GS52)
• gallstone ileus (0.3-0.5%)
• other: empyema of the gallbladder, liver abscess, gallbladder perforation with bile peritonitis

Investigations
• Labs
  ▪ CBC, LFTs, amylase, and lipase
U/S: diagnostic procedure of choice
- image for signs of inflammation, obstruction, localization of stones
- 95% specific for detecting stones
- signs: gallbladder wall thickening >4 mm, edema (double-wall sign), gallbladder sludge, pericholecystic fluid, sonographic Murphy's sign
- ERCP
  - visualization of upper GI tract, ampullary region, biliary and pancreatic ducts
  - method for treatment of CBD stones in periampullary region
- complications: traumatic pancreatitis (1-2%), pancreatic or biliary sepsis

MRCP
- same information gained as ERCP but non-invasive
- cannot be used for therapeutic purposes
- PTC
  - injection of contrast via needle passed through hepatic parenchyma
  - useful for proximal bile duct lesions or when ERCP fails or not available
  - requires prophylactic antibiotics
- contraindications: coagulopathy, ascites, peri/intrahepatic sepsis, disease of right lower lung or pleura
- complications: bile peritonitis, chylothorax, pneumothorax, sepsis, hemobilia
- HIDA scan
  - used less commonly
  - radioisotope technetium-99 injected into a vein is excreted in high concentrations into bile, allowing visualization of the biliary tree
  - does not visualize stones; diagnosis by seeing occluded cystic duct or CBD

### Biliary Colic

**Pathogenesis**
- gallstone transiently impacted in cystic duct, no infection

**Clinical Features**
- steady, severe dull pain in epigastrium or RUQ for minutes to hours, crescendo-decrescendo pattern
- may present with chest pain
- N/V
- frequently occurs at night or after fatty meal, not after fasting
- can radiate to right shoulder or scapula
- patients often restless
- no peritoneal findings, no systemic signs

**Investigations**
- normal blood work: CBC, electrolytes, LFTs, bilirubin, amylase
- U/S shows cholelithiasis, may show stone in cystic duct

**Treatment**
- analgesia, rehydration during colic episode
- elective cholecystectomy (95% success)
  - complications: CBD injury (0.3-0.5%), hollow viscus injury, bile peritonitis, vessel injury
  - laparoscopic cholecystectomy is the standard of care, no benefit to delaying surgery
  - risk of open cholecystectomy higher in emergency situations

**Acute Cholecystitis**

**Pathogenesis**
- inflammation of gallbladder resulting from sustained gallstone impaction in cystic duct or Hartmann's pouch
- no cholelithiasis in 5-10% (see Acalculous Cholecystitis, GS49)

**Clinical Features**
- often have history of biliary colic
- severe constant (hours to days) epigastric or RUQ pain, anorexia, N/V, low grade fever (<38.5°C)
- focal peritoneal findings: Murphy's sign, palpable, tender gallbladder (in 33%)
- Boas' sign: right subscapular pain

**Investigation**
- blood work: elevated WBC and left shift, mildly elevated bilirubin, AST, ALT, and ALP
- U/S: 98% sensitive, consider HIDA scan if U/S negative

**Complications**
- gallbladder mucocele (hydrops): long-term cystic duct obstruction results in mucous accumulation in gallbladder (clear fluid)
- gangrene (20%), perforation (2%): result in abscess formation or peritonitis
- empyema of gallbladder: suppurative cholecystitis, pus in gallbladder + sick patient
• cholecystoenteric fistula, from repeated attacks of cholecystitis, can lead to gallstone ileus
• emphysematous cholecystitis: bacterial gas present in gallbladder lumen, wall, or pericholecystic space (risk in diabetic patient)
• organisms involved in secondary infection: *E. coli, Klebsiella, Enterococcus*
• Mirizzi syndrome: extra-luminal compression of CBD/CHD due to large stone in cystic duct

**T**reatment
- admit, hydrate, NPO, NGT (if persistent vomiting from associated ileus), analgesics once diagnosis is made
- antibiotics
  - cefazolin if uncomplicated cholecystitis
- cholecystectomy
  - early (within 72 h) vs. delayed (after 6 wk)
    - equal morbidity and mortality
    - early cholecystectomy preferred: shorter hospitalization and recovery time, no benefit to delaying surgery
  - emergent OR indicated if high risk, e.g. emphysematous
    - laparoscopic: reduced risk of wound infections, shorter hospital stay, reduced post-operative pain, increased risk of bile duct injury
- intra-operative cholangiography (IOC)
  - indications: clarify bile duct anatomy, obstructive jaundice, history of biliary pancreatitis, small stones in gallbladder with a wide cystic duct (>15 mm), single faceted stone in gallbladder, bilirubin >137 µmol/L
- percutaneous cholecystostomy tube: critically ill or if general anesthetic contraindicated

## Acalculous Cholecystitis

**Definition**
- acute or chronic cholecystitis in the absence of stones

**Pathogenesis**
- typically due to gallbladder ischemia, stasis

**Risk Factors**
- DM, immunosuppression, ICU admission, trauma patient, TPN, sepsis

**Clinical Features**
- see Acute Cholecystitis, GS48
- occurs in 20% of cases of acute cholecystitis

**Investigations**
- U/S: shows sludge in gallbladder, other U/S features of cholecystitis (see Acute Cholecystitis, GS48)
- CT or HIDA scan

**Treatment**
- broad-spectrum antibiotics, cholecystectomy
- if patient unstable → cholecystostomy

## Choledocholithiasis

**Definition**
- stones in CBD

**Clinical Features**
- 50% asymptomatic
- often have history of biliary colic
- tenderness in RUQ or epigastrium
- acholic stool, dark urine, fluctuating jaundice
- primary vs. secondary stones
  - primary: formed in bile duct, indicates bile duct pathology (e.g. benign biliary stricture, sclerosing cholangitis, choledochal cyst, CF)
  - secondary: formed in gallbladder (85% of cases in U.S.)

**Investigations**
- CBC: usually normal; leukocytosis suggests cholangitis
- LFTs: increased AST, ALT early in disease, increased bilirubin (more sensitive), ALP, GG later
- amylase/lipase: to rule out gallstone pancreatitis
- U/S: intra-/extra-hepatic duct dilatation; differential diagnosis is choledochal cyst
- ERCP, PTC
- MRCP (90% sensitive, almost 100% specific, not therapeutic)
Complications
• cholangitis, pancreatitis, biliary stricture, and biliary cirrhosis

Treatment
• if no evidence of cholangitis: treat with ERCP for CBD stone extraction possibly followed by elective cholecystectomy in 25% of patients

Acute Cholangitis

Pathogenesis
• obstruction of CBD leading to biliary stasis, bacterial overgrowth, suppuration and biliary sepsis — may be life-threatening, especially in elderly

Etiology
• choledocholithiasis (60%), stricture, neoplasm (pancreatic or biliary), extrinsic compression (pancreatic pseudocyst or pancreatitis), instrumentation of bile ducts (PTC, ERCP), biliary stent
• organisms: E. coli, Klebsiella, Pseudomonas, Enterococcus, B. fragilis, Proteus

Clinical Features
• Charcot’s triad: fever, RUQ pain, jaundice
• Reynold’s pentad: fever, RUQ pain, jaundice, shock, confusion
• may have N/V, abdominal distention, ileus, acholic stools, tea-coloured urine (elevated direct bilirubin)

Investigations
• CBC: elevated WBC + left shift
• may have positive blood cultures
• LFTs: obstructive picture (elevated ALP, GGT, and conjugated bilirubin, mild increase in AST, ALT)
• amylase/lipase: rule out pancreatitis
• U/S: intra-/extra-hepatic duct dilatation

Treatment
• initial: NPO, fluid and electrolyte resuscitation, ± NGT, IV antibiotics (treats 80%)
• biliary decompression
  ▪ ERCP + sphincterotomy: diagnostic and therapeutic
  ▪ PTC with catheter drainage: if ERCP not available or unsuccessful
  ▪ laparotomy with CBD exploration and T-tube placement if above fails
• all patients should also have a cholecystectomy, unless contraindicated

Prognosis
• suppurative cholangitis mortality rate: 50%

Gallstone Ileus

Pathogenesis
• repeated inflammation causing a cholecystoenteric fistula (usually duodenal) → large gallstone enters the gut and impacts at or near the ileocecal valve, causing a true bowel obstruction (note: ileus is a misnomer in this context)

Clinical Features
• crampy abdominal pain, N/V (see Large Bowel Obstruction, GS30)

Investigations
• AXR: dilated small intestine, air fluid levels, may reveal radiopaque gallstone, air in biliary tree (pneumobilia) (40%)
• CT: biliary tract air, obstruction, gallstone in intestine
• Rigler’s triad: pneumobilia (air in biliary tree), small bowel obstruction (partial or complete), gallstone (usually in right iliac fossa)

Treatment
• fluid resuscitation, NGT decompression
• surgery: enterolithotomy and removal of stone, inspect small and large bowel for additional proximal stones
• may close fistula surgically or manage expectantly (can resolve spontaneously)
• cholecystectomy either during enterolithotomy or after recovery if patient experiences gallbladder symptoms

Charcot’s Triad
Fever, RUQ pain, jaundice

Reynold’s Pentad
Fever, RUQ pain, jaundice, shock, confusion

Common Bacteria in Biliary Tract
KEEPS
Klebsiella
Enterococcus
E. coli, Enterobacter
Proteus, Pseudomonas
Serratia

Rigler’s Triad of Gallstone Ileus
• Pneumobilia
• Small bowel obstruction
• Gallstone

Bouveret’s Syndrome
Gastric outlet/duodenal obstruction caused by a large gallstone passing through a cholecystogastric or cholecystoduodenal fistula
Carcinoma of the Gallbladder

Risk Factors
- chronic symptomatic gallstones (70% of cases), old age, female, gallbladder polyps, porcelain gallbladder, chronic infection (Salmonella, Helicobacter), abnormal pancreaticobiliary duct junction

Clinical Features
- majority are adenocarcinoma
- may be incidental finding on elective cholecystectomy (~1% of elective cholecystectomies)
- many patients are asymptomatic until late
- local: non-specific RUQ pain, ± palpable RUQ mass
- Courvoisier’s gallbladder: an enlarged, often palpable gallbladder in a patient with carcinoma of the head of the pancreas; associated with jaundice due to obstruction of the CBD
- systemic: jaundice (50%) due to invasion of CBD or compression of CBD by pericholedochal nodes, weight loss, malaise, anorexia
- early local extension to liver, may extend to stomach, duodenum
- early metastasis common to liver, lung, bone

Investigations
- U/S: mural thickening, calcification, loss of interface between gallbladder and liver, fixed mass
- endoscopic U/S (EUS): good for distinguishing carcinomas from other diagnoses such as polyps, good for staging, allows sampling of bile for cytology
- abdominal CT: polypoid mass, mural thickening, liver invasion, nodal involvement, distant metastases
- MRI/MRCP: good for distinguishing benign and malignant polyps

Treatment
- if carcinoma of the gallbladder is suspected pre-operatively, an open cholecystectomy should be considered to avoid tumour seeding of the peritoneal cavity
- confined to mucosa (rare): cholecystectomy
- beyond mucosa: cholecystectomy, en bloc wedge resection of 3-5 cm underlying liver, dissection of hepaticoduodenal lymph nodes

Prognosis
- poor 5 yr survival (10%) as gallbladder carcinoma is often detected late
- better outcomes when detected incidentally following cholecystectomy

Cholangiocarcinoma

Definition
- malignancy of extra- or intrahepatic bile ducts

Risk Factors
- age 50-70, gallstones, ulcerative colitis, primary sclerosing cholangitis, choledochal cyst, Clonorchis sinensis infection (liver fluke), chronic intrahepatic stones (hepatolithiasis)

Clinical Features
- majority are adenocarcinomas
- gradual signs of biliary obstruction: jaundice, pruritus, dark urine, pale stools
- anorexia, weight loss, RUQ pain, Courvoisier’s sign (if CBD obstructed), hepatomegaly
- early metastases are uncommon, but commonly tumour grows into portal vein or hepatic artery
- Klatskin tumour: cholangiocarcinoma located at bifurcation of common hepatic duct

Investigations
- LFTs show obstructive picture
- U/S, CT: bile ducts usually dilated, but not necessarily
- ERCP or PTC: to determine resectability, for biopsies
- CXR, bone scan: for metastatic workup

Treatment
- if resectable: biliary drainage and wide excision margin
  - upper third lesions: duct resection + Roux-en-Y hepaticojejunostomy, ± liver resection
  - middle third lesions (uncommon): duct resection + Roux-en-Y hepaticojejunostomy
  - lower third lesions: Whipple procedure
- unresectable lesions: stent or choledochojejunostomy (surgical bypass)
- chemotherapy ± radiotherapy
- role for transplantation in some patients with Klatskins tumours

Prognosis
- radiotherapy useful for additional palliation, chemotherapy may be helpful
- the more proximal to the liver, the worse the prognosis
- overall 5 yr survival: 15%

Prognosis

Courvoisier’s Sign
Palpable, nontender distended gallbladder due to CBD obstruction. Present in 33% of patients with pancreatic carcinoma. The distended gallbladder could not be due to acute cholecystitis or stone disease because the gallbladder would actually be scarred and smaller, not larger

Efficacy of Neoadjuvant Chemoradiation, Followed by Liver Transplantation, for Perihilar Cholangiocarcinoma at 12 US Centers
Gastroenterology 2012;143:88-96
Purpose: To determine the effectiveness of neoadjuvant chemoradiation and liver transplantation for unresectable perihilar cholangiocarcinoma and to determine the appropriateness of the United Network of Organ Sharing/Organ Procurement and Transportation Network (UNOS/GPRTN) criteria for model of end-stage liver disease (MELD) exception for patients with this disease.
Methods: Study conducted from 1993-2010 in 12 transplant centers. 287 patients included.
Results: Median follow-up was 2.5 yr; 40% of patients (n=112) died after a median of 1.2 yr from presentation, and of these, 65 died pretransplant. Post-transplant, 40 patients had recurrence and 62 died. Recurrence-free survival at 2, 5, and 10 yrs were 76%, 65%, and 56%, respectively. Intention-to-treat survival rates at 2 and 5 yrs were 66% and 53%, respectively. 23% of patients left the waiting list after a median of 4.6 mo. The waiting list drop-out rate increased by an average of 11.5% every 3 mo. Patients who received transplantation outside of the criteria for MELD exception or who had a malignancy within 3 yr had significantly worse recurrence-free survival compared to those who met the criteria (HR=1.59, 95%CI 1.26, 1.95). Recurrence-free survival at 5 yr was shorter for patients with tumours >3 cm (HR=3; p<0.001).
Conclusions: Neoadjuvant chemoradiation and liver transplantation are effective treatments for unresectable perihilar cholangiocarcinoma. Furthermore, the UNOS/GPRTN criteria for MELD exception appear to be appropriate.

Obstructive jaundice is the most common presenting symptom for cholangiocarcinoma

Ranson’s Criteria
A. At admission
1. Age >55 yr
2. WBC >16 x 10^9/L
3. Glucose >11 mmol/L
4. LDH ≥350 IU/L
5. AST ≥250 IU/L
B. During initial 48 h
1. Hct drop >10%
2. BUN rise >1.8 mmol/L
3. Arterial PO2 <60 mmHg
4. Base deficit >4 mmol/L
5. Calcium <2 mmol/L
6. Fluid sequestration >6 L
C. Interpretation
≥2 = difficult course
≥3 = high mortality (>15%)
Pancreas

Acute Pancreatitis

- see Gastroenterology, G44

GALLSTONE PANCREATITIS (35% of Acute Pancreatitis)

Pathogenesis
- obstruction of pancreatic duct by large or small gallstones and biliary sludge
- backup of pancreatic enzymes can cause autodigestion of the pancreas

Clinical Features (Pancreatitis of Any Etiology)
- pain (epigastric pain radiating to back), N/V, ileus, peritoneal signs, jaundice, fever
- Inglefinger's sign: pain worse when supine, better when sitting forward
- rarely may have coexistent cholangitis or pancreatic necrosis
- Ranson's criteria for determining prognosis of acute pancreatitis (see sidebar)
- physical exam may show: tachypnea, tachycardia, hypotension, abdominal distention and tenderness, Cullen's sign, Grey Turner's sign

Investigations
- high amylase (higher than alcoholic pancreatitis), lipase, leukocytosis
- elevated ALT (>150 IU/L), AST strongly suggest gallstone etiology of pancreatitis
- U/S may show multiple stones (may have passed spontaneously), edematous pancreas
- CXR, AXR, CT (if severe to evaluate for complications)

Treatment
- supportive: e.g. NPO, hydration, analgesia, early enteric nutrition
- antibiotics for severe cases of necrotizing pancreatitis or signs of sepsis
- stone often passes spontaneously (~90%); usually no surgical management in uncomplicated acute pancreatitis
- cholecystectomy during same admission (25-60% recurrence if no surgery)
- may need urgent ERCP + sphincterotomy if failure of conservative management if stone impacted in CBD (benefits of early ERCP controversial)
- early ERCP if concomitant cholangitis
- **surgical indications** in acute pancreatitis (rare):
  - debridement and drain placement for necrotizing pancreatitis if refractory to medical management, if septic or in ICU without other sources of sepsis

Complications
- pseudocyst (collection of pancreatic secretions >4 wk old surrounded by a defined wall of granulation tissue)
- abscess/infection, necrosis
- splenic/mesenteric/portal vessel thrombosis or rupture
- pancreatic ascites/pancreatic pleural effusion
- DM
- ARDS/sepsis/multiorgan failure
- coagulopathy/DIC
- encephalopathy
- severe hypocalcemia

Chronic Pancreatitis

- see Gastroenterology, G46

Surgical Treatment
- treatment is generally medical
- indications for surgery
  - failure of medical treatment
  - debilitating abdominal pain
  - pseudocyst complications: persistence, hemorrhage, infection, rupture
  - CBD obstruction (e.g. strictures), duodenal obstruction
  - pancreatic fistula, variceal hemorrhage secondary to splenic vein obstruction
  - rule out pancreatic cancer (present in 15% of chronic pancreatitis treated surgically)
  - anatomical abnormality causing recurrent pancreatitis
- pre-operative CT and/or ERCP are mandatory to delineate anatomy
- minimally invasive options
  - endoscopic pancreatic duct decompression: less effective than surgery
  - extracorporeal shockwave lithotripsy: if pancreatic duct stones
  - celiac plexus block: lasting benefit in 30% patients, less effective in those <45 yr or with prior pancreatic surgery

The hallmark of chronic pancreatitis is epigastric pain radiating to the back
**Surgical Options**
- Drainage procedures: only effective if ductal system is dilated
  - Puestow procedure (lateral pancreaticojejunostomy): improves pain in 80% of patients
  - Pancreatectomy: best option in absence of dilated duct
  - Proximal disease: Whipple procedure (pancreatoduodenectomy) – pain relief in 80%
  - Distal disease: distal pancreatectomy ± Roux-en-Y pancreaticojejunostomy
  - Total pancreatectomy: refractory disease
  - Denervation of celiac ganglion and splanchnic nerves

**Pseudocyst**
- Localized fluid collections rich in pancreatic enzymes, with a non-epithelialized wall consisting of fibrous and granulation tissue
- Complication of chronic and/or acute pancreatitis
- Often resolve spontaneously
- Cyst wall must be mature prior to drainage (4-6 wk)
- Pseudoaneurysm an absolute contraindication to endoscopic drainage, must embolize first

**Treatment**
- Surgical drainage (gold standard)
  - Cystgastrostomy
  - Cystenterostomy
  - Resection
- Endoscopic drainage
  - Cystgastrostomy
  - Cystduodenostomy
  - Percutaneous catheter drainage
- Consider biopsy of cyst wall to rule out cystadenocarcinoma

**Pancreatic Cancer**

**Epidemiology**
- Fourth most common cause of cancer-related mortality in both men and women in Canada
- M:F = 1.3:1, average age: 50-70

**Risk Factors**
- Increased age
- Smoking: 2-5x increased risk, most clearly established risk factor
- High fat/low fibre diets, heavy alcohol use
- Obesity
- DM, chronic pancreatitis
- Partial gastrectomy, cholecystectomy
- Chemicals: betanaphthylamine, benzidine
- African descent

**Clinical Features**
- Head of the pancreas (70%)
  - Weight loss, obstructive jaundice, steatorrhea, vague constant mid-epigastric pain (often worse at night, may radiate to back)
  - Painless jaundice (occurs more often with peri-ampullary), Courvoisier’s sign (see sidebar GS49)
- Body or tail of pancreas (30%)
  - Tends to present later and usually inoperable
  - Weight loss, vague mid-epigastric pain
  - <10% jaundiced
  - Sudden onset DM

**Investigations**
- Serum chemistry is non-specific, can have elevated ALP and bilirubin >300 µmol/L
- CA 19-9 (most useful serum marker of pancreatic cancer)
- U/S, contrast CT (also evaluates metastasis and resectability), ERCP, MRI, MRCP

**Pathology**
- Ductal adenocarcinoma: most common type (75-80%); exocrine pancreas
- Intraductal papillary mucinous neoplasm (IPMN)
- Other: pancreatic neuroendocrine tumours (non-functional, insulinoma, gastrinoma, VIPoma, glucagonoma, somatostatinoma), mucinous cystic neoplasm (MCN), acinar cell carcinoma
- See Surgical Endocrinology, GS61 for functional pancreatic neuroendocrine tumours

**Treatment**
- Resectable (10-20% of pancreatic cancer)
  - No involvement of liver, peritoneum, or vasculature (hepatic artery, SMA, SMV, portal vein, IVC, aorta), no distant metastasis
  - Whipple procedure (pancreatoduodenectomy) for cure <5% mortality
  - Distal pancreatectomy ± splenectomy, lymphadenectomy if carcinoma of midbody and tail of pancreas

**Pancreatic Neuroendocrine Tumours**
- Exocrine pancreas
- Insulinoma
- Gastrinoma
- Glucagonoma
- Somatostatinoma
- See Surgical Endocrinology, GS61 for functional pancreatic neuroendocrine tumours

**Steps of a Whipple Resection**
1. Assessment of metastatic disease (all peritoneal surfaces)
2. Mobilization of the duodenum and head of the pancreas
3. Identification of the superior mesenteric vein and mobilization of the pancreatic neck
4. Mobilization of the stomach; dissection of the hepatoduodenal ligament and cholecystectomy
5. Division of the stomach, proximal jejunum, and CBD
6. Transection of the pancreatic neck and dissection of the uncinate process from the retroperitoneum
7. Restoration of gastrointestinal continuity; construction of a pancreaticojejunostomy, hepatojejunostomy, gastrojejunostomy using a neoduodenum

**Removed**
- CBD
- Gallbladder
- Duodenum
- Pancreatic head
- Distal stomach (sometimes)
- borderline resectable
  - tumours that abut the SMA, SMV, portal vein, hepatic artery, or celiac artery
- non-resectable (palliative → relieve pain, obstruction)
  - most body/tail tumours are not resectable (due to late presentation)
  - relieve biliary/duodenal obstruction with endoscopic stenting or double bypass procedure (choledochoenterostomy + gastroenterostomy)
  - chemotherapy (gemcitabine, folfirinox), radiotherapy – only slightly increase survival

**Prognosis**
- most important prognostic indicators are lymph node status, margin status, size >3 cm, perineural invasion (invasion of tumour into microscopic nerves of pancreas)
- overall 5 yr survival for all patients with pancreas cancer is 1%; following surgical resection 5 yr survival is 20%
- median survival for unresectable disease: 3-6 mo if metastatic, 8-12 mo if locally advanced at presentation

**Diagnostic Value of Serum Carbohydrate Antigen 19-9 in Pancreatic Cancer: A Meta-Analysis**

*Summary:* 11 studies with 2,316 patients were included in the analysis. The sensitivity of CA19-9 in the diagnosis of pancreatic cancer was found to be 0.8 (95% CI 0.77-0.82) and the specificity also 80% (95% CI 0.77-0.82) with a diagnostic odds ratio of 14.79 (95% CI 8.55-25.59). Overall, CA19-9 plays an important role in the diagnosis of pancreatic cancer.
Spleen

Splenic Trauma

- typically from blunt trauma (especially in people with splenomegaly)
- most common intra-abdominal organ injury in blunt trauma
- may have Kehr’s sign

Treatment

- non-operative
  - in stable patients: extended bed rest with serial hematocrit levels, close monitoring for 3-5 d; pediatric guidelines for days of bed rest is grade plus 1 (i.e. grade 3 splenic laceration requires 4 d of bed rest)
  - hemostatic control
  - splenic artery embolization if patient stable and one of: active contrast extravasation, splenic pseudoaneurysm, hemoperitoneum
- operative
  - splenorrhaphy (suture of spleen) ± splenic wrapping with hemostatic mesh – if patient hemodynamically stable, patient has stopped bleeding and laceration does not involve hilum
  - partial splenectomy, rarely performed due to risk of recurrent hemorrhage
  - total splenectomy if patient unstable or high-grade injury

Splenectomy

Indications

- splenic trauma (most common reason for splenectomy), hereditary spherocytosis, primary hypersplenism, chronic immune thrombocytopenic purpura (ITP), splenic vein thrombosis causing esophageal varices, splenic abscess, thrombotic thrombocytopenic purpura (TTP), sickle cell disease
- does not benefit all thrombocytopenic states (e.g. infection, most malignancies involving the bone marrow, drugs/toxins)
- probability of cure of ITP by splenectomy is 60-70%, may be predicted by response to IVIg

Complications

- short-term
  - injury to surrounding structures (e.g. gastric wall, tail of pancreas)
  - post-operative thrombocytosis, leukocytosis
  - thrombosis of portal, splenic, or mesenteric veins
  - subphrenic abscess
- long-term
  - post-splenectomy sepsis (encapsulated organisms): 4% of splenectomized patients (highest risk in those <16 yr old)
    - 50% mortality
    - prophylaxis with vaccinations, ideally 2 wk pre- or post-operative (pneumococcal, H. influenzae, and meningococcus)
    - liberal use of penicillin especially in children <6 yr old
  - splenosis: intra-abdominal “seeding” of splenic tissue during removal
Benign Breast Lesions

Three Categories
1. nonproliferative
2. proliferative without atypia
3. atypical hyperplasia

NONPROLIFERATIVE LESIONS
- benign breast condition characterized by fibrous and cystic changes in the breast
- most common: breast cysts
- other lesions include papillary apocrine change, epithelial-related calcifications and mild hyperplasia of the usual type
- no increased risk of breast cancer
- age 30 to menopause (and after if HRT used)
- clinical features
  - breast pain, focal areas of nodularity or cysts often in the upper outer quadrant, frequently bilateral, mobile, varies with menstrual cycle, nipple discharge (straw-like, brown, or green)
- treatment
  - evaluation of breast mass (U/S, mammography as indicated) and reassurance
  - no strong evidence for avoidance of xanthine-containing products (coffee, tea, chocolate, cola)
  - analgesia (ibuprofen, ASA)
  - for severe symptoms: OCP, danazol, bromocriptine

Malignant
- Breast cancer (likely invasive, DCIS rarely forms a breast mass)
- Malignant phyllodes
- Angiosarcoma (rare)
### Proliferative Lesions – without Atypia

<table>
<thead>
<tr>
<th>Table 22. Proliferative Lesions - without Atypia</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clinical Features</td>
</tr>
<tr>
<td>-------------------</td>
</tr>
<tr>
<td><strong>Fibroadenoma</strong></td>
</tr>
<tr>
<td><strong>Intraductal Papilloma</strong></td>
</tr>
<tr>
<td><strong>Usual Ductal Hyperplasia</strong></td>
</tr>
<tr>
<td><strong>Sclerosing Adenosis</strong></td>
</tr>
</tbody>
</table>

### Atypical Hyperplasia
- can involve ducts (ductal hyperplasia with atypia) or lobules (lobular hyperplasia with atypia)
- cells lose apical-basal orientation
- increased risk of breast cancer
- diagnosis: core or excisional biopsy
- treatment: complete resection, risk modification (avoid exogenous hormones), close follow-up

### Other Lesions

#### Fat Necrosis
- uncommon, result of trauma (may be minor, positive history in only 50%), after breast surgery (i.e. reduction)
- firm, ill-defined mass with skin or nipple retraction, ± tenderness
- regress spontaneously, but complete imaging ± biopsy to rule out carcinoma

#### Mammary Duct Ectasia
- obstruction of a subareolar duct leading to duct dilation, inflammation, and fibrosis
- may present with nipple discharge, bluish mass under nipple, local pain
- risk of secondary infection (abscess, mastitis)
- resolves spontaneously

#### Montgomery Tubercle
- Montgomery tubercles (or Morgagni tubercles) are papular projections at the edge of the areola
- obstruction of these glands can lead to inflammation or cystic collections (cyst of Montgomery i.e. retroareolar cyst)
- if signs of secondary infection, start treatment for mastitis
- resolves spontaneously in weeks to years

#### Abscess
- lactational (see Obstetrics, OB48) vs. periductal/subareolar
- unilateral localized pain, tenderness, erythema, subareolar mass, nipple discharge, nipple inversion
- rule out inflammatory carcinoma, as indicated
- treatment: initially broad-spectrum antibiotics and I&D, if persistent total duct excision (definitive)
- if mass does not resolve: U/S to assess for presence of abscess, core biopsy to exclude cancer, consider MRI
Breast Cancer

Epidemiology
- leading cancer diagnosis in women in NA, 2nd leading cause of cancer mortality in women
- 1/8 (12.8% lifetime risk) women in Canada will be diagnosed with breast cancer in their lifetime
- 1/30 women in Canada will die from breast cancer

Risk Factors
- gender (99% female)
- age (80% >40 yr old)
- personal history of breast cancer and/or prior breast biopsy (regardless of pathology)
- family history of breast cancer (greater risk if relative was first degree and premenopausal)
- high breast density, nulliparity, first pregnancy >30 yr, menarche <12 yr, menopause >55 yr
- decreased risk with lactation, early menopause, early childbirth
- radiation exposure (e.g. mantle radiation for Hodgkin's disease)
- >5 yr HRT use, >10 yr OCP use
- BRCA1 and BRCA2 gene mutations
- alcohol use, obesity, sedentary lifestyle

Male breast cancer (<1%)
- most commonly invasive ductal carcinoma
- often diagnosed at later stages
- stage-for-stage similar prognosis to breast cancer in females
- consider genetic testing: most often hormone receptor positive

Investigations
- mammography
  - indications
  - findings indicative of higher risk of malignancy
  - mass that is poorly defined, spiculated border
  - microcalcifications
  - architectural distortion
  - interval mammographic changes
  - normal mammogram does not rule out suspicion of cancer based on clinical findings
- other radiographic studies
  - U/S: differentiate between cystic and solid
  - MRI: high sensitivity, low specificity
  - galactogram/ductogram (for nipple discharge): identifies lesions in ducts
  - metastatic workup indicated in Stage II-IV disease: bone scan, abdominal U/S, CXR (or CT chest/abdomen/pelvis), CT head (if specific neurological symptoms)

Diagnostic Procedures
- needle aspiration: for palpable cystic lesions; send fluid for cytology if blood or cyst does not completely resolve
- U/S or mammography guided core needle biopsy (most common)
- fine needle aspiration (FNA): for palpable solid masses; need experienced practitioner for adequate sampling
- excisional biopsy: only performed as second choice to core needle biopsy; should not be done for diagnosis if possible

Genetic Screening
- consider testing for BRCA1/2 if
  - patient diagnosed with breast AND ovarian cancer
  - strong family history of breast/ovarian cancer
  - family history of male breast cancer
  - young patient (<35 yr)
  - bilateral breast cancer in patients <50 yr

Staging
- patients are assigned a clinical stage pre-operatively (cTNM); following surgery the pathologic stage is determined (pTNM)
- clinical
  - tumour size by palpation, mammogram, U/S and/or MRI
  - nodal involvement by palpation, imaging
  - metastasis by physical exam, CXR, and abdominal U/S (or CT chest/abdomen/pelvis), bone scan (usually done post-operative if node-positive disease)
- pathological
  - tumour size and type (see Pathology below)
  - grade: modified Bloom and Richardson score (I to III) – histologic, nuclear, and mitotic grade
- number of axillary nodes positive for malignancy out of total nodes resected, extranodal extension, sentinel lymph node biopsy (SLNB) positive/negative
- tumour biology: estrogen receptor (ER), progesterone receptor (PR) and HER2/neu oncogene status
- margins: for invasive breast cancer negative margin is sufficient, for DCIS prefer 2mm margin
- lymphovascular invasion (LVI)
- extensive in situ component (EIC): DCIS in surrounding tissue
- involvement of dermal lymphatics (inflammatory) – automatically Stage IIIb

### Pathology

#### NON-INVASIVE

**Ductal Carcinoma in situ (DCIS)**
- proliferation of malignant ductal epithelial cells completely contained within breast ducts, often multifocal
- 80% non-palpable, detected by screening mammogram
- risk of invasive ductal carcinoma in same breast up to 35% in 10 yr
- treatment
  - lumpectomy with wide excision margins + radiation (5-10% risk invasive cancer)
  - mastectomy if large area of disease, high grade, or multifocal (risk of invasive cancer reduced to 1%)
  - possibly tamoxifen as an adjuvant treatment
  - 99% 5 yr survival

**Lobular Carcinoma in situ (LCIS)**
- neoplastic cells completely contained within breast lobule
- no palpable mass, no mammographic findings, usually incidental finding on breast biopsy for another indication
- LCIS is a risk factor for invasive carcinoma (approximately 1%/yr)
- treatment
  - if diagnosed on core biopsy, excisional biopsy necessary to rule out malignancy
  - if diagnosed on excisional biopsy, wide excision not needed since LCIS if often multicentric and not managed as precursor lesion
  - clinical follow-up and surveillance
  - consider chemoprevention (e.g. tamoxifen)

### INVASIVE

**Invasive Ductal Carcinoma (most common 80%)**
- originates from ductal epithelium and infiltrates supporting stroma
- characteristics: hard, scirrhous, infiltrating tentacles, gritty on cross-section

**Invasive Lobular Carcinoma (8-15%)**
- originates from lobular epithelium
- 20% bilateral (i.e. more often than infiltrating ductal carcinoma)
- does not form microcalcifications, harder to detect mammographically (may benefit from MRI)

**Paget’s Disease (1-3%)**
- ductal carcinoma that invades nipple with scaling, eczematoid lesion

**Favourable Features**
- <2 cm
- Grade I (low grade)
- Node negative
- ER positive
- Mucinous pattern
- Inflammatory cancer
- Her2Neu-positive
- Positive margins
- LVI
- ER
- HER2 status and proliferation assessment

**Unfavourable Features**
- >5 cm
- Grade II (high grade)
- Node positive
- ER negative
- Inflammatory cancer
- Her2Neu-positive
- Positive margins
- LVI
- ER
- HER2 status and proliferation assessment
- More painful procedure.

**FNAC**
- Variable sensitivity (35-95%) and specificity (48-100%).
- Quality correlates with skill of aspirator.
- Lower success rates for diagnosis of malignancy for palpable lesions (70%), non-palpable lesions (47%), and lesions <10 mm (60%).
- More accurate for histologic and immunohistochemistry examinations, and differentiation between in situ and invasive malignancies.
- Reliable for testing of ER, PR, and HER2 status and proliferation assessment.
- More painful procedure.

**CNB**
- High sensitivity (95-100%) and specificity (85-100%).
- High success rates for diagnosis of malignancy for palpable lesions (91%), non-palpable lesions (94%), and lesions <10 mm (90%).
- More accurate for histologic and immunohistochemistry examinations, and differentiation between in situ and invasive malignancies.
- Reliable for testing of ER, PR, and HER2 status and proliferation assessment.
- More painful procedure.

**Conclusions:** FNAC is preferable for palpable, low malignancy-risk lesions. However, for potential malignancies, CNB is advantageous with respect to prognosis and prediction and is likely cost-effective in the long-term.
Inflammatory Carcinoma (1-4%)
- ductal carcinoma that invades dermal lymphatics
- most aggressive form of breast cancer
- clinical features: erythema, skin edema, warm, swollen, and tender breast ± lump
- peau d'orange indicates advanced disease (IIIb-IV)

Sarcomas: rare
- most commonly Phyllodes tumour, a variant of fibroadenoma with potential for malignancy
- can also be angiosarcomas – after previous radiation

Lymphoma: rare

Other
- papillary, medullary, mucinous, tubular cancers
- generally better prognosis

Treatment

Table 24. Breast Cancer Treatment by Stage

<table>
<thead>
<tr>
<th>Stage</th>
<th>Primary Treatment Options</th>
<th>Adjuvant Systemic Therapy</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 (in situ)</td>
<td>BCS + radiotherapy if margins &gt;1 cm and low nuclear grade Mastectomy* ± SLNB</td>
<td>Consider post-operative tamoxifen for ER+, trastuzumab for HER2+</td>
</tr>
<tr>
<td>I</td>
<td>BCS + axillary node dissection + radiotherapy Mastectomy* + axillary node dissection/SNB</td>
<td>May not be needed; discuss risks/benefits of chemotherapy and tamoxifen</td>
</tr>
<tr>
<td>II</td>
<td>BCS + axillary node dissection + radiotherapy Mastectomy* + axillary node dissection/SNB</td>
<td>Chemotherapy for premenopausal women or postmenopausal and estrogen receptor (ER) negative, followed by tamoxifen if ER positive</td>
</tr>
<tr>
<td>III</td>
<td>Likely mastectomy + axillary node dissection + radiotherapy after chemotherapy (neoadjuvant)</td>
<td>Neoadjuvant therapy should be considered i.e. pre-operative especially if not resectable chemotherapy and/or hormone therapy. Adjuvant radiation and chemotherapy may also be appropriate (i.e. post-operative)</td>
</tr>
<tr>
<td>Inflammatory</td>
<td>Mastectomy + axillary node dissection + radiotherapy</td>
<td>Neoadjuvant therapy</td>
</tr>
<tr>
<td>IV</td>
<td>Surgery as appropriate for local control</td>
<td>Primary treatment is systemic therapy i.e. chemotherapy and/or hormone therapy</td>
</tr>
</tbody>
</table>

BCS = breast conserving surgery; SLNB = sentinel lymph node biopsy
*If no reason to select mastectomy, the choice between BCS + radiotherapy and mastectomy can be made according to patient’s preference since choice of local treatment does not significantly affect survival if local control is achieved

Analysis of Circulating Tumour DNA to Monitor Metastatic Breast Cancer
NEJM 2013;368:1199-1209

Study: The quantification of circulating tumour DNA, cancer antigen 15-3 (CA 15-3), and circulating tumour cells in 30 women with metastatic breast cancer receiving systemic therapy. The results were compared with radiographic imaging of tumours.

Results/Conclusions: Circulating tumour DNA was detected in 97% of women and showed greater correlation with changes in tumour burden than did CA 15-3 or circulating tumour cells, providing the earliest measure of treatment response in 53% of women. CA 15-3 and circulating tumour cells were detected in 76% and 87% of women, respectively. Circulating tumour DNA may therefore be an informative biomarker for metastatic breast cancer.

There is no survival benefit of mastectomy over lumpectomy plus radiation for stage I/II disease

Breast conserving surgery can be offered to most women with stage I/II disease

Primary Surgical Treatment

Breast Conservation Surgery (BCS)
- lumpectomy must be combined with radiation for survival equivalent to mastectomy
- contraindications include
  - high risk of local recurrence e.g. extensive malignant-type calcifications on mammogram, multifocal primary tumours
  - failure to obtain tumour-free margins after re-excision
  - not candidate for radiation therapy (pregnancy, previous radiation, collagen vascular disease)
  - large tumour size relative to breast

Mastectomy
- radical mastectomy (rarely): removes all breast tissue, skin, pectoralis muscle, axillary nodes
- modified radical mastectomy (MRM): removes all breast tissue, skin, and axillary nodes
- simple mastectomy: removes all breast tissue and skin
- see Plastic Surgery, PL33 for breast reconstruction

Sentinel Lymph Node Biopsy (SLNB)
- perform in women with clinically node-negative invasive breast cancer and those with extensive DCIS who are undergoing mastectomy
- patients with clinically suspicious nodes should U/S + FNA prior to decision to proceed with SLNB
- technetium-99 ± blue dye injected at tumour site prior to surgery to identify sentinel node(s)
- intra-operative frozen section evaluated can be considered
- proceed with ALND if >3 positive nodes, with 1-3 nodes whole breast radiation therapy may be alternative
- 5% false negative rate

Axillary Lymph Node Dissection (ALND)
- perform in all patients with pathologic confirmation of nodal involvement (including positive SLNB as above)
- risk of arm lymphedema (10-15%) especially if getting radiation therapy, decreased arm sensation, shoulder pain
ADJUVANT/NEOADJUVANT

Radiation
- indications
  - decrease risk of local recurrence; almost always used after BCS, sometimes after mastectomy
  - inoperable locally advanced cancer
  - axillary nodal radiation may be added if nodal involvement

Hormonal
- indications
  - ER positive plus node-positive or high-risk node-negative
  - SERM if premenopausal (e.g. tamoxifen) or aromatase inhibitors if postmenopausal (e.g. anastrozole); optimal duration 5-10 yr
  - ovarian ablation (e.g. goserelin/GnRH agonist, oophorectomy), progestins (e.g. megestrol acetate), androgens (e.g. fluoxymesterone) are other options
  - palliation for metastatic disease

Chemotherapy
- indications
  - ER negative plus node-positive or high-risk node-negative
  - ER positive and young age
  - stage I disease at high risk of recurrence (high grade, lymphovascular invasion)
  - palliation for metastatic disease
  - can consider oncoftype DX (21 gene analysis) to provide recurrence score (low, intermediate, high)

FOLLOW-UP

Post-Treatment Follow-Up
- assessment and physical exam q3-6mo x 3 yr, q6-12mo x 2yr, and annually thereafter
- following BCS mammography q6-12mo; can reduce to annual once stable, no other routine imaging unless clinically indicated
- women who receive tamoxifen should have regular gynecologic follow-up (increased risk of endometrial cancer)
- psychosocial support and counselling
- delayed breast reconstruction if underwent a mastectomy

Local/Regional Recurrence
- recurrence in treated breast or ipsilateral axilla
- 1% per yr up to maximum of 15% risk of developing contralateral malignancy
- 5x increased risk of developing metastases

Metastasis
- bone > lungs > pleura > liver > brain
- treatment is palliative: hormone therapy, chemotherapy, radiation
- overall survival of metastatic breast cancer is 36-60 mo

Surgical Endocrinology

Thyroid and Parathyroid
- see Endocrinology, E20 and Otolaryngology, OT35

Thyroidectomy
- indications: thyroid cancer, symptomatic thyroid mass or goitre, medically refractory Graves’ or hyperthyroidism
- contraindications: uncontrolled severe hyperthyroidism (i.e. Graves’) due to risk of intra-operative or post-operative thyroid storm
- pre-operative workup: thyroid U/S for thyroid nodules, FNA for large nodules, U/S of the neck for lesions suspicious for papillary or medullary thyroid cancer, CT neck useful to rule out extension, vocal cord function
- complications: hypocalcemia secondary to hypoparathyroidism, recurrent/superior laryngeal nerve injury, neck hematoma, infection, thyrotoxic storm

Parathyroidectomy
- indications: symptomatic primary hyperparathyroidism due to effects of PTH on bone or kidneys, asymptomatic primary hyperparathyroidism with specific laboratory criteria (elevated serum Ca, marked hypercalciuria, Cr clearance <30% normal, bone density reduction with T score <2.5, <50 yr)
- contraindications: familial hypocalciuric hypercalcemia
- pre-operative workup: 99mTc sestamibi scanning, ± SPECT or CT, U/S
- complications: recurrent/superior laryngeal nerve injury, post-operative hypocalcemia, infection, bleeding
Adrenal Gland

- see Endocrinology, E29
- functional anatomy
  - cortex: glomerulosa (mineralocorticoids), fasciculata (glucocorticoids), reticularis (sex steroids)
  - medulla: catecholamines (epinephrine, norepinephrine)
- types of adrenal tumours: functional (e.g. Cushing's syndrome, Conn's syndrome) or non-functional

INTEGRALOMA
- adrenal mass discovered by investigation of unrelated symptoms

Epidemiology
- benign adenoma (38%) > metastases to adrenal (22%) >> cyst, carcinoma, pheochromocytoma, neuroblastoma
- metastasis to adrenal gland from: lung > breast, colon, lymphoma, melanoma, kidney
- peak incidence of carcinoma: females age 50-60, risk decreases with increasing age and male gender

Investigations
- MRI, CT: size >6 cm is best predictor of primary adrenal carcinoma (92% are >6 cm)
- functional studies
  - pheochromocytoma: 24 h urine epinephrine, norepinephrine, metanephrine, normetanephrine, VMA (vanillylmandelic acid)
  - Cushing's: 24 h urine cortisol or 1 mg overnight dexamethasone suppression test
  - aldosteronoma: electrolytes, aldosterone:renin level, saline suppression test if appropriate
  - adrenal androgens: 17-ÖH progesterone, DHEAS
- FNA biopsy: if suspect metastasis to adrenal (must exclude pheochromocytoma first to prevent a hypertensive crisis)
  - indicated if history of cancer or patient is smoker
- iodocholesterol scintigraphy: may distinguish benign vs. malignant disease

Treatment
- functional tumour: resect
- non-functional tumour
  - >4 cm: resect
  - <4 cm: follow-up imaging in 6-12 mo, resect if >1 cm enlargement

Pancreas

INSULINOMA
- tumour that secretes insulin
- most common pancreatic endocrine neoplasm; 10% associated with MEN1 syndrome

Clinical Features
- Whipple's triad
- palpitations, trembling, diaphoresis, confusion, seizure, personality changes

Investigations
- blood work: decreased serum glucose and increased serum insulin and C-peptide
- U/S, CT: insulinomas evenly distributed throughout head, body, tail of pancreas

Treatment
- only 10% are malignant
- enucleation of solitary insulinomas may be done endoscopically
- tumours >2 cm located close to the pancreatic duct may require pancreatectomy or pancreaticoduodenectomy

GASTRINOMA
- tumour secreting gastrin; cause of Zollinger-Ellison syndrome

Clinical Features
- abdominal pain, PUD, severe esophagitis
- multiple ulcers in atypical locations refractory of antacid therapy
Investigations
• blood work: serum gastrin levels (usually >1,000 pg/mL), secretin stimulation test
• U/S, CT: 70-90% found in Passaro’s triangle (head of pancreas medially, 2nd portion of duodenum inferiorly, and the confluence of the cystic and CBD superiorly)
• octreotide scintigraphy scan

Treatment
• 50% are malignant
• surgical resection of tumour dependent on location
• non-surgical treatment: chemotherapy, somatostatin analogues, interferon, chemoembolization
• if inoperable, vagotomy can be performed for symptomatic control

VASOACTIVE INTESTINAL PEPTIDE-SECRETING TUMOUR
• tumour secreting VIP; commonly located in the distal pancreas and most are malignant when diagnosed

Clinical Features
• severe watery diarrhea causing dehydration, weakness, electrolyte imbalance

Investigations
• blood work: serum VIP levels
• U/S, CT

Treatment
• somatostatin analogues
• surgical resection/palliative debulking

<th>Treatment</th>
<th>Prognosis</th>
</tr>
</thead>
</table>
| **Intussusception** | Most common cause of bowel obstruction between the ages of 6-36 mo  
26/100,000 newborns  
M:F = 3:2  
Pathologic lead points: enlarged Peyer’s patches due to viral infections of the GI tract, polyps, Meckel’s diverticulum  
CF, lymphoma, IBD may increase risk | Idiopathic is most common  
Usually starts at ileocecal junction  
Telescoping of bowel into itself causing an obstruction and vascular compromise | Acute onset of abdominal pain which is classic episodic “colicky” pain  
Vomiting ± bilious  
Abdominal mass  
Curtain-jevy stool suggests mucosal necrosis and sloughing | Abdominal exam  
Palpate for masses (especially sausage shaped upper abdominal mass) and tenderness  
Signs of bowel obstruction: distended abdomen  
Look for localized peritonitis which suggests transmural ischemia | AXR for signs of bowel obstruction or perforation  
US if suspect pathology | If peritonitis, then consider operative management  
Non-operative management involves reduction via air contrast enema  
Operative reduction can be done open or laparoscopically  
Resection of involved colon if failure to reduce or bowel appears compromised | 10% recurrence rate  
If recurrent = more likely non-idiopathic  
In successfully reduced by enema in older children allow 2 wk resolution of edema then perform SBFT to rule out pathologic lead points |
| **Tracheoesophageal Fistula (TEF)** | 1:3,000-1:4,500  
Associated anomalies in 50%: VACTERL association (see Pediatrics, P42) | Varies with type of fistula  
May have history of maternal polyhydramnios  
May present after several months (if no associated esophageal atresia) of non-bilious vomiting, coughing, cyanosis with feeds; respiratory distress, recurrent pneumonia, frothy bubbles of mucus in mouth and nose that return after suctioning | X-ray: anatomic abnormalities, NGT curled in pouch | Investigate for other congenital anomalies, early repair by surgical ligation to prevent lung damage and maintain nutrition and growth | Complications: pneumonia, sepsis, reactive airways disease  
Following repair: esophageal stenosis and strictures at repair site, GERD and poor swallowing (i.e. dysphagia, regurgitation) |
| **Inguinal Hernias** | 5% of all term newborns  
2x risk and more likely bilateral if pre-term  
M:F = 4:1  
Low birth weight increases risk  
1/5 inguinal hernias will become incarcerated if patient is <1 yr old  
Incarceration is more common in females  
Associated with other conditions: androgen insensitivity, connective tissue diseases | All infant hernias are indirect: descent of intra-abdominal contents through the internal inguinal ring through a patent tunica vaginalis  
Most common presentation: painless intermittent mass in groin, may also note extension into scrotum (scrotal mass in absence of inguinal mass is a hydrocele)  
If incarcerated: tender, vomiting, firm mass, erythema then cyanosis of mass may be noted | Palpate for “bag of worms” suggests possible testicular varicocele  
Biannual testicular exam + palpation along inguinal canal to evaluate for any masses  
“Silk sign” – palpable thickening of cord Mass palpated at external inguinal ring and reducible through inguinal canal into abdomen  
Must always try reduction to confirm that hernia is not incarcerated | Physical exam is gold standard  
U/S only if physical exam uncertain (e.g. in small infants where exam can be difficult)  
Manual reduction – to relieve acute symptoms  
Herniorrhaphy – definitive treatment by reduction of herniated contents and high ligation of sac for indirect hernias  
Laparoscopic or open techniques | Risk of recurrence after surgical reduction <3% but higher if repair done in premature infants or if hernia was incarcerated/strangulated at repair |

---

**Skin Lesions**

- see Dermatology, D35; Emergency Medicine, ER17; Plastic Surgery, PL5

All inguinal hernias of infancy and childhood require repair at the earliest convenience; emergent repair if incarcerated/strangulated at repair.
Common Medications

Antiemetics
- dimenhydrinate (Gravol®) 25-50 mg PO/IV/IM q4-6h pm
- prochlorperazine (Stemetil®) 5-10 mg PO/IV/IM bid-tid pm
- metoclopramide (Maxeran®) 10 mg IV/IM q2-3h pm, 10-15 mg PO qid (30 min before meals and qhs)
- ondansetron (Zofran®) 4-8 mg PO q8h pm
- granisetron (Kytril®) 1 mg PO bid (for nausea from chemotherapy/radiation)

Analgesics
- acetaminophen ± codeine (Tylenol®/3) #2 plain 1-2 tabs q4-6h PO/PR pm
- hydroxyzine i.v. i.m. tabs PO q4h pm, 0.5-2 mg IV q3-4h pm
- ibuprofen 200-400 mg PO q4-6h pm
- morphine 2.5-10 mg IM/SC q4-6h pm + 1-2 mg IV q1h pm for breakthrough
- ketorolac (Toradol®) 30-60 mg IM/IV q6h pm
- Percocet® (acetaminophen/oxycodone, 325/5 mg) 1-2 tabs PO q4-6h pm

DVT Prophylaxis
- heparin 5,000 units SC bid, if cancer patient then heparin 5,000 units SC tid
- dalteparin (Fragmin®) 4,000 units SC daily
- enoxaparin (Lovenox®) 40 mg SC daily

Antidiarrheals
- imodium (Imodium®) 4 mg PO initially, then 2 mg PO after each loose stool up to 16 mg/d
- diphenoxylate + atropine (Lomotil®) 2 tabs/10 mL PO qid

Laxatives
- sennosides (Senokot®) 1-2 tabs qhs
- docusate sodium (Colace®) 100 mg PO bid
- glycerine suppository 1 tab PR pm
- lactulose 15-30 mL PO qid pm
- milk of magnesia (MOM) 30-60 mL PO qid pm
- bisacodyl (Dulcolax®) 5 mg PO pm

Sedatives
- zopiclone (Imovane®) 5-7.5 mg PO qhs pm
- lorazepam (Ativan®) 0.5-2 mg PO/SL qhs pm

Antibiotics
- cefazolin (Ancef®) 1 mg IV/IM on call to OR or q8h – GP except Enterococcus, GN only E. coli, Klebsiella, and Proteus
- cefalexin (Keflex®) 250-500 mg PO qid – Listeria, GP except Enterococcus, GN only E. coli, Klebsiella, and Proteus
- ceftaxone (Zinacef®) 1-2 g IV/IM q2h – broad coverage including Pseudomonas
- ampicillin 1-2 g IV q6h – Listeria, GP (Enterococcus) except Streptococcus and E. coli, oral anaerobes except Bacteroides
- gentamicin 3-5 mg/kg/d IV/IM divided q8h; monitor creatinine, gentamicin levels – GN including Pseudomonas
- ciprofloxacin 400 mg IV q2h, 500 mg PO bid – GN including Pseudomonas
- metronidazole (Flagyl®) 500 mg PO/IV bid (500 mg PO tid for C. difficile) – anaerobes
- clindamycin 600-900 mg IV q8h, 150-400 mg PO qid – GP except Enterococcus, anaerobes
- pipercillin/tazobactam 4.5 mg IV q6h – GP, GN, and anaerobes
- vancomycin 1g IV q12h – GM and MRSAs
- sulfamethoxazole/trimethoprim DS (Septra®) PO bid – GM, GN including nocardiace

Over-the-Counter Medications
- Pepto-Bismol® (bismuth subsalicylate) 2 tabs or 30 mL PO q30min-1h up to 8 doses/d
- Rolaids® (calcium carbonate and magnesium hydroxide) 2-4 tabs PO q1h pm, max 12 tabs/d

Geriatric Giants

• Memory (cognitive function)
• Falls
• Incontinence
• Polypharmacy

5 Is of Geriatrics

Immobility
Intellect
Incontinence
Iatrogenesis
Impaired homeostasis

Most Common Acute Disorders in the Elderly

• Cardiovascular disease (CHF, CVA, MI)
• Fracture (hip, vertebral, wrist)
• Medication-related
• Pneumonia
• Sepsis

Most Common Chronic Disorders in the Elderly

• Arthritis
• Cataracts and other visual problems
• COPD
• Cardiovascular disease
• DM (Type 2)
• Hearing impairment
• Hypertension
• Mental disorders
• Orthopedic disorders
• Sinusitis
Differential Diagnoses of Common Presentations

Constipation

- see Gastroenterology, G24

**Definition**
- less than 3 bowel movements in one wk and/or hard stools, straining, sense of blockade, needing manual maneuvers or incomplete evacuation on more than 25% of occasions for at least 12 wk (does not need to be consecutive)

**Epidemiology**
- chronic constipation increases with age (up to 1/3 of patients >65 yr experience constipation and 1/2 of patients >80)

**Pathophysiology**
- impaired rectal sensation (increased rectal distention required to stimulate the urge to defecate)
- colorectal dysmotility

**Treatment**
- non-pharmacological
  - increase fibre intake
  - ensure adequate fluid intake
  - discourage chronic laxative use
  - engage in regular exercise
  - review medication regime, reduce dosages or substitute
- pharmacologic
  - see Common Medications, GM15

Risk Factors for Constipation in the Elderly Include:
- Immobility
- Diet: low fibre/calorie diet, dehydration
- Medications: polypharmacy
- Drugs: narcotics, calcium channel blockers, anticholinergics
- GI: obstructive lesions (bowel obstruction, cancer, diverticular disease, IBD, strictures, uterine prolapse), altered colonic motility (IBS, colonic inertia)
- Neurological: spinal cord injury, Parkinson’s disease, stroke, autonomic dysfunction
- Metabolic: diabetes, hypokalemia, hypercalcemia
- Psychiatric: depression, dementia

Delirium, Dementia, and Depression

- see Psychiatry, PS20, PS21, PS11 and Neurology, N21

**Definition**
- pathologic decrease in memory, language, or executive function

**Differential Diagnosis**
- delirium, dementia, or pseudodementia of depression
Table 3. Differentiating the Three Ds of Cognitive Impairment

</tbody>
</table>

Delirium Prevention in Elderly
- Ensure optimal vision and hearing to support orientation (e.g., appropriate eye wear and hearing aids)
- Provide adequate nutrition and hydration (up in chair to eat and drink whenever feasible)
- Encourage regular mobilization to build and maintain strength, balance, and endurance
- Avoid unnecessary medications and monitor for drug interactions
- Avoid bladder catheterization if possible
- Ensure adequate sleep

Elder Abuse

Definition
- Includes physical abuse, sexual abuse, emotional/psychological abuse, financial abuse, abandonment, and neglect
- Elder abuse is a criminal offence under the Criminal Code of Canada
- In the U.S., most states have criminal penalties for elder abuse

Epidemiology
- In Canada in 2004, 3,370 incidents of violence against individuals aged ≥65 were reported
  - 29% of these incidents were committed by a family member
- In Canada in 2004, there were 50 homicides committed against seniors
- In the U.S., estimates of the frequency of elder abuse range from 3-8%
- Physician reporting is mandatory only in Newfoundand, Nova Scotia, and Prince Edward Island; in Ontario, only abuse occurring in nursing homes is mandatory to report
- Insufficient evidence to exclude/screening in the Periodic Health Exam

Risk Factors

Caregiver Abuse Screen (CASE)

- **instructions**
  - to be answered by caregivers, if answer “yes” to a question, further explore issue
  - the more “yes” responses, the more likely the presence of abuse
  - screening tool
  - please answer the following questions as a helper/caregiver:
    1. Do you sometimes have trouble making _____ control his/her temper or aggression?
    2. Do you sometimes feel that you are forced to do things you feel badly about?
    3. Do you find it difficult to manage _____’s behavior?
    4. Do you sometimes feel that you are forced to be tough with _____?
    5. Do you sometimes feel that you can’t do what is really necessary or what should be done for _____?
    6. Do you often feel you have to reject/ignore _____?
    7. Do you often feel so tired and exhausted that you cannot meet _____’s needs?
    8. Do you often feel you have to yell at _____?

From: NICE. Caregiver Abuse Screen. 2010. Reproduced with permission from NICE.

Management

- assess safety and determine capacity to make decisions about living arrangements
- establish need for hospitalization or alternate accommodation (e.g. immediate risk of physical harm by self or caregiver)
- involve multidisciplinary team (e.g. nurse, social worker, family members, and physicians including geriatrician, psychiatrist or family physician)
- educate and assist caregiver, contact local resources (e.g. legal aid, crisis support, PSW, caregiver support groups)
- interpret critical and lab findings that are key in exclusion, differentiation and diagnosis

Falls

Definition

- an event which results in a person coming to rest inadvertently on the ground or floor or other lower level

Epidemiology

- 30-40% of people >65 yr old and ~50% of people >80 yr old fall each year
  - equally common between men and women, but more likely to result in injury in women and death in men
  - 5% of falls lead to hospitalization
  - falls are the leading cause of death from injury in persons older than 65 yr
  - 25% associated with serious injuries (e.g. hip fracture, head injury, bruises, laceration)
  - between 25-75% do not recover to previous level of ADL function
  - mortality increases with age (171/100,000 in men >85 yr old) and type of injury (25% with hip fracture die within 6 mo)

Etiology

- multifactorial
- extrinsic
  - environmental (e.g. home layout, lighting, stairs, overcrowding)
  - accidental, abuse
  - side effects of medications and substance abuse (e.g. alcohol)
  - acute illness, exacerbation of chronic illness
- intrinsic
  - orthostatic/syncopal
  - age-related changes and diseases associated with aging: musculoskeletal (arthritis, muscle weakness), sensory (visual, proprioceptive, vestibular), cognitive (depression, dementia, delirium, anxiety), cardiovascular (CAD, arrhythmia, MI, low BP), neurologic (stroke, decreased LOC, gait disturbances/ataxia), metabolic (glucose, electrolytes)

Investigations

- directed by history and physical
- comprehensive geriatric assessment to identify all potential causes
- CBC, electrolytes, BUN, creatinine, glucose, Ca²⁺, TSH, B₁₂, urinalysis, cardiac enzymes, ECG, CT head

Prevention

- multidisciplinary, multifactorial, health, and environmental risk factor screening and intervention programs in the community
- muscle strengthening, balance retraining, and group exercise programs (e.g. Tai Chi)
- home hazard assessment and modification (e.g. remove rugs, add shower bars, etc.)
- prescription of vitamin D 1000 IU daily
- tapering or gradually discontinuation of psychotropic medication
- postural hypotension, heart rate, and rhythm abnormalities management
- eyesight and footwear optimization

Adapted from: Am Fam Phys 2001;61:2159-2172

Did a fall occur in the past year?

Single fall

Administer standardized gait and balance test

Recurrent falls

Administer multifactorial falls assessment

**Step 1**
Take focused history screening for:
- History of falls
- Medication review
- History of relevant risk factors

**Step 2**
Conduct physical examination, focusing on:
- Gait balance, and mobility
- Neurological function
- Muscle strength of the lower extremities
- Cardiovascular status
- Visual acuity
- Feet and footwear

**Step 3**
Conduct environmental assessment, including home safety inspection

**Step 4**
Perform functional assessment including:
- Activities of daily living
- Use of adaptive equipment and mobility aids
- Perceived fear related to falling

**Step 5**
Perform interventions based on findings of Step 1-4 assessments (rated on a scale of A-D; A=strong support, D=weak support):
- Adapt or modify home environment (A)
- Exercise, particularly balance and strength training (C)
- Withdraw or minimize use of hypnotics and antipsychotics (B)
- Withdraw or minimize use of other contributory medications (C)
- Manage postural hypotension (C)
- Manage foot problems or footwear (C)

Figure 2. Approach to falls in the elderly
Adapted from: Davuluri S, Dharmarajan TS. Clinical Geriatrics 2013;21(10)

### Frailty (Progressive Functional Decline/Failure to Thrive)

**Definition**
- Declining independence and functional capacity with loss of energy, vigor, and/or weight in older adults
- Not an inevitable consequence of aging

**Etiology**
- Malnutrition, functional impairment, cognitive impairment, and depression

**Table 5. Common Medical Conditions Associated with Failure to Thrive**

Incontinence

Fecal Incontinence

Definition

- involuntary passage or the inability to control the discharge of fecal matter through the rectum
- severity can range from unintentional flatus to the complete evacuation of bowel contents
- there are three subtypes
  1. passive incontinence: involuntary discharge of stool or gas without awareness
  2. urge incontinence: discharge of fecal matter in spite of active attempts to retain bowel contents
  3. fecal seepage: leakage of stool following otherwise normal evacuation

Epidemiology

- second leading cause of nursing home placement
- US estimates show that 10-25% of hospitalized geriatric patients suffer from fecal incontinence

Etiology

- commonly multifactorial
  - structural abnormalities
  - trauma (e.g. prior vaginal delivery, surgery)
  - prolapse
  - tumour/trauma (e.g. brain, spinal cord, cauda equina)
  - overflow (e.g. encopresis, impaction)
  - functional abnormalities
  - neurologic conditions – neuropathy, multiple sclerosis, stroke, dementia
  - others
    - constipation with overflow may be a factor
    - psychosis (willful soiling)
    - age >80 yr: decreased external sphincter strength and weak anal squeeze, increased rectal compliance, decreased resting tone and internal sphincter, impaired anal sensation
    - medications (e.g. laxatives, anticholinergics, antidepressants, caffeine, muscle relaxants)

Factors in Prevention/Management

- Lifestyle changes
- Medications
- Physical therapy
- Education
- Support

Indicators

- Depression
- Malnutrition
- Cognitive impairment
- Functional impairment (decreased mobility)

Limited laboratory tests and radiologic survey

MMSE, ADL, and IADL scales

“Up and Go Test”

Geriatric Depression Scale

Nutritional assessment

Medication review

Chronic disease evaluation

Environmental assessment

If response is positive, continue to treat*

If no or minimal response, conduct conference with patient, patient’s family, and caregivers

Repeat evaluations, if appropriate

Consider discussion of end-of-life and hospice options

* A positive response is defined as achievement of set pretreatment goals, as determined by the patient, the patient’s family, and participating caregivers.

Figure 3. Failure to thrive in elderly patients
Adapted from: American Family Physician 2004;70: 343-350
**Investigations (if cause not apparent from history and physical)**
- differentiate true incontinence from frequency and urgency (i.e. IBS, IBD)
- stool studies
- endorectal ultrasound
- colonoscopy, sigmoidoscopy, anoscopy
- anorectal manometry/functional testing

**Management**
- diet/bulking agent if stool is liquid or loose
- disimpaction, prevent impaction
- anti-diarrheal agents (e.g. loperamide)
- regular defecation program in patients with dementia
- counsel about biofeedback therapy (retraining of pelvic floor muscles)

**URINARY INCONTINENCE**
- see Urology, U5

**Definition**
- complaint of any involuntary loss of urine
- can be further defined according to patients symptoms as urgency urinary incontinence, stress urinary continence, mixed urinary incontinence, nocturnal enuresis, post-micturition dribble, and continuous urinary leakage

**Epidemiology**
- 15-30% prevalence dwelling in community and at least 50% of institutionalized seniors
- morbidity: cellulitis, pressure ulcers, urinary tract infections, falls with fractures, sleep deprivation, social withdrawal, depression, sexual dysfunction
- not associated with increased mortality

**Pathophysiology**
- not a normal part of aging, urinary incontinence is a loss of control due to a combination of:
  - genitourinary pathology: increased post-void residual volume, increased involuntary bladder contractions (urge incontinence)
  - age-related changes: decreased bladder capacity
  - comorbid conditions and medications
  - functional impairment
- in elderly women: decline in bladder outlet and urethral resistance pressure promoting stress incontinence
- in elderly men: prostatic enlargement can cause overflow and urge incontinence

**Gait Disorders**
- see Neurology, N36

**Hazards of Hospitalization**

Hypertension

Definition
- see Family Medicine, FM35

Definition
- blood pressure at which an otherwise healthy person would have increased risk of cardiovascular disease
- definition of high blood pressure has changed over time and differs between guidelines proposed by expert bodies
- target: <140/90 mm Hg for adults younger than 60. <130/80 mm Hg for individuals with DM. <150/90 for adults aged 60 or older

Epidemiology
- 60-80% of elderly (>65 yr old) have hypertension
  - 60% of these have isolated systolic HTN
  - the benefit of treating hypertension in the elderly is 2-4 times greater than that achieved in the treatment of younger patients with primary hypertension
  - systolic and pulse pressure are major predictors of outcome in the elderly patient
  - in older adults, base treatment on sBP

Management
- non-pharmacologic treatments are first-line, then thiazide monotherapy is recommended
  - add ACEI/ARB if also atherosclerosis, DM, CHF or chronic kidney disease
  - add β-blockers if also angina or CHF

Complications
- cardiovascular: orthostatic hypotension, venous thrombosis, embolism
- respiratory: decreased ventilation, atelectasis, pneumonia
- gastrointestinal: anorexia, constipation, incontinence, dehydration, malnutrition
- genitourinary: infection, urinary retention, bladder calculi, incontinence
- musculoskeletal: atrophy, contractures, bone loss
- skin: pressure ulcers
- psychological: sensory deprivation, delirium, depression

Immunizations
- the following immunizations are recommended for people 65 yr of age and older
  - tetanus: every 10 yr
  - pneumococcus: every 5 yr
  - influenza: every autumn
  - herpes zoster: Zostavax®

Malnutrition

Definition
- involuntary weight loss of ≥5% baseline body weight or ≥5 kg
- hypoalbuminemia, hypcholesterolemia

Etiology
- nutritional
  - decreased assimilation: impaired transit, maldigestion, malabsorption
  - decreased intake: financial, psychiatric (depression), cognitive deficits, anorexia associated with chronic disease, functional deficits (e.g. difficulty shopping, preparing meals or feeding oneself due to functional impairment)
- stress: acute or chronic illness/infection, chronic inflammation, abdominal pain
- mechanical: dental problems, dysphagia
- age-related changes: appetite dysregulation, decreased thirst
- mixed: increased energy demands (e.g. hyperthyroidism), abnormal metabolism, protein-losing enteropathy

Etiology of Malnutrition in the Elderly
- MEALS ON WHEELS
- Medications
- Emotional problems
- Anorexia
- Late-life paranoia
- Swallowing disorders
- Oral problems
- Nosocomial infections
- Wandering/dementia related activity
- Hyperthyroid/Hypercalcemia/
- Hypoaldenism
- Enteric disease
- Eating problems
- Low-salt/Low-fat diet
- Stones
Clinical Features

- history
  - recent or chronic illness
  - depression, GI symptoms
  - functional disability: impaired ADLs and IADLs
  - social factors: economic barriers, dental problems and living situation (e.g. living alone)
  - constitutional symptoms (e.g. recent weight loss)
- physical exam
  - BMI <23.5 in males, <22 in females should raise concern
  - temporal wasting, muscle wasting, presence of triceps skin fold
  - assess cognition

Investigations

- CBC, electrolytes, Ca^{2+}, Mg^{2+}, PO_{4}^{3-}, creatinine, LFTs (albumin, INR, bilirubin), B_{12}, folate, TSH, transferrin, lipid profile, urinalysis, ESR, CXR

Osteoporosis

- see Endocrinology, E42

Presbycusis

- see Otolaryngology, OT20

Pressure Ulcers

- see Plastic Surgery, PL16

Risk Factors

- extrinsic factors: friction, pressure, shear force
- intrinsic factors: immobility, malnutrition, moisture, sensory loss

Table 7. Classification of Pressure Ulcers

<table>
<thead>
<tr>
<th>Stage</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stage I</td>
<td>Changes include skin temperature, tissue consistency or sensation</td>
</tr>
<tr>
<td></td>
<td>An area of persistent erythema in lightly pigmented, intact skin; in darker skin, it may appear red, blue or purple</td>
</tr>
<tr>
<td>Stage II</td>
<td>Partial thickness skin loss involving the epidermis, dermis or both</td>
</tr>
<tr>
<td></td>
<td>The ulcer is superficial and presents as an abrasion, blister or shallow crater</td>
</tr>
<tr>
<td>Stage III</td>
<td>Full thickness skin loss involving damage or necrosis of subcutaneous tissue which may extend down to, but not through, underlying fascia</td>
</tr>
<tr>
<td></td>
<td>Presents as a deep crater with or without undermining of adjacent tissue</td>
</tr>
<tr>
<td>Stage IV</td>
<td>Full thickness skin loss with extensive destruction, tissue necrosis or damage to muscle, bone or supporting structures</td>
</tr>
<tr>
<td></td>
<td>May have associated undermining and/or sinus tracts</td>
</tr>
</tbody>
</table>

Prevention

- pressure reduction
  - frequent repositioning
  - pressure-reducing devices (static, dynamic)
- maintaining nutrition, encouraging mobility and managing incontinence

Treatment

- optimize nutritional status
- minimize pressure on wound
- analgesia
- wound debridement (mechanical, enzymatic, autolytic) and dressing application
- maintain moist wound environment to enable re-epithelialization
- treatment of wound infections (topical gentamicin, silver sulfadiazine, mupirocin)
- swab wounds not demonstrating clinical improvement for C&S; biopsy chronic wounds to rule out malignancy
- stage IV ulcers typically warrant surgical debridement
- consider other treatment options
  - negative pressure wound therapy/vacuum-assisted closure (VAC)
  - biological agents: application of fibroblast growth factor, platelet-derived growth factor to wound
  - non-contact normothermic wound therapy
  - electrotherapy
Driving Competency

Reporting Requirements

- physician-reporting to the Ministry of Transportation is mandatory in all provinces and territories except in Quebec, Nova Scotia, and Alberta, where it is discretionary
- not an issue unique to geriatrics – any patient may suffer from a medical condition that impairs their ability to drive should be reported
- in the U.S., varies by state

Conditions that may Impair Driving

<table>
<thead>
<tr>
<th>Condition</th>
<th>Impairment/Recommendation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alcohol</td>
<td>Patients with history of impaired driving and those with high probability of future impaired driving should not drive until further assessed. Alcohol dependence or abuse: if suspected, should be advised not to drive. Alcohol withdrawal seizure: must complete a rehabilitation program and remain abstinent and seizure-free for 6 mo before driving.</td>
</tr>
<tr>
<td>Blood Pressure Abnormalities</td>
<td>Hypertension: sustained BP &gt;170/110 should be evaluated carefully. Hypotension: if syncopal, discontinue until attacks are treated and preventable.</td>
</tr>
<tr>
<td>Cardiovascular Disease</td>
<td>Suspected asymptomatic CAD or stable angina: no restrictions. STEMI, NSTEMI with significant LV damage, coronary artery bypass surgery: no driving for one mo following hospital discharge. NSTEMI with minor LV damage, unstable angina: no driving for 48 h if percutaneous coronary intervention (PCI) performed or 7 d if no PCI performed.</td>
</tr>
<tr>
<td>Cerebrovascular Conditions</td>
<td>TIA: should not be allowed to drive until a medical assessment is completed. Stroke: should not drive for at least one mo; may resume driving if functionally able; no clinically significant motor, cognitive, perceptual or vision deficits; no obvious risk of sudden recurrence; underlying cause appropriately treated; no post-stroke seizure.</td>
</tr>
<tr>
<td>COPD</td>
<td>Mild/moderate impairment: no restrictions. Moderate or severe impairment requiring supplemental oxygen: road test with supplemental oxygen.</td>
</tr>
<tr>
<td>Cognitive Impairment/Dementia</td>
<td>Moderate to severe dementia is a contraindication to driving; defined as the &quot;inability to independently perform 2 or more IADLs or any basic ADL.&quot; Patients with mild dementia should be assessed; if indicated, refer to specialized driving testing centre; if deemed fit to drive, re-evaluate patient every 6-12 mo. Poor performance on MMSE, clock drawing or Trails B suggests a need to investigate driving ability further. MMSE score alone (whether normal or low) is insufficient to determine fitness to drive.</td>
</tr>
<tr>
<td>Diabetes</td>
<td>Diet controlled or oral hypoglycemic agents: no restrictions in absence of diabetes complications that may impair ability to drive (e.g. retinopathy, nephropathy, neuropathy, cardiovascular or cerebrovascular disease). Insulin use: may drive if no complications (as above) and no severe hypoglycemic episode in the last 6 mo.</td>
</tr>
<tr>
<td>Drugs</td>
<td>Be aware of: analgesics, anticholinergics, anticonvulsants, antidepressants, antipsychotics, opiates, sedatives, stimulants. Degree of impairment varies: patients should be warned of the medication/withdrawal effect on driving.</td>
</tr>
<tr>
<td>Hearing Loss</td>
<td>Effect of impaired hearing on ability to drive safely is controversial. Acute labyrinthitis, positional vertigo with horizontal head movement, recurrent vertigo: advise not to drive until condition resolves.</td>
</tr>
<tr>
<td>Musculoskeletal Disorders</td>
<td>Physician’s role is to report etiology, prognosis and extent of disability (pain, range of motion, coordination, muscle strength).</td>
</tr>
<tr>
<td>Post-Operative</td>
<td>Outpatient, conscious sedation: no driving for 24 h. Outpatient, general anesthesia: no driving for &gt;24 h.</td>
</tr>
<tr>
<td>Seizures</td>
<td>First, single, unprovoked: no driving for 3 mo until complete neurologic assessment, EEG, CT head. Epilepsy: can drive if seizure-free on medication and physician has insight into patient compliance.</td>
</tr>
<tr>
<td>Sleep Disorders</td>
<td>If patient is believed to be at risk due to a symptomatic sleep disorder but refuses investigation with a sleep study or refuses appropriate treatment, the patient should not drive.</td>
</tr>
<tr>
<td>Visual Impairment</td>
<td>Visual acuity: contraindicated to drive if &lt;20/50 with both eyes examined simultaneously. Visual field: contraindicated to drive if &lt;120° along horizontal meridian and 15° continuous above and below fixation with both eyes examined simultaneously.</td>
</tr>
</tbody>
</table>

N.B. guidelines included refer specifically to private driving; please see CMA guidelines for commercial driving.

Key Factors to Consider in Older Drivers

- SAFEDRIVE
- Safety record
- Attention (e.g. concentration lapses, episodes of disorientation)
- Family observations
- Alcohol abuse
- Drugs
- Reaction time
- Intellectual impairment
- Vision/Visuospatial function
- Executive functions (e.g. planning, decision-making, self-monitoring behaviours)

Systematic Review of the Efficacy of Compensatory Strategies in Persons with Dementia

<table>
<thead>
<tr>
<th>Journal</th>
<th>Title</th>
</tr>
</thead>
</table>

[55:878-884]: Study Selection: Systematic review of the case-control studies of drivers with a diagnosis of dementia. Purpose: To determine whether persons with dementia are at greater driving risk and, if so, to estimate the magnitude of this risk and determine whether there are efficacious methods to compensate for or accommodate it. Study Selection: Systematic review of the case-control studies of drivers with a diagnosis of dementia. Results: Drivers with dementia universally exhibited poorer performance on road tests and simulator evaluations. The one study that used an objective measure of motor vehicle crashes found that the crash risk in persons with dementia was 2.5 times greater than matched controls. No studies were found that examined the efficacy of methods to compensate for or accommodate the decreased driving performance. Conclusions: Drivers with dementia are poorer drivers than cognitively normal drivers, but studies have not consistently demonstrated higher crash rates. Clinicians and policy makers must take these findings into account when addressing issues pertinent to drivers with a diagnosis of dementia. |
Health Care Institutions

Table 9. Classification of Health Care Services and Institutions

<table>
<thead>
<tr>
<th>Institution/Service</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Community Support Services</strong></td>
<td>Health care services offered at home for those who can live independently at home or under the care of family members including professional health care services, personal care and support (ADL assistance), homemaking (IADL assistance), community support services (e.g. transportation, meal delivery, day programs, caregiver relief, security checks, etc.)</td>
</tr>
<tr>
<td><strong>Residential</strong></td>
<td>Divided into short (&lt;60-90 d/yr) and long (indefinite) stay</td>
</tr>
<tr>
<td>a) Seniors Affordable Housing</td>
<td>Seniors who live independently and manage their own care but prefer to live near other seniors; usually has accessibility features and rent is adjusted based on income</td>
</tr>
<tr>
<td>b) Retirement/Nursing Home</td>
<td>Residents are fairly independent and require minimal support with ADLs and IADLs; often privately owned</td>
</tr>
<tr>
<td>c) Supportive Housing</td>
<td>Residents require minimal to moderate assistance with daily activities while living independently; often rental units in an apartment and may offer some physiotherapy and rehabilitation services</td>
</tr>
<tr>
<td>d) Long-term Care/Skilled Nursing Facility</td>
<td>Around the clock nursing care and on-call physician coverage; often offers occupational therapy, physiotherapy, respiratory therapy, and rehabilitation services; may be used short-term for caregiver respite or for supportive patient care to regain strength and confidence after leaving the hospital</td>
</tr>
<tr>
<td>e) Hospice</td>
<td>Free-standing facility or designated floor in a hospital or nursing home for care of terminally ill patients and their families; focus is on quality of life and often requires prognosis ≤3 mo</td>
</tr>
</tbody>
</table>

- names of community health care institutions, types of facilities, and services offered vary between geographical locations
- factors to consider when seeking services/institutions include level of care required, support networks, duration of stay, and cost

Palliative and End-of-Life Care

Principles and Quality of Life

- support, educate, and treat both patient and family
- address physical, psychological, social and spiritual needs
- focus on symptom management and comfort measures
- offer therapeutic environment and bereavement support
- ensure maintenance of human dignity

End-of-Life Care Discussions

When to Initiate End-of-Life Care Discussions

- recent hospitalization for serious illness
- severe progressive medical condition(s)
- death expected within 6-12 mo
- patient inquires about end-of-life care

Suggested Topics for Discussion

- goals of care (disease vs. symptom management)
- advance directives, power of attorney, public guardian and trustee
- treatment options and likelihood of success
- common medical interventions
  - mechanical ventilation
  - antibiotic therapy
  - feeding tubes
- resuscitation options and likelihood of success (Full Code vs. DNR status including preferences for CPR, intubation, ICU admission, artificial hydration)

Power of Attorney

- see Ethical, Legal, and Organizational Medicine, ELOAM10

Guidance on the Management of Pain in Older People

Age and Aging 2013; 42:1-57
The three most common sites of pain in older adults are the back, leg/knee and hip. Acetaminophen should be considered first-line treatment for the management of both acute and persistent pain, particularly that which is of musculoskeletal origin. NSAIDs should be prescribed with caution and co-prescribed with a PPI.
Instructional Advance Directives

- see Ethical, Legal, and Organizational Medicine, ELOAM10

Symptom Management

Assessment Tools

- Edmonton Symptom Assessment System (ESAS): a tool that asks patients to rate the intensity of symptoms from 0 to 10 and allows for tracking of the efficacy of interventions. Assesses: pain, tiredness, nausea, depression, anxiety, drowsiness, appetite, well-being, shortness of breath, and "other problem"

- Palliative Performance Scale (PPS): a tool that uses functional status to predict survival in terminally ill patients. Assesses 5 components: ambulation, activity and evidence of disease, self-care, intake and conscious level

Source: J Palliat Care 1991;7:6-9 and Victoria Hospice Society 2006;120-121

Table 10. Management of Common End-of-Life Symptoms

<table>

<tr>
<th>Symptom</th>
<th>Non-Pharmacologic Management</th>
<th>Pharmacologic Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>Constipation</td>
<td>Rule out obstruction, impaction, anorectal disease; hydration and high fibre intake; increase mobility</td>
<td>Stop unnecessary opioids and medications with anticholinergic side effects; provide stool softener (e.g. docusate sodium), increase peristalsis (e.g. senna), alter water and electrolyte secretion (e.g. magnesium hydroxide, lactulose, peg3350)</td>
</tr>
<tr>
<td>Death Rattle/Increased Pulmonary Secretions</td>
<td>Oral suctioning Discontinue unnecessary IV solutions</td>
<td>Scopolamine SC or transdermal</td>
</tr>
<tr>
<td>Dry mouth</td>
<td>Oral hygiene q2h, ice cubes, sugarless gum</td>
<td>Artificial saliva substitutes, bethanochol, pilocarpine 1% solution as mouth rinse</td>
</tr>
<tr>
<td>Dysphagia</td>
<td>Frequent small feeds, ideally seated, keep head of bed elevated for 30 min after eating, suction as necessary</td>
<td>Oxygen, bronchodilators, opioids (e.g. morphine, hydromorphone)</td>
</tr>
<tr>
<td>Dyspnea</td>
<td>Elevate head of bed, eliminate allergens, open window/use fan</td>
<td>Oxycodone, hydroxyzine, metoclopramide, baclofen, marijuana</td>
</tr>
<tr>
<td>Hiccups</td>
<td>Dry sugar, breathing in paper bag</td>
<td>Chlorpromazine, haloperidol, metoclopramide, backofer, marijuana</td>
</tr>
<tr>
<td>Nausea and Vomiting</td>
<td>Frequent and small meals, avoid offensive strong odours, treat constipation if present</td>
<td>Raised ICP: dexamethasone Anticipatory nausea, anxiety: loraepam</td>
</tr>
<tr>
<td>Pain</td>
<td>Hot and cold compresses, music therapy, relaxation techniques, individualized program of physical activity designed to improve flexibility, strength and endurance, and cognitive behavioural therapy (CBT)</td>
<td>Noninvasive pain: non-opioids (NSAIDs, acetaminophen), weak opioids (codeine, hydrocodone, oxycodone), strong opioids (morphine, hydromorphone, oxycodone, fentanyl)</td>
</tr>
<tr>
<td>Pruritus</td>
<td>Bathing with tepid water, avoid soap, bath oils; sodium bicarbonate for jaundice</td>
<td>Neoplastic pain: anticonvulsants (gabapentin, pregabalin), antidepressants (TCAs, SSRIs), steroids (dexamethasone)</td>
</tr>
<tr>
<td>Weakness</td>
<td>Modify environment and activities to decrease energy expenditure</td>
<td>Bone pain: non-opioids, weak opioids, bisphosphonates, radiation therapy</td>
</tr>
</tbody>
</table>

WHO’s Pain Relief Ladder

Freedom from Cancer Pain
- Opioid for moderate to severe pain ± Non-opioid ± Adjunct
- Pain persisting or increasing ± Adjunct
- Opioid for mild to moderate pain ± Non-opioid ± Adjunct
- Pain persisting or increasing ± Adjunct

Death Rattle
Noise caused by the oscillatory movement of mucous secretions in the upper airway with inspiration and expiration

Nociceptive Pain
Somatic: localized to bone/skin/joint/muscle; gnawing, dull pain
Visceral: not well localized; crampy pain, pressure
Neuropathic Pain
 Burning, shooting, radiating pain; localized to dermatomal regions

Opioid Equivalent Doses (to 10 mg of IV morphine)

Serum creatinine does not reflect creatine clearance in the elderly

Instead, use: 
CrCI = (weight in kg) (140 – age)/(1.23) (mL/min) (serum creatinine in µmol/L)  
Multiply by 0.85 for females
**Pharmacokinetics**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Age Effect</th>
<th>Implications</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Absorption</strong> (less significant)</td>
<td>Increased gastric pH</td>
<td>Drug-drug and drug-food interactions are more likely to affect absorption</td>
</tr>
<tr>
<td>Decreased splanchnic blood flow, GI absorptive surface and dermal vascularity; delayed gastric emptying</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Distribution</strong></td>
<td>Increased total body fat and α1-glycoprotein</td>
<td>Lipophilic drugs have a larger volume of distribution</td>
</tr>
<tr>
<td>Decreased lean body mass, total body water and albumin</td>
<td>Decreased binding of acidic drugs, increased binding of basic drugs</td>
<td></td>
</tr>
<tr>
<td><strong>Metabolism</strong> (less significant)</td>
<td>Decreased hepatic mass and hepatic blood flow; impaired phase I reactions (oxidative system)</td>
<td>Lower doses may be therapeutic</td>
</tr>
<tr>
<td><strong>Elimination</strong></td>
<td>Decreased renal blood flow, GFR, tubular secretion and renal mass</td>
<td>For every x% reduction in clearance, decrease the dose by x% and increase the interval by x%</td>
</tr>
</tbody>
</table>

**Pharmacodynamics**

**Drug Sensitivity**
- changes in pharmacokinetics as well as intrinsic sensitivity lead to altered drug responses
- increased sensitivity to warfarin, sedatives, antipsychotics, digoxin and narcotics
- decreased sensitivity to β-blockers in majority of elderly patients, though some may have increased sensitivity

**Decreased Homeostasis**
- poorer compensatory mechanisms leading to more adverse reactions (e.g. bleeding with NSAIDs/anticoagulants, altered mental status with anticholinergic/sympathomimetic/anti-Parkinsonian drugs)

**Polypharmacy**

**Definition**
- prescription, administration or use of five or more medications at the same time

**Epidemiology**
- in Canada, > 60% of elderly individuals reported using ≥5 medications
- hospitalized elderly are given an average of 10 medications during admission

**Risk Factors for Non-Compliance**
- risk of non-compliance correlates with medication factors, not age
  - number of medications – compliance with 1 medication is 80%, but drops to 25% with ≥6 medications
  - increased dosing frequency, complicated container design, financial constraints, and cognitive impairment

**Adverse Drug Reactions (ADRs)**
- any noxious or unintended response to a drug that occurs at doses used for prophylaxis or therapy
- risk factors in the elderly
  - intrinsic: comorbidities, age-related changes in pharmacokinetics and pharmacodynamics
  - extrinsic: number of medications, multiple prescribers, unreliable drug history
  - 90% of ADRs are from: ASA, analgesics, anticoagulants, antimicrobials, antineoplastics, digoxin, diuretics, hypoglycemics, steroids

**Preventing Polypharmacy**
- consider drug: safer side effect profiles, convenient dosing schedules, convenient route, efficacy
- consider patient: other medications, clinical indications, medical comorbidities
- consider patient-drug interaction risk factors for ADRs
- review drug list regularly to eliminate medications with no clinical indication or with evidence of toxicity
- avoid treating an ADR with another medication

**Approach to Medication Review in the Elderly**
- NO TEARS
  - Need and indication
  - Open-ended questions (to get patient’s perspective on medications)
  - Tests and monitoring (to assess disease control)
  - Evidence and guidelines
  - Adverse events
  - Risk reduction (of adverse events such as falls)
  - Simplification/switches

**Benzodiazepines of Choice in the Elderly**
- LOT (Lorazepam)
- Oxazepam
- Temazepam

**Principles for Prescribing in the Elderly**
- CARED
  - Caution/Compliance
  - Age (adjust dosage for age)
  - Review regimen regularly
  - Educate
  - Discontinue unnecessary medications

**Geriatric Pearls.** Philadelphia: FA Davis Company, 1999

**Adverse drug reactions in the elderly may present as delirium, falls, fractures, urinary incontinence/retention or fecal incontinence/impaction**
Inappropriate Prescribing in the Elderly

Epidemiology
- The estimated prevalence of potentially inappropriate prescribing ranges from 12–40%.

Beers Criteria
- A list of medications to avoid in adults 65 yr and older due to safety concerns,
- Examples include long-acting benzodiazepines, strong anticholinergics, high-dose sedatives
- The elderly are also often under-treated (ACEI, ASA, β-blockers, thrombolytics, warfarin).

Toronto Notes 2016
Basic Anatomy Review

A. EXTERNAL GENITALIA
• referred to collectively as the vulva
• blood supply: internal pudendal artery
• sensory innervation: pudendal nerve
• lymphatic drainage: inguinal nodes

B. VAGINA
• muscular canal extending from cervix to vulva, anterior to rectum and posterior to bladder
• lined by rugated, stratified-squamous epithelium
• upper vagina separated by cervix into anterior, posterior, and lateral fornices
• blood supply: vaginal branch of internal pudendal artery with anastamoses from uterine, inferior vesical, and middle rectal arteries

C. UTERUS
• thick walled, muscular organ between bladder and rectum, consisting of two major parts:
  • uterine corpus
  • cervix
• blood supply: uterine artery (branch of the internal iliac artery)
• supported by the pelvic diaphragm, the pelvic organs, and 4 paired sets of ligaments
• round ligaments: travel from anterior surface of uterus, through broad ligaments, and inguinal canals then terminate in the labia majora
• function: anteversion
• blood supply: Sampson’s artery (branch of uterine artery running through round ligament)
• uterosacral ligaments: arise from sacral fascia and insert into posterior inferior uterus
• function: mechanical support for uterus and contain autonomic nerve fibres
• cardinal ligaments: extend from lateral pelvic walls and insert into lateral cervix and vagina
• function: mechanical support, prevent prolapse
• broad ligaments: pass from lateral pelvic wall to sides of uterus; contain fallopian tube, round ligament, ovarian ligament, nerves, vessels, and lymphatics
• infundibulopelvic ligament: continuous tissue that connects ovary to pelvic wall
• contains the ovarian artery, ovarian vein, ovarian plexus, and lymphatic vessels
• position of the uterus
  • antverted (majority)
  • retroverted

D. FALLOPIAN TUBES
- 8-14 cm muscular tubes extending laterally from the uterus to ovary
- interstitial, isthmic, ampullary, and infundibular segments; terminates at fimbriae
- mesosalpinx: peritoneal fold that attaches fallopian tube to broad ligament
- blood supply: uterine and ovarian arteries

E. OVARIES
- consist of cortex with ova and medulla with blood supply
- supported by infundibulopelvic ligament (suspensory ligament of ovary)
- mesovarium: peritoneal fold that attaches ovary to broad ligament
- blood supply: ovarian arteries (branches off aorta), left ovarian vein (drains into left renal vein), right ovarian vein (drains into inferior vena cava)

Figure 4. Vascular supply

**Menstruation**

**Stages of Puberty**
- see Pediatrics, P31
- adrenarche: increase in secretion of adrenal androgens; usually precedes gonadarche by 2 yr
- gonadarche: increased secretion of gonadal sex steroids; ~age 8 yr
- thelarche: breast development
- pubarche: pubic and axillary hair development
- menarche: onset of menses, usually following peak height velocity and/or 2 yr following breast budding
**Menstrual Cycle**

### Characteristics
- Menarche: 10-15 yr
- Average: 12.2 yr
- Entire cycle: 28 ± 7 d with bleeding for 1-6 d
- 25-80 mL blood loss per cycle

### Estrogen
- **ESTROGEN** is the main hormone in the follicular/proliferative phase and is stimulated by FSH. As the level increases it acts negatively on FSH. The majority of estrogen is secreted by the dominant follicle.

#### Estrogen effects
- On the follicles in the ovaries
  - Reduces atresia
- On the endometrium
  - Proliferation of glandular and stromal tissue
- On all target tissues
  - Decreases E receptors

### Progesterone
- **PROGESTERONE** is the main hormone in the luteal/secretory phase and is stimulated by LH. Increased progesterone acts negatively on LH and is secreted by the corpus luteum (remnant of dominant follicle).

#### Progesterone effects
- On the endometrium
  - Cessation of mitoses (stops building endometrium up)
  - “Organization” of glands (initiates secretions from glands)
  - Inhibits macrophages, interleukin-8, and enzymes from degrading endometrium
- On all target tissues
  - Decrease E receptors (the “anti-estrogen” effect)
  - Decrease P receptors

---

**Figure 5. Events of the normal menstrual cycle**

- **FOLLICULAR/PROLIFERATIVE PHASE (Variable Duration)**
  - Early: ↓ E and ↓ P (from end of previous cycle)
  - Mid: ↑ FSH acts on ovarian granulosa cells
  - Late: Growing follicles continue to secrete E

- **LUTEAL/SECRETORY PHASE (Fixed Duration - 14 days)**
  - Early-Mid: Sudden switch from negative to positive feedback (E and P now ↑ FSH & LH)
  - Late: Switch back to negative feedback

- **Ovulation**
  - Early-Mid: ↑ LH pulse amplitude (LH surge)
  - Late: ↓ LH

- **HPO Axis**
  - Early: ↓ E and ↓ P (from end of previous cycle)
  - Mid: ↑ FSH pulse frequency
  - Late: ↓ LH pulse frequency

- **Hormones**
  - Early: ↓ E from follicles (ovary)
  - Mid: ↑ LH from follicles (ovary)
  - Late: ↓ LH from corpus luteum

- **Feedback on HPO Axis**
  - Early: Negative feedback E → ↓ FSH, ↓ LH
  - Mid: ↓ LH pulse frequency
  - Late: ↓ LH pulse frequency

- **Ovaries**
  - Early: ↑ follicular growth in 3-30 follicles
  - Mid: ↓ LH from corpus luteum
  - Late: ↓ LH from corpus luteum

- **Endometrium**
  - Early: Menses from P withdrawal
  - Mid: E builds up endometrium
  - Late: P stabilizes endometrium

- **Cervical Mucus**
  - Early: Cervical mucus: Clear, ↑ amount, Spinnbarkeit 8-10 cm, more stringy
  - Mid: Opaque, scant amount, Spinnbarkeit 1-2 cm
**Premenstrual Syndrome**

- **synonyms:** “ovarian cycle syndrome,” “menstrual molimina” (moodiness)

**Etiology**
- multifactorial: not completely understood; genetics likely play a role
- CNS-mediated neurotransmitter interactions with sex steroids (progesterone, estrogen, and testosterone)
- serotonergic dysregulation – currently most plausible theory

**Diagnostic Criteria for Premenstrual Syndrome**
- at least one affective and one somatic symptom during the 5 d before menses in each of the three prior menstrual cycles
  - affective: depression, angry outbursts, irritability, anxiety, confusion, social withdrawal
  - somatic: breast tenderness, abdominal bloating, headache, swelling of extremities
- symptoms relieved within 4 d of onset of menses
- symptoms present in the absence of any pharmacologic therapy, drug or alcohol use
- symptoms occur reproducibly during 2 cycles of prospective recording
- patient suffers from identifiable dysfunction in social or economic performance

**Treatment**
- goal: symptom relief
- psychological support
- diet SUPPLEMENTS
  - avoid sodium, simple sugars, caffeine, and alcohol
  - calcium (1,200-1,600 mg/d), magnesium (400-800 mg/d), vitamin E (400 IU/d), vitamin B6
- medications
  - NSAIDs for discomfort and pain
  - spironolactone for fluid retention: used during luteal phase
  - SSRIs: used during luteal phase x 14 d or continuously
  - OCP: primarily beneficial for physical/somatic symptoms
  - danazol: an androgen that inhibits the pituitary-ovarian axis
  - GnRH agonists if PMS is severe and unresponsive to treatment (may use prior to considering definitive treatment with BSO)
- mind body approaches
  - regular aerobic exercise
  - cognitive behavioural therapy
  - relaxation, light therapy biofeedback, and guided imagery
- herbal remedies (variable evidence)
  - evening primrose oil, black cohosh, St. John’s wort, kava, ginkgo, agnus castus fruit extract
- BSO if symptoms severe

**Premenstrual Dysphoric Disorder**

**Definition**
- official diagnosis in the DSM-5
- described as a more severe form of PMS with specific diagnostic criteria
- treatment with SSRIs (first line), and Yaz OCP (highly effective)
Abnormal Uterine Bleeding

- see Disorders of Menstruation, GY10
- menstrual bleeding should be evaluated by ascertaining: frequency/regularity of menses, duration, volume of flow, affects on quality of life and timing (inter or premenstrual or breakthrough)
- classified as
  - regular: cycle to cycle variability of <20 d
  - irregular: cycle to cycle variability of ≥20 d
  - heavy menstrual bleeding: ≥80 cc of blood loss per cycle or ≥8 d of bleeding per cycle or bleeding that significantly affects quality of life
  - postmenopausal bleeding: any bleeding that presents >1 yr after menopause; must rule out endometrial cancer

Dysmenorrhea

- see Disorders of Menstruation, GY13
- primary/idiopathic
- secondary (acquired)
  - endometriosis
  - adenomyosis
  - uterine polyps
  - uterine anomalies (e.g. non-communicating uterine horn)
  - leiomyoma
  - intrauterine synechiae
  - ovarian cysts
  - cervical stenosis
  - imperforate hymen, transverse vaginal septum
  - pelvic inflammatory disease
  - IUD (copper)
  - foreign body

Vaginal Discharge/Pruritus

- see Gynecological Infections, GY25
- physiologic discharge and cervical mucus production
- non-physiologic
  - genital tract infection
  - vulvovaginitis: candidiasis, trichomoniasis, BV, polymicrobial superficial infection
  - chlamydia, gonorrhea
  - pyosalpinx, salpingitis
  - genital tract inflammation (non-infectious)
  - local: chemical irritants, douches, sprays, foreign body, trauma, atrophic vaginitis, desquamative inflammatory vaginitis, focal vulvitis
  - systemic: toxic shock syndrome, Crohn's disease, collagen disease, dermatologic (e.g. lichen sclerosis)
  - IUD, OCP (secondary to progesterone)
Pelvic Pain

- **Acute**
  - Gynecological
  - Non-gynecological
- **Chronic**
  - Gynecological
  - Chronic PID
  - Endometriosis
  - Adenomyosis
  - Adhesions
  - Dysmenorrhea
  - Pelvic congestion syndrome
  - Ovarian remnant syndrome
  - Fibroid (rare)
  - Uterine prolapse (rare)
- **Non-gynecological**
  - Referred pain
  - Urinary retention
  - Urethral syndrome
  - Interstitial cystitis
  - GI neoplasm
  - IBS
  - IBD
  - Constipation
  - Partial bowel obstruction
  - Diverticulitis
  - Hernia formation
  - Nerve entrapment
  - Sexual/physical/psychological abuse
  - Depression
  - Anxiety
  - Somatization

- **Adnexal**
  - Mittelschmerz
  - Ruptured ovarian cyst
  - Ruptured ectopic pregnancy
  - Hemorrhage into cyst/neoplasm
  - Ovarian/tubal torsion

- **Uterine**
  - Fibroid degeneration
  - Torsion of pedunculated fibroid
  - Pyometra/hematometra
  - Endometritis

- **Gastrointestinal**
  - Appendicitis
  - Mesenteric adenitis
  - Diverticulitis
  - IBD
  - Renal colic

**Note:** 20% of chronic pelvic pain patients have a history of previous sexual abuse/assault; remember to ask about it.

Figure 7. Approach to pelvic pain

Pelvic Mass

- **Ovarian**
  - Functional Cysts (always benign)
    - Corpus luteum cyst
    - Follicular cyst
    - Theca lutein cyst
    - Hemorrhagic cyst
  - Neoplasm
    - Benign (most common in >40 yr)
      - Dermoid cyst
    - Malignant (most common in <20 yr)
      - Epithelial cell
  - Other
    - PCOS
    - Endometrioma
    - Tube-ovarian abscess
    - Luteoma of pregnancy

- **Neoplasms**
  - Benign
    - Corpus luteum cyst
    - Follicular cyst
    - Theca lutein cyst
    - Hemorrhagic cyst
  - Malignant
    - Most common (mesonephric and paramesonephric cysts)
    - Inflammation, cysts (mesonephric, paramesonephric)
    - Malignancy
    - Tubo-ovarian abscess (PID)

- **Other**
  - Gynecological
    - Ectopic pregnancy
    - Pelvic adhesions (resulting in fluid entrapment)
    - Paratubal cysts
    - Pyosalpinx/Hydrosalpinx
    - Primary fallopian tube neoplasms
  - Gastrointestinal
    - Appendiceal abscess
    - Diverticular abscess
    - Diverticulosis, diverticulitis
    - Carcinoma of rectum/colon
  - Genitourinary
    - Distended bladder
    - Pelvic kidney
    - Carcinoma of bladder
  - Lymphoma

Figure 8. Differential diagnosis of pelvic mass
**Dyspareunia**

![Dyspareunia Diagram](image)

**First and Second Trimester Bleeding**

**Approach to the Patient with Bleeding in T1/T2**

**History**
- risk factors for ectopic pregnancy (see Ectopic Pregnancy, GY21)
- previous spontaneous abortion
- recent trauma
- characteristics of the bleeding (including any tissue passed)
- characteristics of the pain (cramping pain suggests spontaneous abortion)
- history of coagulopathy
- gynecological/obstetric history
- fatigue, dizziness, syncopal episodes due to hypovolemia, fever (may be associated with septic abortion)

**Physical**
- vitals (including orthostatic changes)
- abdomen (symphysis fundal height, tenderness, presence of contractions)
- perineum (signs of trauma, genital lesions)
- speculum exam (cervical os open or closed, presence of active bleeding/clots/tissue)
- pelvic exam (uterine size, adnexal mass, uterine/adnexal tenderness)

**Investigations**
- \(\beta\)-hCG (lower than expected for GA in spontaneous abortion, ectopic pregnancy)
- U/S (confirm intrauterine pregnancy and fetal viability)
- CBC
- group and screen

**Treatment**
- IV resuscitation for hemorrhagic shock
- treat the underlying cause

**Common Investigations and Procedures**

**Imaging**

**Ultrasound (U/S)**
- transabdominal or transvaginal U/S is the imaging modality of choice for pelvic structures
- transvaginal U/S provides better resolution of uterus and adnexal structures
  - detects early pregnancy if \(\beta\)-hCG \(\geq\) 1,500 (\(\beta\)-hCG must be \(\geq\) 6,500 for transabdominal U/S)
  - may be used to identify pelvic pathology
  - identify ectopic pregnancy, intrauterine pregnancy
  - assess uterine, adnexal, cul-de-sac, ovarian masses (e.g. solid or cystic)
  - determine endometrial thickness, locate/characterize fibroids
  - monitor follicles during assisted reproduction
  - assess endometrial lining in postmenopausal women

Every woman of childbearing age presenting to ER with abdominal or pelvic pain should have \(\beta\)-hCG measured
**Endometrial Biopsy**

- performed in the office using an endometrial suction curette (pipelle) guided through the cervix to aspirate fragments of endometrium
  - pre-treatment with misoprostol (Cyteoc®) if nulliparous or postmenopausal
- more invasive procedure (D&C) may be done in the office or operating room ± hysteroscopy
- indications
  - AUB/PMB
  - cancer screening (e.g. following specific cervical cytology results (i.e. AGUS) or in high-risk women)

**Hysterectomy**

Indications
- uterine fibroids
- endometriosis, adenomyosis
- uterine prolapse
- pelvic pain
- AUB
- cancer (endometrium, ovaries, fallopian tubes, cervix)

Complications
- general anesthetic
- bleeding
- infection
- injury to other organs (ureter, bladder, rectum)
- loss of ovarian function (if ovaries removed, iatrogenic menopause)

Approaches
1. vaginal vs. abdominal
   - indications for vaginal approach: mobile uterus, uterine size <12 wk
   - advantages of vaginal approach: less pain, faster recovery time, allows for simultaneous repair of rectocele/cystocele/enterocele, improved aesthetics
2. open vs. laparoscopic-assisted
   - advantages of laparoscopy: less pain, faster recovery, improved aesthetics, shorter hospital stay
   - unless contraindicated or unavailable laparoscopic hysterectomy is the standard of care
3. robotic
   - similar advantages to laparoscopy
   - more dexterous

</tr>
</tbody>
</table>

Investigations

Figure 10. Diagnostic approach to amenorrhea
• β-hCG, hormonal workup (TSH, prolactin, FSH, LH, androgens, estradiol)
• progesterone challenge to assess estrogen status
  ▪ medroxyprogesterone acetate (Provera) 10 mg PO OD for 10-14 d
  ▪ any uterine bleed within 2-7 d after completion of Provera is considered to be a positive test/withdrawal bleed
  ▪ withdrawal bleed suggests presence of adequate estrogen to thicken the endometrium; thus withdrawal of progesterone results in bleeding
  ▪ if no bleeding occurs, there may be inadequate estrogen (hypoestrogenism), excessive androgens, or progesterones (decidualization)
• karyotype: indicated if premature ovarian failure or absent puberty
• U/S to confirm normal anatomy, identify PCOS

*Ferrous gluconate 300 mg PO TID will raise Hb 10 points per wk*

### Treatment
- resuscitate patient if hemodynamically unstable
- treat underlying disorders
  - if anatomic lesions and systemic disease have been ruled out, consider DUB
- medical
  - mild DUB
  - NSAIDs
  - anti-fibrinolytic (e.g. Cyklokapron*) at time of menses
  - combined OCP
  - progestins (Provera*) on first 10-14 d of each month or every 3 mo if oligomenorrheic
  - Mirena* IUD
  - danazol
  - acute, severe DUB
    - replace fluid losses, consider admission
    - a) estrogen (Premarin*) 25 mg IV q4h x 24 h with Gravol* 50 mg IV/PO q4h or anti-fibrinolytic (e.g. Cyklokapron*) 10 mg/kg IV q8h
    - b) any OCP with minimum 50 µg estradiol 1 tab PO q4h x 24 h with Gravol* 50 mg IV/PO q4h
      - taper to 1 tab tid x 2 d → bid x 2 d → OD
    - after (a) or (b), maintain patient on monophasic OCP for next several months or consider alternative medical treatment
  - clomiphene citrate
    - consider in patients who are anovulatory and who wish to get pregnant
- surgical
  - endometrial ablation; consider pretreatment with danazol or GnRH agonists
  - if finished childbearing
  - repeat procedure may be required if symptom reoccur especially if <40 yr
  - hysterectomy: definitive treatment

---

**Dysfunctional Uterine Bleeding**
Abnormal bleeding not attributable to organic (anatomic/systemic) disease
DUB is a diagnosis of exclusion
Anovulatory AUB often used synonymously with DUB

AUB in women >40 yr requires an endometrial biopsy to rule out cancer even if known to have fibroids

Determine if patient is hemodynamically stable prior to any other task
### Dysmenorrhea

**Etiology**
- see Differential Diagnoses of Common Presentations, GY6

**Table 6. Comparison of Primary and Secondary Dysmenorrhea**

<table>
<thead>
<tr>
<th></th>
<th>Primary Dysmenorrhea</th>
<th>Secondary Dysmenorrhea</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Features</strong></td>
<td>Menstrual pain in absence of organic disease</td>
<td>Menstrual pain due to organic disease</td>
</tr>
<tr>
<td></td>
<td>Begins 6 mo-2 yr after menarche (once ovulatory cycles established)</td>
<td>Usually begins in women who are in their 20s, worsens with age May improve temporarily after childbirth</td>
</tr>
<tr>
<td><strong>Signs and Symptoms</strong></td>
<td>Colicky pain in abdomen, radiating to the lower back, labia, and inner thighs beginning hours before onset of bleeding and persisting for hours or days (48-72 h) Associated symptoms: N/V, altered bowel habits, headaches, fatigue (prostaglandin-associated)</td>
<td>Associated dyspareunia, abnormal bleeding, infertility</td>
</tr>
<tr>
<td><strong>Diagnosis</strong></td>
<td>Associated dyspareunia, abnormal bleeding, infertility Rule out underlying pelvic pathology and confirm cyclic nature of pain</td>
<td>Bimanual exam: uterine or adnexal tenderness, fixed uterine retroflexion, uterosacral nodularity, pelvic mass, or enlarged irregular uterus (findings are rare in women &lt;20 yr) U/S, laparoscopy and hysteroscopy may be necessary to establish the diagnosis Screening for infections (vaginal and cervical cultures) and Papanicolaou smear may be required</td>
</tr>
<tr>
<td><strong>Treatment</strong></td>
<td>PG synthetase inhibitors (e.g. Anaprox®): should be started before onset of pain OCP: suppress ovulation/reduce menstrual flow</td>
<td>Treat underlying cause</td>
</tr>
</tbody>
</table>

### Endometriosis

**Etiology**
- not fully understood
- proposed mechanisms (combination likely involved)
  - retrograde menstruation (Sampson’s theory)
    - seeding of endometrial cells by trans tubal regurgitation during menstruation
    - endometrial cells most often found in dependent sites of the pelvis
  - immunologic theory: altered immunity may limit clearance of transplanted endometrial cells from pelvic cavity (may be due to decreased NK cell activity)
  - metaplasia of coelomic epithelium
    - undefined endogenous biochemical factor may induce undifferentiated peritoneal cells to develop into endometrial tissue
  - extrapelvic disease may be due to aberrant vascular or lymphatic dissemination of cells
    - e.g. ovarian endometriosis may be due to direct lymphatic flow from uterus to ovaries

**Epidemiology**
- incidence: 15-30% of pre-menopausal women
- mean age at presentation: 25-30 yr
- regresses after menopause

**Risk Factors**
- family history (7-10x increased risk if affected 1st degree relative)
- obstructive anomalies of the genital tract (earlier onset) – resolve with treatment of anomaly
- nulliparity
- age >25 yr

**Sites of Occurrence**
- ovaries: 60% patients have ovarian involvement
- broad ligament, vesicoperitoneal fold
- peritoneal surface of the cul-de-sac, uterosacral ligaments
- rectosigmoid colon, appendix
- rarely may occur in sites outside abdomen/pelvis, including lungs

**Endometriosis is classified according to a scoring system standardized by the American Society for Reproductive Medicine; score is based on location and extent of disease**

**Endometriosis**
- The presence of endometrial tissue (glands and stroma) outside of the uterine cavity

**Endometrioma**
- Endometriotic cyst on surface of ovary

**Differential Diagnoses**
- Chronic PID, recurrent acute salpingitis
- Hemorrhagic corpus luteum
- Benign/malignant ovarian neoplasm
- Ectopic pregnancy

**Recurrence Rates**
- Medical therapy: 30-50%
- Conservative surgery: 14-40%
Clinical Features

- may be asymptomatic and can occur with one of 3 presentations

1. **pain**
   - menstrual symptoms
   - cyclic symptoms due to growth and bleeding of ectopic endometrium, usually precede menses (24-48 h) and continue throughout and after flow
   - secondary dysmenorrhea
   - sacral backache with menses
   - pain may eventually become chronic, worsening perimenstrually
   - deep dyspareunia
   - bowel and bladder symptoms
     - frequency, dysuria, hematuria
   - cyclic diarrhea/constipation, hematochezia, dyschezia (suggestive of deeply infiltrating disease)

2. **infertility**
   - 30-40% of patients with endometriosis will be infertile
   - 15-30% of those who are infertile will have endometriosis

3. **mass (endometrioma)**
   - ovarian mass can present with any of above symptoms or be asymptomatic
   - physical
     - tender nodularity of uterine ligaments and cul-de-sac felt on rectovaginal exam
     - fixed retroversion of uterus
     - firm, fixed adnexal mass (endometrioma)
     - physical findings not present in adolescent population

Investigations

- definitive diagnosis requires
  - direct visualization of lesions typical of endometriosis at laparoscopy
  - biopsy and histologic exam of specimens (2 or more of: endometrial epithelium, glands, stroma, hemosiderin-laden macrophages)

- laparoscopy
  - mulberry spots: dark blue or brownish-black implants on the uterosacral ligaments, cul-de-sac, or anywhere in the pelvis
  - endometrioma: "chocolate" cysts on the ovaries
  - 'powder-burn' lesions on the peritoneal surface
  - early white lesions and clear blebs
  - peritoneal "pockets"
- CA-125
  - may be elevated in patients with endometriosis

Treatment

- surgical: confirmation of disease is NOT required prior to starting medical management. Asymptomatic endometriosis does not require treatment. Management depends on certainty of the diagnosis, severity of symptoms, extent of disease, desire for future fertility, and impact to GI/GU systems (e.g. intestinal obstruction)
  - medical
    - NSAIDs (e.g. naproxen sodium – Anaprox®)
    - 1st line
      - cyclic/continuous estrogen-progestin (OCP)
      - progestin (IM medroxyprogesterone (Depo-Provera®) or oral dienogest (Visanne®)
      - Mirena® IUS
    - 2nd line
      - 2nd line: GnRH-a example: leuprolide (Lupron®): GnRH agonist (suppresses pituitary)
        - side effects: hot flashes, vaginal dryness, reduced libido
        - can use ≥12 mo with add-back progestin or estrogen
        - danazol (Danocrine®): weak androgen
          - side effects: weight gain, fluid retention, acne, hirsutism, voice change
  - surgical
    - conservative laparoscopy using laser, electrocautery ± laparotomy
    - ablation/resection of implants, lysis of adhesions, ovarian cystectomy of endometriomas
    - definitive: bilateral salpingo-oophorectomy ± hysterectomy
  - ± follow-up with medical treatment for pain control not shown to impact on preservation of fertility
  - best time to become pregnant is immediately after conservative surgery
Adenomyosis

• synonym: “endometriosis interna” (uterine wall may be diffusely involved)

Epidemiology
• 15% of females >35 yr old; found in 20-40% of hysterectomy specimens
• mean age at presentation: 40-50 yr old (older age group than seen in endometriosis)
• adenomyosis is a common histologic finding in asymptomatic patients

Clinical Features
• often asymptomatic
• menorrhagia, secondary dysmenorrhea, pelvic discomfort
• dyspareunia, dyschezia
• uterus symmetrically bulky, usually <14 cm, mobility not restricted, no associated adnexal pathology
• Halban sign: tender, softened uterus on premenstrual bimanual exam

Investigations
• clinical diagnosis
• U/S or MRI can be helpful
• endometrial sampling to rule out other pathology

Treatment
• iron supplements as necessary
• analgesics, NSAIDs
• OCP, medroxyprogesterone (Depo-Provera®)
• GnRH agonists (e.g. leuprolide)
• Mirena® IUS
• low dose danazol 100-200 mg PO OD (trial x 4 mo)
• definitive: hysterectomy (no conservative surgical treatment)

Leiomyomata (Fibroids)

Epidemiology
• diagnosed in approximately 40-50% of pre-menopausal women >35 yr
• more common in African Americans, where they are also larger and occur at earlier age
• common indication for major surgery in females
• minimal malignant potential (1:1,000)
• typically regress after menopause; enlarging fibroids in a postmenopausal woman should prompt consideration of malignancy
  ▪ 50% of leiomyosarcomas originate from within fibroids

Pathogenesis
• estrogen stimulates monoclonal smooth muscle proliferation
• progesterone stimulates production of proteins that inhibit apoptosis
• degenerative changes (occur when tumour outgrows blood supply)
  ▪ fibroids can degenerate, become calcified, have sarcomatous component or obtain parasitic blood supply

Clinical Features
• majority asymptomatic (60%), often discovered as incidental finding on pelvic exam or U/S
• abnormal uterine bleeding (30%): dysmenorrhea, menorrhagia
• pressure/bulk symptoms (20-50%)
  ▪ pelvic pressure/heaviness
  ▪ increased abdominal girth
  ▪ urinary frequency and urgency
  ▪ acute urinary retention (extremely rare but surgical emergency!)
  ▪ constipation, bloating (rare)
• acute pelvic pain
  ▪ fibroid degeneration
  ▪ fibroid torsion (pedunculated subserosal)
• infertility, recurrent pregnancy loss
• pregnancy complications (potential enlargement and increased pain, obstructed labour, difficult C-section)
Investigations

- bimanual exam: uterus asymmetrically enlarged, usually mobile
- CBC: anemia
- U/S: to confirm diagnosis and assess location of fibroids
- sonohysterogram: useful for differentiating endometrial polyps from submucosal fibroids, or if intracavitary growth
- endometrial biopsy to rule out uterine cancer for abnormal uterine bleeding (especially if age >40 yr)
- occasionally MRI is used for pre-operative planning (e.g. before myomectomy)

Treatment

- only if symptomatic, rapidly enlarging, menorrhagia, menometrorrhagia, or intracavitary fibroids
- treat anemia if present
- conservative approach (watch and wait) if
  - symptoms absent or minimal
  - fibroids <6-8 cm or stable in size
  - not submucosal (submucosal fibroids are more likely to be symptomatic)
  - currently pregnant due to increased risk of bleeding (follow-up U/S if symptoms progress)
- medical approach to treat AUB-L
  - antiprostaglandins (ibuprofen, other NSAIDs)
  - tranexamic acid (Cyklokapron*)
  - OCP/Depo-Provera*
  - GnRH agonist: leuprolide (Lupron*), danazol (Danocrine*)
    - short-term use only (6 mo)
    - often used pre-myomectomy or pre-hysterectomy to reduce fibroid size
    - reduced bleeding
  - ulipristal acetate: a partial progesterone receptor agonist
- interventional radiology approach
  - uterine artery embolization (occludes both uterine arteries) → shrinks fibroids by 50% at 6 mo; improves menorrhagia in 90% of patients within 1-2 mo; not an option in women considering childbearing
- surgical approach
  - myomectomy (hysteroscopic, transabdominal, or laparoscopic): preserves fertility
  - hysterectomy (see Hysterectomy, GY9)
  - note: avoid operating on fibroids during pregnancy (due to ↑ vascularity and potential pregnancy loss); expectant management usually best

Contraception

The effect of pregnancy on fibroid size is variable

Ulipristal Acetate vs. Leuprolide Acetate for Uterine Fibroids

NEJM 2012;366:421-432

Study: Phase III, double-blind RCT of the efficacy and side-effect profile of ulipristal acetate versus those of leuprolide acetate for the treatment of symptomatic uterine fibroids before surgery.

Outcomes: Control of uterine bleeding at week 13 was the primary outcome. Secondary outcomes included bleeding pattern, amenorrhea, changes in fibroid/uterine volume, and global pain score.

Patients: 307 premenopausal women with symptomatic fibroids and excessive uterine bleeding were randomly assigned to oral ulipristal acetate (5 mg or 10 mg) or intramuscular injections of leuprolide acetate.

Results: Control of bleeding at week 13 was not significantly different between the treatment groups. All three treatments reduced uterine volume, although this decrease was significantly greater in the leuprolide group (47% reduction) than in the ulipristal groups (20-22%). 40% of the leuprolide group reported moderate-to-severe hot flashes, but only 11% (15 mg) and 10% (10 mg) of the ulipristal groups did.

Conclusions: Oral ulipristal acetate (5 mg or 10 mg) is noninferior to intramuscular leuprolide acetate for control of uterine bleeding due to fibroids, and it had a better side-effect profile.

Counselling the Adolescent about Contraception

More than 90% of adolescent pregnancies are unintended, and —50% of all pregnancies occur within the first 6 mo of initiating sexual activity; in addition, 85% of sexually active women become pregnant within 1 yr if no contraception is used and even some of the least effective contraceptive methods markedly decrease the risk of pregnancy.

Effectiveness: percentage of women reporting no pregnancy after 1 yr of use

## Hormonal Methods

### Combined Oral Contraceptive Pills
- most contain low dose ethinyl estradiol (20-35 μg) plus progestin (norethinedrone, norgestrel, levonorgestrel, desogestrel, norgestimate, drospirenone)
- failure rate (0.3% to 8%) depending on compliance
- monophasic or triphasic formulations (varying amount of progestin throughout cycle)

### Transdermal (Ortho Evra®)
- continuous release of 6 mg norelgestromin and 0.60 mg ethinyl estradiol into bloodstream
- applied to lower abdomen, back, upper arm, buttocks, NOT breast
- worn for 3 consecutive weeks (changed every wk) with 1 wk off to allow for menstruation
- as effective as OCP in preventing pregnancy (>99% with perfect use)
- may be less effective in women >90 kg
- may not be covered by drug plans

### Contraceptive Ring (Nuva Ring®)
- thin flexible plastic ring; releases etonogestrel 120 µg/d and estradiol 15 µg/d
- works for 3 wk then removed for 1 wk to allow for menstruation
- as effective as OCP in preventing pregnancy (98%)
- avoids first pass effect
- side effects: vaginal infections/irritation, vaginal discharge
- may have better cycle control; i.e. decreased breakthrough bleeding

### Starting Hormonal Contraceptives
- thorough history and physical examination, including blood pressure and breast exam
- can start at any time during cycle but ideal if within 5 d of LMP
- follow-up visit 6 wk after hormonal contraceptives prescribed
- pelvic exam not required as STI screening can be done by urine and pap smear screening does not start until >21 yr
### Table 8. Combined Estrogen and Progestin Contraceptive Methods

<table>
<thead>
<tr>
<th>Mechanism of Action</th>
<th>Advantages</th>
<th>Side Effects</th>
<th>Contraindications</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Ovulatory suppression through inhibition of LH and FSH</td>
<td>• Highly effective</td>
<td>• Estrogen-related: Nausea, Breast changes (tenderness, enlargement), Fluid retention/bloating/edema, Weight gain (rare)</td>
<td>• Absolute: Known/suspected pregnancy, Undiagnosed abnormal vaginal bleeding, Prior thromboembolic events, thromboembolic disorders (Factor V Leiden mutation; protein C or S, or antithrombin III deficiency), active thrombophlebitis, Cerebrovascular or coronary artery disease, Estrogen-dependent tumours (breast, uterus), Impaired liver function associated with acute liver disease, Congenital hypertenyglycemia, Smoker age &gt; 35 yr, Migraines with focal neurological symptoms (excluding aura), Uncontrolled HTN</td>
</tr>
<tr>
<td>• Decidualization of endometrium</td>
<td>• Reversible</td>
<td>• Migraine, headaches</td>
<td>Relative: Migraines (non-focal with aura &lt; 1 h), DM complicated by vascular disease, SLE, Controlled HTN, Hyperlipidemia, Sickle cell anemia, Gallbladder disease</td>
</tr>
<tr>
<td>• Thickening of cervical mucus resulting in decreased sperm penetration</td>
<td>• Cycle regulation, Decreased dysmenorrhea and menorrhagia (less anemia), Decreased benign breast disease and ovarian cyst development, Decreased risk of ovarian and endometrial cancer, Increased cervical mucus which may lower risk of STIs, Decreased PMS symptoms, Improved acne, Osteoporosis protection (possibly)</td>
<td>• Progestin-related: Amenorrhea/breakthrough bleeding, Headaches, Breast tenderness, Increased appetite, Decreased libido, Mood changes, HTN, Acne/oily skin*, Hirsutism*</td>
<td>Drug Interactions/Risks: Rifampin, phenobarbital, phenytoin, griseofulvin, primidone, and St. John’s wort can decrease efficacy, requiring use of back-up method</td>

</tbody>
</table>

Missed Combined OCPs

Miss a ≥1 pill in a row in first wk
• Take 1 pill ASAP, and then the next pill at the usual time
• Use back-up contraception for 7 d; EPC may be necessary

Miss a <3 pills in 2nd or 3rd wk of cycle
• Take 1 pill ASAP, and then continue taking one pill daily until the end of the pack
• Do not take placebo (28-d packs) or do not take a hormone free interval (21-d packs)
• Start the next pack immediately after finishing the previous one
• No need for back-up contraception

Miss ≥3 pills during the 2nd or 3rd wk
• Take 1 pill ASAP, and then continue taking one pill daily until the end of the pack
• Don’t take placebo (28-d packs) or do not take a hormone free interval (21-d packs)
• Start the next pack immediately after finishing the previous one
• Use back-up contraception for 7 d; EPC may be necessary

Irregular breakthrough bleeding often occurs in the first few months after starting OCP; usually resolves after three cycles

Selected Examples of Progestin-Only Methods

Progestin-Only Pill ("minipill")
- Micronor® 0.35 mg norethindrone
- taken daily at same time of day to ensure reliable effect; no pill free interval
- higher failure rate (1.1-13% with typical use, 0.51% with perfect use) than other hormonal methods
- ovulation inhibited in 60% of women; most have regular cycles (but may cause oligo/a menorrhea)
- highly effective if also post-partum breastfeeding, or if >35 yr

Depo-Provera®
- injectable depot medroxyprogesterone acetate
- dose 150 mg IM q12-14wk (convenient dosing)
- initiate within 5 d of beginning of normal menses, immediately postpartum in breastfeeding non-breastfeeding women
- irregular spotting progresses to complete amenorrhea in 70% of women (after 1-2 yr of use)
- highly effective 99%; failure rate 0.3%
- side effect: decreased bone density (may be reversible)
- disadvantage: restoration of fertility may take up to 1-2 yr

*Cervical swabs for gonorrhea and chlamydia should be done prior to insertion

Intrauterine Device

Steroidal Contraceptives and Bone Fractures in Women: Evidence from Observational Studies
Cochrane DB Syst Rev 2012;3:CD008480

Purpose: To review evidence from observational studies of hormonal contraceptive use and the risk of bone fracture.

Selection Criteria: Cohort and case-control studies of hormonal contraceptive use with fracture risk as the primary outcome.

Results: 7 case-control and 7 cohort studies. Overall, little evidence for an association between OCP use and fracture risk. One study reported increased fracture risk for ever-use of DMPA (OR 1.14, 95% CI 1.01-1.26) and the second also noted increased risk for any past use of DMPA (OR 1.13, 95% CI 1.07-1.21). One study reported reduced risk for ever-use of hormonal IUD (OR 0.75, 95% CI 0.64-0.87).

Conclusion: Observational studies do not indicate an overall association between OCP use and fracture risk. DMPA users may have an increased fracture risk.

Continuous or Extended Cycle vs. Cyclic Use of Combined Oral Contraceptives for Contraception

Background: The efficacy and side effects of cyclic administration or extended use (longer periods of active pills and/or shorter periods placebo) or continuous use (uninterrupted active pill administration) of combination oral contraceptives (COC) are unclear.

Study: Systematic review of randomized clinical trials comparing continuous or extended vs. cyclic COC administration.

Findings: Eight RCTs met inclusion criteria.
- No difference in efficacy of pregnancy prevention.
- No difference in compliance with dosing schedules.
- Extended cycle use lowered prevalence of menstrual symptoms (e.g. headaches, pain, fatigue).
- No difference in bleeding patterns, but continuous use may improve over time.

Depot Medroxyprogesterone Acetate and Bone Effects
ACOG Committee Opinion 415, 2008
Obstet Gynecol 2008;112:127-30
- The effect of DMPA on BMD should neither prevent practitioners from prescribing DMPA nor limit its use to 2 consecutive yr.
- The greatest loss of BMD occurs in the first 1-2 yr of DMPA use.
- Contraceptive implants and intrauterine devices that do not affect BMD should be considered as first-line for adolescents.
- Inform patients about benefits and the potential risks of DMPA, and encourage daily exercise, calcium and vitamin D intake.
- Routine BMD monitoring is not recommended for DMPA users.
## Emergency Postcoital Contraception

<td>• Mirena® IUS cannot be used as EPC</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Follow-up

- 3–4 wk post treatment to confirm efficacy (confirmed by spontaneous menses or pregnancy test)
- contraception counseling

## Termination of Pregnancy

### Definition
- active termination of a pregnancy before fetal viability (usually <500 g or <20 wk GA)

### Indications
- inability to carry a pregnancy to term due to medical or social reasons (including patient preference)

### Management
- **medical**
  - <9 wk: methotrexate + misoprostol
  - >12 wk: prostaglandins (intra- or extra-amniotically or IM) or misoprostol
- **surgical**
  - <12 wk: dilatation + vacuum aspiration ± curettage
  - >12 wk: dilatation and evacuation, early induction of labour
- common complications: pain or discomfort
- less common complications: hemorrhage, perforation of uterus, laceration of cervix, risk of infertility, infection/endometritis, Asherman's syndrome (adhesions within the endometrial cavity causing amenorrhea/infertility), retained products of conception
- counselling
  - supportive and counselling services
  - future contraception and family planning services
  - ensure follow-up

Any OCP can be used as EPC; 100 µg ethinyl estradiol PO q12h x 2 doses
- Levonorgestrel emergency contraception regimens are more effective and cause fewer side effects than the Yuzpe regimen
- Levonorgestrel emergency contraception single dose (1.5 mg) and the 2-dose levonorgestrel regimen (0.75 mg 12 h apart) have similar efficacy with no difference in side effects

CMA Policy (1988)
“Induced abortion should be uniformly available to all women in Canada” and "there should be no delay in the provision of abortion services"

Terminations are generally done until the stage of viability (~23.5 wk), although this varies depending on the provider
Pregnancy-Related Complications

Spontaneous Abortions

• see Termination of Pregnancy, for therapeutic abortions

Table 13. Classification of Spontaneous Abortions

<table>
<thead>

Ectopic Pregnancy

Definition

• embryo implants outside of the endometrial cavity

Figure 13. Sites of ectopic pregnancy implantation

Amphullary (70%) >> isthmal (12%) > fimbrial (11%) > ovarian (3%) > interstitial (2%) > abdominal (1%)

Epidemiology

• 1/100 pregnancies
• fourth leading cause of maternal mortality, leading cause of death in first trimester
• increase in incidence over the last 3 decades
• three commonest locations for ectopic pregnancy: ampullary (70%), isthmic (12%), fimbrial (11%)
Etiology
- 50% due to damage of fallopian tube cilia following PID
- intrinsic abnormality of the fertilized ovum
- conception late in cycle
- transmigration of fertilized ovum to contralateral tube

Risk Factors
- previous ectopic pregnancy
- gynecologic
  - current IUD use – increased risk of ectopic if pregnancy occurs
  - history of PID (especially infection with C. trachomatis), salpingitis
  - infertility
  - infertility treatment (IVF pregnancies following ovulation induction [7% ectopic rate])
- previous procedures
  - any surgery on fallopian tube (for previous ectopic, tubal ligation, etc.)
  - abdominal surgery for ruptured appendix, etc.
- smoking
- structural
  - uterine leiomyomas
  - adhesions
  - abnormal uterine anatomy (e.g. T-shaped uterus)

Investigations
- serial β-hCG levels; normal doubling time with intrauterine pregnancy is 1.6-2.4 d in early pregnancy
- rise of <20% of β-hCG is 100% predictive of a non-viable pregnancy
- prolonged doubling time, plateau, or decreasing levels before 8 wk implies nonviable gestation but does not provide information on location of implantation
- 85% of ectopic pregnancies demonstrate abnormal β-hCG doubling
- ultrasound
  - U/S is only definitive if fetal cardiac activity is detected in the tube or uterus
  - specific finding on transvaginal U/S is a tubal ring
- laparoscopy (sometimes used for definitive diagnosis)

Treatment
- goals of treatment: conservative (preserve tube if possible), maintain hemodynamic stability
- surgical = laparoscopy
  - linear salpingostomy an option if tube salvageable
  - salpingectomy if tube damaged or ectopic is ipsilateral recurrence
- 15% risk of persistent trophoblast; must monitor β-hCG titres weekly until they reach non-detectable levels
- consider Rhogam® if Rh negative
- may require laparotomy if patient is unstable, extensive abdominal surgical history, etc.
- medical = methotrexate (for indications see Figure 4)
  - use 50 mg/m² body surface area; given in a single IM dose
  - this is 1/5 to 1/6 chemotherapy dose, therefore minimal side effects (reversible hepatic dysfunction, diarrhea, gastritis, dermatitis)

DDX of Lower Abdominal Pain
• Urinary tract: UTI, kidney stones
• GI: diverticulitis, appendicitis
• Gyn: endometriosis, PID, fibroid (degenerating, infarcted, torsion), ovarian torsion, ovarian neoplasm, ovarian cyst, pregnancy-related

Clinical Features of Ectopic Pregnancy
4Ts and 1S
- Temperature >38°C (20%)
- Tenderness: abdominal (80%) ± rebound (45%)
- Tenderness on bimanual examination, cervical motion tenderness
- Tissue: palpable adnexal mass (50%) (half have contralateral mass due to lutein cyst)
- Signs of pregnancy (e.g. Chadwick’s sign, Hegar’s sign)

Management of Abortions
• Always rule out an ectopic
• Always check Rh; if negative, give Rhogam®
• Always ensure patient is hemodynamically stable
follow β-hCG levels weekly until β-hCG is non-detectable
- plateau or rising levels suggest persisting trophoblastic tissue (requires further treatment)
- 82-95% success rate, but up to 25% will require a second dose
- tubal patency following methotrexate treatment approaches 80%

Prognosis
- 9% of maternal deaths during pregnancy
- 40-60% of patients will become pregnant again after surgery
- 10-20% will have subsequent ectopic pregnancy

Infertility

Epidemiology
- 10-15% of couples
- must investigate both members of the couple

Female Factors

Etiology
- ovulatory dysfunction (15-20%)
  - hypothalamic (hypothalamic amenorrhea)
  - stress, poor nutrition, excessive exercise (even with presence of menstruation)
  - PCOS
  - ovarian
  - premature ovarian failure
  - luteal phase defect (poor follicle production, premature corpus luteum failure, failed uterine lining response to progesterone), poorly understood
  - systemic diseases (thyroid, Cushing’s syndrome, renal/hepatic failure)
  - congenital (Turner’s syndrome, gonadal dysgenesis or gonadotropin deficiency)
- tubal factors (20-30%)
  - PID
  - adhesions (previous surgery, peritonitis, endometriosis)
  - ligation/occlusion (e.g. previous ectopic pregnancy)
- uterine factors (<5%)
  - congenital anomalies, bicornuate uterus, septate uterus, prenatal DES exposure
  - intrauterine adhesions (e.g. Asherman’s syndrome)
  - infection (endometritis, pelvic TB)
  - fibroids/polyps (particularly intrauterine)
  - endometrial ablation
  - cervical factors (5%)
  - hostile or acidic cervical mucus
  - anti-sperm antibodies
  - structural defects (cone biopsies, laser or cryotherapy)
- endometriosis (15-30%)
- multiple factors (30%)
- unknown factors (10-15%)

Investigations
- ovulatory
  - day 3: FSH, LH, TSH, prolactin ± DHEA, free testosterone (if hirsute) add estradiol for proper FSH interpretation
  - day 21-23: serum progesterone to confirm ovulation
  - initiate basal body temperature monitoring (biphasic pattern)
  - postcoital test: evaluate mucus for clarity, pH, spinnbarkeit/fibrosity (rarely done)
- tubal factors
  - HSG (can be therapeutic – opens fallopian tube)
  - SHG (can be therapeutic; likely less – opens fallopian tube)
  - laparoscopy with dye insufflation (or tubal dye test)
- peritoneal/uterine factors
  - HSG/SHG, hysteroscopy
  - other
  - karyotype

requirements for Conception
- Ovary
- Tube
- Cervix
- Endometrium
- Sperm

When Should Investigations Begin?
- < 35 yr: after 1 yr of regular unprotected intercourse
- 35-40 yr: after > 6 mo
- > 40 yr: immediately
- Earlier if
  - history of PID
  - history of infertility in previous relationship
  - prior pelvic surgery
  - chemotherapy/radiation in either partner
  - recurrent pregnancy loss
  - moderate-severe endometriosis

Controversial and Evolving Ethical Issues
- Infertility demands non-judgmental discussion
- Ethical issues surrounding therapeutic donor insemination in same sex couples, surrogacy, donor gametes, and other advanced reproductive technologies are still evolving and remain controversial
- If the doctor finds that certain treatment options lie outside of their moral boundaries, the infertile couple should be referred to another physician
Treatment
• education: timing of intercourse in relation to ovulation (from 2 d prior to 2 d following presumed ovulation), every other day
• medical
  • ovulation induction
    • clomiphene citrate (Clomid®): estrogen antagonist that causes a perceived decreased estrogen state, resulting in increased pituitary gonadotropins; causes increased FSH and LH, leading to ovulation induction (works much better if anovulatory)
    • followed by β-hCG for stimulation of ovum release
  • may add
    • bromocriptine (dopamine agonist) if elevated prolactin
    • dexamethasone for hyperandrogenism (adult onset congenital adrenal hyperplasia)
    • metformin (for PCOS)
  • luteal phase progesterone supplementation for luteal phase defect (mechanism not completely understood)
  • ASA (81 mg PO OD) for women with a history of recurrent spontaneous abortions
• surgical/procedural
  • tubuloplasty
  • lysis of adhesions
  • artificial insemination: intracervical insemination (ICI), intrauterine insemination (IUI), intrauterine tuboperitoneal insemination (IUTPI), intratubal insemination (ITI)
  • sperm washing
  • IVF (in vitro fertilization)
  • IFT (intrafallopian transfer)
  • GIFT* (gamete intrafallopian transfer): immediate transfer with sperm after oocyte retrieval
  • ZIFT* (zygote intrafallopian transfer): transfer after 24 h culture of oocyte and sperm
  • TET* (tubal embryo transfer): transfer after >24 h culture
  • ICSI (intracytoplasmic sperm injection)
  • IVM (in vitro maturation)
  • ± oocyte or sperm donors
  • ± pre-genetic screening for single gene defects in karyotype of zygote
  • *Not performed in Canada

Male Factors
• see Urology, U34

Etiology
• varicocele (>40%)
• idiopathic (>20%)
• obstruction (~15%)
• cryptorchidism (~8%)
• immunologic (~3%)

Investigations
• semen analysis and culture
• postcoital (Huhner) test: rarely done

Polycystic Ovarian Syndrome
• also called chronic ovarian androgenism

Etiology

Figure 15. Pathophysiology of polycystic ovarian syndrome
Diagnosis

- Rotterdam diagnostic criteria: 2 of 3 required
  - oligomenorrhea/irregular menses for 6 mo
  - hyperandrogenism
    - clinical evidence - hirsutism or male pattern alopecia or
    - biochemical evidence - raised free testosterone
  - polycystic ovaries on U/S

Clinical Features

- average age 15-35 yr at presentation
- in adolescents, wait at least 1-2 yr to make diagnosis
- abnormal/irregular uterine bleeding, hirsutism, infertility, obesity, virilization
- insulin resistance occurs in both lean and obese patients
- anacneosis nigricans: browning of skin folds in intertriginous zones (indicative of insulin resistance)
- family history of DM

Investigations

- goal of investigations is to identify hyperandrogenism or chronic anovulation; and rule out specific pituitary or adrenal disease as the cause
- laboratory
  - prolactin, 17-hydroxyprogesterone, free testosterone, DHEA-S, TSH, free T₄, androstenedione, SHBG
  - LH:FSH >2:1; LH is chronically high with FSH mid-range or low (low sensitivity and specificity)
  - increased DHEA-S, androstenedione and free testosterone (most sensitive), decreased SHBG
  - transvaginal or transabdominal U/S: polycystic-appearing ovaries ("string of pearls" – 12 or more small follicles 2-9 mm, or increased ovarian volume)
  - tests for insulin resistance or glucose tolerance
    - fasting glucose:insulin ratio <4.5 is consistent with insulin resistance (U.S. units)
    - 75 g OGTT yearly (particularly if obese)
  - laparoscopy
    - not required for diagnosis
    - most common to see white, smooth, sclerotic ovaries with a thick capsule; multiple follicular cysts in various stages of atresia; hyperplastic theca and stroma
    - rule out other causes of abnormal bleeding

Treatment

- cycle control
  - lifestyle modification (decrease BMI, increase exercise) to decrease peripheral estrone formation
  - OCP monthly or cyclic Provera® to prevent endometrial hyperplasia due to unopposed estrogen
  - oral hypoglycemic (e.g. metformin) if type 2 diabetic or if trying to become pregnant
  - tranexamic acid (Cyklokapron®) for menorrhagia only
- infertility
  - medical induction of ovulation: clomiphene citrate, human menopausal gonadotropins (HMG [Pergonal®]), LHRH, recombinant FSH, and metformin
  - metformin may be used alone or in conjection with clomiphene citrate for ovulation induction
  - ovarian drilling (perforate the stroma), wedge resection of the ovary
  - bromocriptine (if hyperprolactinemia)
- hirsutism
  - any OCP can be used
    - Diane 35® (cyproterone acetate): antiandrogenic
    - Yasmin® (drosperone and ethinyl estradiol): spironolactone analogue (inhibits steroid receptors)
  - mechanical removal of hair
    - finasteride (5-a reductase inhibitor)
  - flutamide (androgen reuptake inhibitor)
  - spironolactone: androgen receptor inhibitor

Gynecological Infections

Physiologic Discharge

- clear, white, flocculent, odorless discharge; pH 3.8-4.2
- smear contains epithelial cells, Lactobacilli
- increases with increased estrogen states: pregnancy, OCP, mid-cycle, PCOS, or premenarchal
- if increased in perimenopausal/postmenopausal woman, consider investigation for other effects of excess estrogen (e.g. endometrial cancer)

PCOS may be Confused with

- Late onset congenital adrenal hyperplasia (21-hydroxylase deficiency)
- Cushing’s syndrome
- Ovarian and adrenal neoplasms
- Hyperprolactinemia
- Hypothyroidism

Clinical Signs of Endocrine Imbalance

- Hyperlipidemia
- Adult-onset DM
- Endometrial hyperplasia
- Infertility
- Obesity
- Sleep apnea

Long-Term Health Consequences

- Hyperandrogenemia
- Adult-onset DM
- Hypertension
- NIDDM
- Hypothyroidism
- Hyperlipidemia
- Raynaud's phenomenon
- Hypercoagulability
- Impaired glucose tolerance

Use of Metformin in Polycystic Ovary Syndrome: A Meta-Analysis

Study: This meta-analysis of 17 RCTs assessed the efficacy of metformin or metformin in combination with clomiphene citrate in women with PCOS who were seeking pregnancy.

Main Outcomes: Ovulation, pregnancy, and live birth. Patients: 1,639 patients with PCOS were followed up for up to 12 mo.

Results: Compared to placebo, metformin increased the odds of ovulation (OR 2.94, 95% CI 1.43-6.02). However, when used alone, metformin did not significantly increase the odds of achieving pregnancy (OR 1.56, 95% CI 0.74-3.33). When compared to clomiphene alone, the combination of metformin and clomiphene increased the likelihood of ovulation (OR 4.39, 95% CI 1.94-9.96) and pregnancy (OR 2.67, 95% CI 1.45-4.94). The effect of combination therapy was most prominent in clomiphene-resistant and obese women with PCOS. Furthermore, the combination therapy had a higher likelihood of having a live birth compared to clomiphene alone, but this did not reach significance (OR 1.74, 95% CI 0.79-3.86).

Conclusion: Metformin increases the likelihood of ovulation. When used together with clomiphene, metformin increases the likelihood of both ovulation and pregnancy, especially in clomiphene-resistant and obese women.

Diagnostic Criteria for Polycystic Ovary Syndrome: Pitfalls and Controversies

JOGC 2008;111(4):959-68

At present, there is no clear-cut definition of biochemical hyperandrogenemia, particularly since there is dependence on poor laboratory standards for measuring androgens in women. Clinical signs of hyperandrogenism are ill-defined in women with PCOS, and diagnosis of both hirsutism and polycystic ovarian morphology remains subjective. There is also the inappropriate tendency to assign ovulatory status solely on basis of menstrual cycle history of poorly timed endocrine measurements. Therefore it is important as clinicians to recognize the multi-factorial and complex nature of PCOS and place this in the context of our present diagnostic limitations.
Vulvovaginitis

PREPUBERTAL VULVOVAGINITIS

- clinical features
  - irritation, pruritus
  - discharge
  - vulvar erythema
  - vaginal bleeding (specifically due to Group A Streptococci and Shigella)

- differential diagnosis
  - non-specific vulvovaginitis (25-75%)
  - infections (respiratory, enteric, systemic, sexually acquired)
  - foreign body (toilet paper most common)
  - Candida (if using diapers)
  - pinworms
  - polyps, tumour (ovarian malignancy)
  - vulvar skin disease (lichen sclerosis, condyloma acuminata)
  - trauma (accidental straddle injury, sexual abuse)
  - psychosomatic vaginal complaints (specific to vaginal discharge)
  - endocrine abnormalities (specific to vaginal bleeding)
  - blood dyscrasia (specific to vaginal bleeding)

- etiology
  - infectious
    - poor hygiene, proximity of vagina to anus
    - recent infection (respiratory, enteric, systemic)
    - STI: investigate sexual abuse
  - non-specific
    - lack of protective hair and labial fat pads
    - lack of estrogenization
    - susceptible to chemicals, soaps (bubble baths), medications, and clothing
    - enuresis

- investigations
  - vaginal swab for culture (specifically state that it is a pre-pubertal specimen), pH, wet-mount, and KOH smear in adults only

- treatment
  - enhanced hygiene and local measures (handwashing, white cotton underwear, no nylon tights, no tight fitting clothes, no sleeper pajamas, sitz baths, avoid bubble baths, use mild detergent, eliminate fabric softener, avoid prolonged exposure to wet bathing suits, urination with legs spread apart)
  - A&D® dermatological ointment (vitamin A/D) to protect vulvar skin
  - infectious: treat with antibiotics for organism identified

Table 14. Other Common Causes of Vulvovaginitis in Prepubertal Girls

<td></td>
</tr>
</tbody>
</table>

POSTMENOPAUSAL VAGINITIS/ATROPHIC VAGINITIS

- clinical features
  - dyspareunia
  - postcoital spotting
  - mild pruritus

- investigations
  - atrophy is usually a visual diagnosis: thinning of tissues, erythema, petechiae, bleeding points, dryness on speculum exam
  - rule out malignancy: especially endometrial cancer

- treatment
  - local estrogen replacement (ideal): Premarin® cream, VagiFem® tablets, or Estring®
  - oral or transdermal hormone replacement therapy (if treatment for systemic symptoms is desired)
  - good hygiene
Table 15. Infectious Vulvovaginitis

<tr>
<td>Candida tropicalis (&lt;5%)</td>
<td>Anaerobes: Prevotella, Mobiluncus, Bacteroides</td>
<td></td>
</tr>
</tbody>
</table>

Pathophysiology or Transmission
- Predisposing factors include:
  - Immunosuppressed host (DM, AIDS, etc.)
  - Recent antibiotic use
  - Increased estrogen levels (e.g., pregnancy, OCP)
- Replacement of vaginal Lactobacillus with organisms above
- Sexual transmission

Discharge
- White, "cottage cheese," minimal
- Grey, thin, diffuse
- Yellow-green, malodorous, diffuse, frothy

Other
- 20% asymptomatic
- Fishy odor, especially after coitus
- Occasional irritated tender vulva

Signs/Symptoms
- Intense pruritus
- Swollen, inflamed genitals
- Vulvar burning, dysuria, dyspareunia
- Absence of vulvar/vaginal irritation
- Petechiae on vagina and cervix

pH
- ≤ 4.5
- ≥ 4.5

Saline Wetmount
- KOH wetmount reveals hyphae and spores
- >20% clue cells = squamous epithelial cells dotted with coccobacilli (Gardnerella)
- Paucity of WBC
- Paucity of Lactobacilli
- Positive whiff test: fishy odor with addition of KOH to slide (due to formation of amines)

Treatment
- Clotrimazole, butoconazole, miconazole, terconazole suppositories, and/or creams for 1, 3, or 7 d treatments
- No treatment if non-pregnant and asymptomatic, unless scheduled for pelvic surgery or procedure
- Oral
  - Metronidazole 500 mg PO bid x 7 d
  - Clindamycin 2% 5 g intravaginally at bedtime for 7 d
  - Probiotics (lactobacillus sp.): oral or topical alone or as adjuvant

Other
- Prophylaxis for recurrent infection includes boric acid, vaginal suppositories, luteal phase fluconazole
- Routine treatment of partner(s) not recommended (not sexually transmitted)
- Associated with recurrent preterm labour, preterm birth, and postpartum endometritis
- Need to warn patients on metronidazole not to consume alcohol (disulfiram-like action)
- Routine treatment of partner(s) not recommended (not sexually transmitted)
- Warnings accompanying metronidazole use
- Treat partner(s)

Sexually Transmitted Infections
- see Family Medicine, FM45

CDC Notifiable Diseases
- Chancroid
- Chlamydia
- Gonorrhea
- Hepatitis A, B, C
- HIV
- Syphilis

Risk Factors for STIs
- History of previous STI
- Contact with infected person
- Sexually active individual < 25 yr
- Multiple partners
- New partner in last 3 mo
- Lack of barrier protection use
- Street involvement (homelessness, drug use)
TRICHOMONIASIS
• see Infectious Vulvovaginitis, Table 15, GY27

CHLAMYDIA

Etiology
• Chlamydia trachomatis

Epidemiology
• most common bacterial STI in Canada
• often associated with N. gonorrhoeae

Clinical Features
• asymptomatic (80% of women)
• muco-purulent endocervical discharge
• urethral syndrome: dysuria, frequency, pyuria, no bacteria on culture
• pelvic pain
• postcoital bleeding or intermenstrual bleeding (particularly if on OCP and prior history of good cycle control)
• symptomatic sexual partner

Investigations
• cervical culture or nucleic acid amplification test
• obligate intracellular parasite: tissue culture is the definitive standard
• urine and vaginal tests now available, which are equally or more effective than cervical culture

Treatment
• doxycycline 100 mg PO bid for 7 d or azithromycin 1 g PO in a single dose (may use in pregnancy)
• also treat gonorrhea because of high rate of co-infection
• treat partners
• reportable disease
• test of cure for chlamydia required in pregnancy (cure rates lower in pregnant patients) → retest 3-4 wk after initiation of therapy

Screening
• high risk groups
• during pregnancy
• with initiation of OCP (independent risk factor)

Complications
• acute salpingitis, PID
• Fitz-Hugh-Curtis syndrome (liver capsule inflammation)
• reactive arthritis (male predominance, HLA-B27 associated), conjunctivitis, urethritis
• infertility: tubal obstruction from low grade salpingitis
• ectopic pregnancy
• chronic pelvic pain
• perinatal infection: conjunctivitis, pneumonia

GONORRHEA

Etiology
• Neisseria gonorrhoeae
• symptoms and risk factors same as with chlamydia

Investigations
• Gram stain shows Gram-negative intracellular diplococci
• cervical, rectal, and throat culture (if clinically indicated)

Treatment
• single dose of ceftriaxone 250 mg IM plus azithromycin 1 g PO
• if pregnant: above regimen or 2 g spectinomycin IM plus azithromycin 1 g PO (avoid quinolones)
• also treat chlamydia, because of high rate of co-infection
• treat partners
• reportable disease
• screening as with chlamydia

Test of cure for C. trachomatis and N. gonorrhoeae is not routinely indicated
Repeat testing if symptomatic, if compliance with treatment is uncertain, or if pregnant

STI Testing
• Vaginal swab
  • Tests for bacterial vaginosis, trichomoniasis, candida
• Cervical swab
  • Tests for gonorrhea and chlamydia
HUMAN PAPILLOMAVIRUS

Etiology
- most common viral STI in Canada
- >200 subtypes, of which >30 are genital subtypes
- HPV types 6 and 11 are classically associated with anogenital warts/condylomata acuminata
- HPV types 16 and 18 are the most oncogenic (classically associated with cervical HSIL)
- types 16, 18, 31, 33, 35, 36, 45 (and others) associated with increased incidence of cervical and vulvar intraepithelial hyperplasia and carcinoma

Clinical Features
- latent infection
  - no visible lesions, asymptomatic
  - only detected by DNA hybridization tests
- subclinical infection
  - visible lesion found during colposcopy or on Pap test
- clinical infection
  - visible wart-like lesion without magnification
  - hyperkeratotic, verrucous or flat, macular lesions
  - vulvar edema

Investigations
- cytology (see Cervical Screening Pap Test, GY44)
- koilocytosis: nuclear enlargement and atypia with perinuclear halo
- biopsy of lesions at colposcopy
- detection of HPV DNA subtype using nucleic acid probes (not routinely done but can be done in presence of abnormal Pap test to guide treatment)

Treatment
- patient administered
  - podofilox 0.5% solution or gel bid x 3 d in a row (4 d off) then repeat x 4 wk
  - imiquimod (Aldara®) 5% cream 3x/wk qhs x 16 wk
- provider administered
  - cryotherapy with liquid nitrogen: repeat q1-2wk
  - podophyllin resin in tincture of benzoin: weekly
  - trichloroacetic acid (TCA) or bichloroacetic acid weekly (80-90%); safe in pregnancy
  - surgical removal/laser
  - intralesional interferon

Prevention
- vaccination: Gardasil®, Cervarix® see Table 25, GY46
- condoms may not fully protect (areas not covered, must be used every time throughout entire sexual act)

HERPES SIMPLEX VIRUS OF VULVA

Etiology
- 90% are HSV-2, 10% are HSV-1

Clinical Features
- may be asymptomatic
- initial symptoms: present 2-21 d following contact
- prodromal symptoms: tingling, burning, pruritus
- multiple, painful, shallow ulcerations with small vesicles appear 7-10 d after initial infection (absent in many infected persons); lesions are infectious
- inguinal lymphadenopathy, malaise, and fever often with first infection
- dysuria and urinary retention if urethral mucosa affected
- recurrent infections: less severe, less frequent and shorter in duration (especially with HSV-1)

Investigations
- viral culture preferred in patients with ulcer present, however decreased sensitivity as lesions heal
- cytologic smear (Tzanck smear)
  - multinucleated giant cells, acidophilic intranuclear inclusion bodies
- type specific serologic tests for antibodies to HSV-1 and HSV-2 (not available routinely in Canada)
- HSV DNA PCR
Treatment

- first episode
  - acyclovir 200 mg PO five times daily x 5-10 d, or famciclovir 250 mg PO tid x 7-10 5 d, or valacyclovir 1 g PO bid x 10 d
- recurrent episode
  - acyclovir 200 mg PO five times daily x 5 d, or famciclovir 125 mg PO bid x 5 d, or valacyclovir 500 mg PO bid OR 1 g PO OD x 3 d
- daily suppressive therapy
  - consider if more than 6 recurrences per yr or one every 2 mo
  - acyclovir 400 mg PO bid, or famciclovir 250 mg bid, or valacyclovir 0.5-1 g PO OD
- severe disease
  - consider IV therapy: acyclovir 55 mg/kg IV over 60 min q8h
- education regarding transmission
  - avoid contact from onset of prodrome until lesions have cleared
  - use barrier contraception

SYphilIS

Etiology
- Treponema pallidum

Classifications

- primary syphilis
  - 3-4 wk after exposure
  - painless chancre on vulva, vagina, or cervix
  - painless inguinal lymphadenopathy
  - serological tests usually negative, local infection only
- secondary syphilis (can resolve spontaneously)
  - 2-6 mo after initial infection
  - nonspecific symptoms: malaise, anorexia, headache, diffuse lymphadenopathy
  - generalized maculopapular rash: palms, soles, trunk, limbs
  - condylomata lata: anogenital, broad-based fleshy grey lesions
  - serological tests usually positive
- latent syphilis
  - no clinical manifestations; detected by serology only
- tertiary syphilis
  - may involve any organ system
  - neurological: tabes dorsalis, general paresis
  - cardiovascular: aortic aneurysm, dilated aortic root
  - vulvar gumma: nodules that enlarge, ulcerate and become necrotic (rare)
- congenital syphilis
  - may cause fetal anomalies, stillbirths, or neonatal death

Investigations

- aspiration of ulcer serum or node
- darkfield microscopy (most sensitive and specific diagnostic test for syphilis)
- spirochetes
- non-treponemal screening tests (VDRL, RPR); nonreactive after treatment, can be positive with other conditions
- specific anti-treponemal antibody tests (FTA-ABS, MHA-TP, TP-PA)
- confirmatory tests; remain reactive for life (even after adequate treatment)

Treatment

- treatment of primary, secondary, latent syphilis of <1 yr duration
  - benzathine penicillin G 2.4 million units IM single dose
  - treat partners, reportable disease
- treatment of latent syphilis of >1 yr duration
  - benzathine penicillin G 2.4 million units IM q1wk x 3 wk
- treatment of neurosyphilis
  - IV aqueous penicillin G 3-4 million units IM q4h x 10-14 d
- screening
  - high risk groups
  - in pregnancy (see Obstetrics, Table Infections During Pregnancy, OB30)

Complications

- if untreated, 1/3 will experience late complications

HIV

- see Infectious Diseases, ID28
## Bartholinitis/Bartholin Gland Abscess

**Etiology**
- Often anaerobic and polymicrobial
- *U. urealyticum, N. gonorrhoeae, C. trachomatis, E. coli, P. mirabilis, Streptococcus spp., S. aureus* (rare)
- Blockage of duct

**Clinical Features**
- Unilateral swelling and pain in inferior lateral opening of vagina
- Sitting and walking may become difficult and/or painful

**Treatment**
- Sitz baths, warm compresses
- Antibiotics: cephalexin x 1 wk
- Incision and drainage using local anesthesia with placement of Word catheter (10 French latex catheter) for 2-3 wk
- Marsupialization under general anesthetic – more definitive treatment
- Rarely treated by removing gland

## Pelvic Inflammatory Disease

- Up to 20% of all gynecology-related hospital admissions

**Etiology**
- Causative organisms (in order of frequency)
  - *C. trachomatis*
  - *N. gonorrhoeae*
  - Gonorrhea and chlamydia often co-exist
  - Endogenous flora: anaerobic, aerobic, or both
    - *E. coli, Staphylococcus, Streptococcus, Enterococcus, Bacteroides, Peptostreptococcus, H. influenzae, G. vaginalis*
  - Cause of recurrent PID
  - Associated with instrumentation
  - *Actinomyces israelii* (Gram-positive, non acid-fast anaerobe)
  - 1-4% of PID cases associated with IUDs
  - Others (TB, Gram-negatives, CMV, *U. urealyticum*, etc.)

**Risk Factors**
- Age <30 yr
- Risk factors as for chlamydia and gonorrhea
- Vaginal douching
- IUD (within first 10 d after insertion)
- Invasive gynecologic procedures (D&C, endometrial biopsy)

**Clinical Presentation**
- Up to 2/3 asymptomatic: many subtle or mild symptoms
  - Common
    - Fever >38.3°C
    - Lower abdominal pain and tenderness
    - Abnormal discharge: cervical or vaginal
  - Uncommon
    - N/V
    - Dysuria
    - AUB
  - Chronic disease (often due to chlamydia)
    - Constant pelvic pain
    - Dyspareunia
    - Palpable mass
    - Very difficult to treat, may require surgery
Investigations
- blood work
  - β-hCG (must rule out ectopic pregnancy), CBC, blood cultures if suspect septicemia
- urine R&M
- speculum exam, bimanual exam
  - vaginal swab for Gram stain, C&S
  - cervical cultures for *N. gonorrhoeae*, *C. trachomatis*
  - endometrial biopsy will give definitive diagnosis (rarely done)
- ultrasound
  - may be normal
  - free fluid in cul-de-sac
  - pelvic or tubo-ovarian abscess
  - hydrosalpinx (dilated fallopian tube)
- laparoscopy (gold standard)
  - for definitive diagnosis: may miss subtle inflammation of tubes or endometritis

Treatment
- must treat with polymicrobial coverage
- inpatient if
  - moderate to severe illness
  - atypical infection
  - adnexal mass, tubo-ovarian or pelvic abscess
  - unable to tolerate oral antibiotics or failed oral therapy
  - immunocompromised
  - pregnant
  - adolescent – first episode
  - surgical emergency cannot be excluded (e.g. ovarian torsion)
- PID is secondary to instrumentation
- recommended treatment
  - cefoxitin 2 g IV q6h (no longer available in U.S.A.) + doxycycline 100 mg IV/PO q12h or clindamycin 900 mg IV q8h + gentamicin 2 mg/kg IV/IM loading dose then gentamicin 1.5 mg/kg IV q8h maintenance dose
  - continue IV antibiotics for 24 h after symptoms have improved then doxycycline 100 mg PO bid to complete 14 d
  - percutaneous drainage of abscess under U/S guidance
  - when no response to treatment, laparoscopic drainage
  - if failure, treatment is surgical (salpingectomy, TAH/BSO)
- outpatient if
  - typical findings
  - mild to moderate illness
  - oral antibiotics tolerated
  - compliance ensured
  - follow-up within 48–72 h (to ensure symptoms not worsening)
- recommended treatment
  - ceftriaxone 250 mg IM x 1 + doxycycline 100 mg PO bid x 14 d or cefoxitin 2 g IM x 1 + probenecid 1 g PO + doxycycline 100 mg PO bid ± metronidazole 500 mg PO bid x 14 d
  - ofloxacin 400 mg PO bid x 14 d or levofloxacin 500 mg PO OD x 14 d ± metronidazole 500 mg PO bid x 14 d
  - consider removing IUD after a minimum of 24 h of treatment
  - reportable disease
  - treat partners
  - consider re-testing for *C. trachomatis* and *N. gonorrhoeae* 4-6 wk after treatment if documented infection

Complications of Untreated PID
- chronic pelvic pain
- abscess, peritonitis
- adhesion formation
- ectopic pregnancy
- infertility
  - 1 episode of PID → 13% infertility
  - 2 episodes of PID → 36% infertility
- bacteremia
- septic arthritis, endocarditis
**Toxic Shock Syndrome**

- **Risk Factors**
  - tampon use
  - diaphragm, cervical cap, or sponge use (prolonged use, i.e. >24 h)
  - wound infections
  - post-partum infections
  - early recognition and treatment of syndrome is imperative as incorrect diagnosis can be fatal

- **Clinical Presentation**
  - sudden high fever
  - sore throat, headache, diarrhea
  - erythroderma
  - signs of multisystem organ failure
  - refractory hypotension
  - exfoliation of palmar and plantar surfaces of the hands and feet 1-2 wk after onset of illness

- **Treatment**
  - remove potential sources of infection (foreign objects and wound debris)
  - debride necrotic tissues
  - adequate hydration
  - penicillinase-resistant antibiotics, e.g. cloxacillin
  - steroid use controversial but if started within 72 h, may reduce severity of symptoms and duration of fever

**Surgical Infections**

- **Post-Operative Infections in Gynecological Surgery**
  - pelvic cellulitis
    - common post hysterectomy, affects vaginal vault
    - erythema, induration, tenderness, discharge involving vaginal cuff
    - treat if fever and leukocytosis with broad spectrum antibiotics, i.e. clindamycin and gentamicin
    - drain if excessive purulence or large mass
    - can result in intra-abdominal and pelvic abscess
  - see General Surgery, Post-Operative Fever, GS7

**Sexual Abuse**

- see Family Medicine, FM27, Emergency Medicine, ER27

**Sexuality and Sexual Dysfunction**

**SEXUAL RESPONSE**

1. desire: energy that allows an individual to initiate or respond to sexual stimulation
2. arousal: physical and emotional stimulation leading to breast and genital vasodilation and clitoral engorgement
3. orgasm: physical and emotional stimulation is maximized, allowing the individual to relinquish their sense of control
4. resolution: most of the congestion and tension resolves within seconds, complete resolution may take up to 60 min

**SEXUAL DYSFUNCTION**

**Etiology**

- psychological or emotional: depression, abuse
- hormonal: menopause
- neurologic dysfunction: spinal cord injury
- vascular insufficiency: DM
- drug side effects: β-blockers
- trauma: episiotomy
Classification
• lack of desire (60-70% of women)
• lack of arousal
• anorgasmia (5-10%)
  • primary anorgasmia: never before achieved orgasm under any circumstances
  • secondary anorgasmia: was able to achieve orgasms before but now unable to
• dyspareunia (3-6%): painful intercourse, superficial or deep
  • vaginismus (15%)
  • vulvodynia
  • vaginal atrophy
  • vulvar vestibulitis: associated with history of frequent yeast infections
  • PID

Treatment
• lack of desire: assess factors, rule out organic causes, relationship therapy, sensate focus exercises
• anorgasmia: self-exploration/pleasuring, relationship therapy if needed, bridging techniques (different sexual positions, clitoral stimulation during intercourse)
• dyspareunia
  • Kegel and reverse Kegel exercises
  • dilator treatment
  • comfort with self-exam
  • psychotherapy, other behavioural techniques
  • female on top position: allows for control of speed and duration
  • vestibulitis: remove local irritants, change in contraceptive methods, dietary changes (increased citrate, decreased oxalate), and vestibulectomy (rare)
  • vulvodynia: local moisturization, cold compresses, systemic nerve blocking therapy (amitriptyline, gabapentin), topical anesthetics, estrogen cream
  • pain clinic

Menopause
• see Family Medicine, FM42

Definitions
• lack of menses for 1 yr
• types of menopause
  • physiological; average age 51 yr (follicular atresia)
  • premature ovarian failure; before age 40 (autoimmune disorder, infection, Turner’s syndrome)
  • iatrogenic (surgical/radiation/chemotherapy)

Clinical Features
• associated with estrogen deficiency
  • vasomotor instability (tends to dissipate with time)
    • hot flushes/flashes, night sweats, sleep disturbances, formication, nausea, palpitations
  • urogenital atrophy involving vagina, urethra, bladder
    • dyspareunia, pruritus, vaginal dryness, bleeding, urinary frequency, urgency, incontinence
    • skeletal
    • osteoporosis, joint and muscle pain, back pain
  • skin and soft tissue
    • decreased breast size, skin thinning/loss of elasticity
  • psychological
    • mood disturbance, irritability, fatigue, decreased libido, memory loss

Investigations
• increased levels of FSH (>35 IU/L) on day 3 of cycle (if still cycling) and LH (FSH>LH)
• FSH level not always predictive due to monthly variation; use absence of menses for 1 yr to diagnose
• decreased levels of estradiol (later)

Treatment
• goal is for individual symptom management
  • vasomotor instability
    • HRT (first line), SSRIs, venlafaxine, gabapentin, propranolol, clonidine
    • acupuncture
  • vaginal atrophy
    • local estrogen: cream (Premarin*), vaginal suppository (VagiFem*), ring (Estring*)
    • lubricants (Replens*)
  • urogenital health
    • lifestyle changes (weight loss, bladder re-training), local estrogen replacement, surgery

Menopause Pathophysiology
Degenerating theca cells fail to react to endogenous gonadotropins (FSH, LH)
• Less estrogen is produced
• Decreased negative feedback on hypothalamic-pituitary-adrenal axis
• Increased FSH and adrenal axis
• Stromal cells continue to produce androgens as a result of increased LH stimulation
Hormone Replacement Therapy

- see Family Medicine, FM42
- primary indication is treatment of menopausal symptoms (vasomotor instability)
- keep doses low (e.g. 0.3 mg Premarin®) and duration of treatment short (<5 yr)

HRT Components

- estrogen
  - oral or transdermal (e.g. patch, gel)
  - transdermal preferred for women with hypertriglyceridemia or impaired hepatic function, smokers, and women who suffer from headaches associated with oral HRT
  - low-dose (preferred dose: 0.3 mg Premarin®/25 µg Estradot® patch, can increase if necessary)
- progestin
  - given in combination with estrogen for women with an intact uterus to prevent development of endometrial hyperplasia/cancer

Table 16. Examples of HRT Regimens

<table>
<thead>
<tr>
<th>HRT Regimen</th>
<th>Estrogen Dose</th>
<th>Progestin Dose</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unopposed Estrogen</td>
<td>CEE 0.625 mg PO OD</td>
<td>None</td>
<td>If no intact uterus</td>
</tr>
<tr>
<td>Standard-dose</td>
<td>CEE 0.625 mg PO OD</td>
<td>MPA 2.5 mg PO OD, or micronized progesterone 100 mg PO OD</td>
<td>Withdrawal bleeding may occur in a spotty, unpredictable manner. Usually abates after 6-8 mo due to endometrial atrophy. Once patient has become amenorrheic on HRT, significant subsequent bleeding episodes require evaluation (endometrial biopsy)</td>
</tr>
<tr>
<td>Standard-dose Cyclic</td>
<td>CEE 0.625 mg PO OD</td>
<td>MPA 5-10 mg PO days 1-14 only, or micronized progesterone 200 mg PO OD days 1-14 only</td>
<td>Bleeding occurs monthly after day 14 of progestin (can continue for years). PMS-like symptoms (breast tenderness, fluid retention, headache, nausea) are more prominent with cyclic HRT</td>
</tr>
<tr>
<td>Pulsatile</td>
<td>CEE 0.625 mg PO OD</td>
<td>MPA low-dose</td>
<td>3 d on, 3 d off</td>
</tr>
<tr>
<td>Transdermal</td>
<td>Estroderm®/Estradiol 0.05 mg/d or 0.1 mg/d Estralis®/Estradiol 140 µg/d or 250 µg/d</td>
<td>Estroderm®/MPA 2.5 mg PO OD Estralis®-NEA 50 µg/d</td>
<td>Use patch twice weekly. Can use oral progestins (Estroderm®) or Combined patches available (Estralis®)</td>
</tr>
<tr>
<td>Topical</td>
<td>Estrace® 2.4 g/d x 1-2 wk, 1 g/d maintenance Premarin® 0.5-2 g/d for 21 d then off 7 d for vaginal atrophy, 0.5 g/d for 21 d then off 7 d or twice/wk for dyspareunia Estragyn® 2.4 g/d</td>
<td>Crinone® 4% or 8% (45 or 90 mg applicator)</td>
<td>If simultaneously taking oral estrogen tablet, may need to adjust dosing. If intact uterus, also take progesterone</td>
</tr>
</tbody>
</table>

CEE = conjugated equine estrogen (e.g. Premarin®); MPA = medroxyprogesterone acetate (e.g. Provera®); NEA = norethindrone acetate
Consider lower dose regimens. PREMPRO® 0.45/1.5 (Premarin® 0.45 mg and Provera® 1.5 mg); Estrace® (topical 17β-estradiol) = 0.1 mg active ingredient/g; Premarin® (topical CEE) = 0.625 mg active ingredient/g; Estragyn® (topical estrone) = 1 mg active ingredient/g.
Side Effects of HRT
- abnormal uterine bleeding
- mastodynia – breast tenderness
- edema, bloating, heartburn, nausea
- mood changes (progesterone)
- can be worse in progesterone phase of combined therapy

Contraindications to HRT
- absolute
  - acute liver disease
  - undiagnosed vaginal bleeding
  - known or suspected uterine cancer/breast cancer
  - acute vascular thrombosis or history of severe thrombophlebitis or thromboembolic disease
  - cardiovascular disease
- relative
  - pre-existing uncontrolled HTN
  - uterine fibroids and endometriosis
  - familial hyperlipidemias
  - migraine headaches
  - family history of estrogen-dependent cancer
  - chronic thrombophlebitis
  - DM (with vascular disease)
  - gallbladder disease, hypertriglyceridemia, impaired liver function (consider transdermal estrogen)
  - fibrocystic disease of the breasts

WOMEN’S HEALTH INITIATIVE (launched in 1991)
- two non-randomized studies investigating health risks and benefits of HRT in healthy postmenopausal women 50-79 yr old
- continuous combined HRT (CEE 0.625 mg + MPA 2.5 mg OD) in 16,608 women with an intact uterus
- estrogen-alone (CEE 0.625 mg) in 10,739 women with a previous hysterectomy
- both arms of the trial were stopped early because of evidence of increased risk of breast cancer, stroke, PE, and CHD in the combined HRT arm, and increased risk of stroke with no CHD benefits in the estrogen-alone arm
- the apparent increase in CHD was in disagreement with results of previous observational trial
- results of the WHI study have since been challenged and revision of how CHD was diagnosed led to loss of statistical significance of the results
- benefits and risks reported as number of cases per 10,000 women each year

Table 17. HRT Benefits vs. Risks

<table>
<thead>
<tr>
<th>Benefits</th>
<th>Risks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vasomotor Symptoms: less frequent and severe with use of either combined or estrogen-alone HRT</td>
<td>Stroke: 8 additional cases with combined HRT, and 12 additional cases for estrogen alone (WHI)</td>
</tr>
<tr>
<td>Osteoporosis: 5 fewer cases of hip fractures and 47 fewer cases of all fractures with combined HRT; 6 fewer cases of hip fractures with estrogen alone</td>
<td>DVT/PE: 18 additional cases with combined HRT, and 9 additional cases for estrogen-alone (WHI)</td>
</tr>
<tr>
<td>Colon Cancer: 6 fewer cases with combined HRT (WHI)</td>
<td>CHD: 7 additional MIs with combined HRT (WHI); secondary analysis suggests greater absolute risk for women aged &gt; 70 yr and for women who start HRT &gt; 10 yr post-menopause</td>
</tr>
<tr>
<td>One additional case with estrogen-alone</td>
<td>Breast Cancer: 8 additional cases with combined HRT (WHI)</td>
</tr>
<tr>
<td></td>
<td>Risk only increased after &gt; 5 yr of combined HRT use; no increased risk for estrogen-alone</td>
</tr>
<tr>
<td></td>
<td>Dementia and Mild Cognitive Impairment: 50% greater risk of developing dementia in women taking estrogen-alone after age 65; risk is greater for women taking combined HRT; risk of developing dementia was reduced for women taking HRT before age 65</td>
</tr>
</tbody>
</table>
Pelvic Relaxation/Prolapse

Etiology
- relaxation, weakness, or defect in the cardinal and uterosacral ligaments which normally maintain the uterus in an anteflexed position and prevent it from descending through the urogenital diaphragm (i.e. levator ani muscles)
  - related to
    - vaginal childbirth
    - aging
    - decreased estrogen (post-menopause)
    - following pelvic surgery
    - increased intra-abdominal pressure (obesity, chronic cough, constipation, ascites, heavy lifting)
    - congenital (rarely)
    - ethnicity (Caucasian women > Asian or African women)
    - collagen disorders

GENERAL CONSERVATIVE TREATMENT
(for pelvic relaxation/prolapse and urinary incontinence)
- Kegel exercises
- local vaginal estrogen therapy
- vaginal pessary (intravaginal suspension disc)

Table 18. Pelvic Prolapse

<table>
<thead>
<tr>
<th>Type</th>
<th>Clinical Features</th>
<th>Treatment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cystocele (protrusion of bladder into the anterior vaginal wall)</td>
<td>Frequency, urgency, nocturia • Stress incontinence • Incomplete bladder emptying • associated increased incidence of urinary tract infections – may lead to renal impairment</td>
<td>• See above • Anterior colporrhaphy (“anterior repair”) • Consider additional/alternative surgical procedure if documented urinary stress incontinence</td>
</tr>
<tr>
<td>Enterocele (protrusion of small bowel in upper posterior vaginal wall)</td>
<td>• Contents reduced, neck of peritoneal sac ligated, uterosacral ligaments, and levator ani muscles approximated</td>
<td>• Similar to hemia repair • Contents reduced, neck of peritoneal sac ligated, uterosacral ligaments, and levator ani muscles approximated</td>
</tr>
<tr>
<td>Rectocele (protrusion of rectum into posterior vaginal wall)</td>
<td>Straining/digitation to evacuate stool • Constipation</td>
<td>• See above • Also laxatives and stool softeners • Posterior colporrhaphy (“posterior repair”), plication of endopelvic fascia and perineal muscles approximated in midline to support rectum and perineum (can result in dyspareunia)</td>
</tr>
</tbody>
</table>

Grading of Pelvic Organ Prolapse
- 0 = no descent during straining
- 1 = distal portion of prolapse >1 cm above level of hymen
- 2 = distal portion of prolapse ≤1 cm above or below level of hymen
- 3 = distal portion of prolapse >1 cm below level of hymen but without complete vaginal eversion
- 4 = complete eversion of total length of lower genital tract

Procidentia: failure of genital supports and complete protrusion of uterus through the vagina

© Lori Waters 2008

The only true hernia of the pelvis is an ENTROCELE because peritoneum herniates with the small bowel
Urinary Incontinence

- see Urology, U5

STRESS INCONTINENCE

Definition
- involuntary loss of urine with increased intra-abdominal pressure (coughing, laughing, sneezing, walking, running)

Risk Factors for Stress Incontinence in Women
- pelvic prolapse
- pelvic surgery
- vaginal delivery
- hypoestrogenic state (post-menopause)
- age
- smoking
- neurological/pulmonary disease

Treatment
- see General Conservative Treatment, GY37
- surgical
  - tension-free vaginal tape (TVT), tension-free obturator tape (TOT), prosthetic/fascial slings or retropubic bladder suspension (Burch or Marshall-Marchetti-Krantz procedures)

URGE INCONTINENCE

Definition
- urine loss associated with an abrupt, sudden urge to void
  - “overactive bladder”
  - diagnosed based on symptoms

Etiology
- idiopathic (90%)
- detrusor muscle overactivity (“detrusor instability”)

Associated Symptoms
- frequency, urgency, nocturia, leakage

Treatment
- behaviour modification (reduce caffeine/liquid, smoking cessation, regular voiding schedule)
- Kegel exercises
- medications
  - anticholinergics: oxybutinin (Ditropan®), tolterodine (Detrol®), solifenacin (VESIcare®)
  - tricyclic antidepressants: imipramine

Rule Out Neurological Causes of Urge Incontinence
- MS
- Herniated disc
- DM
ENDOMETRIAL CARCINOMA

Epidemiology
- most common gynecological malignancy in North America (40%); 4th most common cancer in women
- 2-3% of women develop endometrial carcinoma during lifetime
- mean age is 60 yr
- majority are diagnosed in early stage due to detection of symptoms
- 85-90% 5 yr survival for stage I disease
- 70-80% overall 5 yr survival for all stages

Risk Factors
- Type I: excess estrogen (estrogen unopposed by progesterone)
  - obesity
  - PCOS
  - unbalanced HRT (balanced HRT is protective)
  - late menopause
  - estrogen-producing ovarian tumours (e.g. granulosa cell tumours)
  - HNPCC (hereditary non-polyposis colorectal cancer)/Lynch II syndrome
  - tamoxifen
- Type II: not estrogen-related
  - possibly tamoxifen

Classification and Clinical Features
- Type I (well-differentiated endometrioid adenocarcinoma) ~80% of cases
  - postmenopausal bleeding in majority, abnormal uterine bleeding in majority of affected premenopausal women (menorrhagia, intermenstrual bleeding)
- Type II (serous, clear cell carcinoma, grade 3 endometrioid, undifferentiated, carcinosarcoma) ~15% of cases
  - may not present with bleeding in early stage, more likely to present with advanced stage disease with symptoms like ovarian cancer (i.e. bloating, bowel dysfunction, pelvic pressure)

Investigations
- endometrial sampling
  - office endometrial biopsy
  - D&C ± hysteroscopy
- ± pelvic ultrasound (in women where adequate endometrial sampling not feasible without invasive methods)
- ± not acceptable as alternative to pelvic exam or endometrial sampling to rule out cancer

</tbody>
</table>

FIGO: International Federation of Gynecology and Obstetrics
*Note: endocervical glandular involvement is now considered as Stage I (previously Stage II)

Spread
- direct extension is most common
- lymphatic spread to pelvic and para-aortic nodes
- transtubal dissemination to peritoneal cavity
- hematogenous spread (usually to lungs, liver)

Treatment
- surgical: hysterectomy/bilateral salpingo-oophorectomy (BSO) and pelvic washings ± pelvic and para-aortic node dissection ± omentectomy
- goals: diagnosis, staging, treatment, defining optimal adjuvant treatment
- laparoscopic approach associated with improved quality of life (optimal for most patients)
• adjuvant radiotherapy (for improved local control in patients at risk for local recurrence) and adjuvant chemotherapy (in patients at risk for distant recurrence or with metastatic disease): based on presence of poor prognostic factors in definitive pathology
• chemotherapy: often used for recurrent disease (especially if high grade or aggressive histology)
• hormonal therapy: progestins can be used for recurrent disease (especially if low grade)

UTERINE SARCOMA
• rare; 2-6% of all uterine malignancies
• arise from stromal components (endometrial stroma, mesenchymal or myometrial tissues)
• behave more aggressively and are associated with worse prognosis than endometrial carcinoma; 5-yr survival is 35%
• vaginal bleeding is most common presenting symptom

Table 20. Summary of Uterine Sarcoma Subtypes and Features

<table>
<thead>
<tr>

</tr>
<tr>
<td>1. Leiomyosarcoma</td>
<td>• Accounts for 40%</td>
<td>• Histologic distinction from leiomyoma 1. Increased mitotic count (&gt;10 mitoses/10 high power fields) 2. Tumour necrosis 3. Cellular atypia • Rapidly enlarging fibroids in a pre-menopausal woman • Enlarging fibroids in a postmenopausal woman</td>
<td>• Often post-operatively after uterus removed for presumed fibroids • Staging using FIGO 2009 staging for leiomyosarcomas</td>
<td>• Hysterectomy/BSO usually • No routine pelvic lymphadenectomy • Adjuvant chemotherapy may be used if tumour has spread beyond uterus, for palliation • Radiation therapy does not improve local control or survival • Poor outcomes overall, even for early stage disease</td>
</tr>
<tr>
<td>2. Endometrial Stromal Sarcoma (ESS)</td>
<td>• Accounts for 10-15% • Usually presents in perimenopausal or postmenopausal women with abnormal uterine bleeding</td>
<td>• Abnormal uterine bleeding • Good prognosis</td>
<td>• Diagnosed by histology of endometrial biopsy or D&amp;C • Staging using FIGO 2009 staging for ECC and adenosarcoma</td>
<td>• Hysterectomy/BSO (remove ovaries as ovarian hormones may stimulate growth) • No routine pelvic lymphadenectomy • Adjuvant therapy based on stage and histologic features (hormones and/or radiation) • Hormonal therapy (progestins) may be used for metastatic disease • Treatment primarily surgical • Radiation and/or chemotherapy for advanced disease or unresectable disease</td>
</tr>
<tr>
<td>3. Undifferentiated Sarcoma</td>
<td>• Accounts for 5-10%</td>
<td>• Severe nuclear pleomorphism, high mitotic activity, tumour cell necrosis, and lack smooth muscle or endometrial stromal differentiation • Poor prognosis</td>
<td>• Often found incidentally post-operatively for abnormal bleeding</td>
<td>• Treatment primarily surgical • Radiation and/or chemotherapy for advanced disease or unresectable disease</td>
</tr>
<tr>
<td>MIXED TYPE</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>4. Adenosarcoma</td>
<td>• The rarest of the uterine sarcoma • Mixed tumour of low malignant potential</td>
<td>• Present with abnormal vaginal bleeding • Polyloid mass in uterine cavity</td>
<td>• Mixture of benign epithelium with malignant low-grade sarcoma • Often found incidentally at time of hysterectomy for PMB</td>
<td>• Treatment is surgical with TAH/BSO</td>
</tr>
<tr>
<td>RECLASSIFIED</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>5. Carcinosarcoma</td>
<td>• Most common (43%) • Recently reclassified as high grade endometrioid carcinoma with associated metaplasia of the mesenchyme, rather than arising separately from stroma • Surgical staging using FIGO 2009 staging for endometrial cancer</td>
<td>• Both epithelial and stromal malignant elements present • Tend to form bulky polyloid masses that often fill uterine cavity and extend into or through the endocervical canal – often have extraterine disease at presentation</td>
<td>• Diagnosed by histology of endometrial biopsy or D&amp;C</td>
<td>• Usually treated as “high grade endometrial carcinoma” since behaviour and treatment similar (i.e. surgical staging and resection of any gross metastatic disease, adjuvant chemotherapy and radiation)</td>
</tr>
</tbody>

Ovary

BENIGN OVARIAN TUMOURS
- see Table 22
- many are asymptomatic
- usually enlarge slowly, if at all
- may rupture or undergo torsion, causing pain
  - pain associated with torsion of an adnexal mass usually originates in the iliac fossa and radiates to the flank
- peritoneal irritation may result from an infarcted tumour – rare

MALIGNANT OVARIAN TUMOURS
- see Table 22

Epidemiology
- lifetime risk 1.4% (1/70)
- in women >50 yr, more than 50% of ovarian tumours are malignant
- causes more deaths in North America than all other gynecologic malignancies combined
- 4\textsuperscript{th} leading cause of cancer death in women
- 65% epithelial; 35% non-epithelial
- 5-10% of epithelial ovarian cancers are related to hereditary predisposition

Risk Factors (for epithelial ovarian cancers)
- excess estrogen
  - nulliparity
- early menarche/late menopause
- age
- family history of breast, colon, endometrial, ovarian cancer
- race: Caucasian

Protective Factors (for epithelial ovarian cancers)
- OCP: likely due to ovulation suppression (significant reduction in risk even after 1 yr of use)
- pregnancy/breastfeeding
- salpingectomy (prophylactic)
- hysterectomy (without removal of ovaries)
- BSO (prophylactic surgery performed for this reason in high risk women – i.e. BRCA mutation carriers)

Screening
- no effective method of mass screening
- routine CA-125 level measurements or U/S not recommended
  - high false positive rates
- controversial in high risk groups: transvaginal U/S and CA-125, starting age 30 (no consensus on interval)
- familial ovarian cancer (>1 first degree relative affected, BRCA-1 mutation)
- other cancers (e.g. endometrial, breast, colon)
- BRCA-1 or BRCA-2 mutation: may recommend prophylactic bilateral oophorectomy after age 35 or when child-bearing is completed

Clinical Features
- most women with epithelial ovarian cancer present with advanced stage disease since often “asymptomatic” until disseminated disease (symptoms with early stage disease are vague and non-specific)
  - when present, symptoms may include
    - abdominal symptoms (nausea, bloating, dyspepsia, anorexia, early satiety)
    - symptoms of mass effect
      - increased abdominal girth – from ascites or tumour itself
      - urinary frequency
      - constipation
    - postmenopausal bleeding; irregular menses if pre-menopausal (rare)

Low Malignant Potential (also called “Borderline”) Tumours
- pregnancy, OCP, and breastfeeding are protective factors
- ~15% of all epithelial ovarian tumours
- tumour cells display malignant characteristics histologically, but no invasion is identified
- able to metastasize, but not commonly
- treated primarily with surgery (BSO/omental biopsy ± hysterectomy)
- NO proven benefit of chemotherapy
- generally slow growing, excellent prognosis
  - 5 yr survival >99%
  - recurrences tend to occur late, may be associated with low grade serous carcinoma

Ovaries are like GEMS
- Germ-cell
- Epithelial
- Metastatic
- Sex cord stromal

Most (70%) epithelial ovarian cancers present at stage III disease

Risk/Protective Factors for Epithelial Ovarian Cancer
- NO CHILD
- Nulliparity
- OCP, breastfeeding, tubal ligation, hysterectomy (protective)
- Caucasian
- Family History
- Increasing age (>40 yr)
- Late menopause
- Delayed child-bearing

Ovarian Tumour Markers
- Epithelial cell – CA-125
- Stromal
  - Granulosa cell – inhibin
  - Sertoli-Leydig – androgens
- Germ cell
  - Dysgerminoma – LDH
  - Yolk sac – AFP
- Choriocarcinoma – \( \beta \)-hCG
- Immature Teratoma – none
- Embryonal cell – AFP + \( \beta \)-hCG

Diagnosis of ovarian tumours requires surgical pathology

Omental Cake: a term for ascites plus a fixed upper abdominal and pelvic mass; almost always signifies ovarian cancer

Malignant Ovarian Tumour Prognosis
5 Year Survival
- Stage I 75-95%
- Stage II 60-75%
- Stage III 23-41%
- Stage IV 11%

Investigation of Suspicious Ovarian Mass

- women with suspected ovarian cancer based on history, physical, or investigations should be referred to a gynecologic oncologist
  - bimanual examination
  - solid, irregular, or fixed pelvic mass is suggestive of ovarian cancer
  - RMI (Risk of Malignancy Index) is best tool available to assess likelihood of ovarian malignancy and need for pre-operative gynecologic oncology referral (see sidebar, GY44)
  - blood work: CA-125 for baseline, CBC, liver function tests, electrolytes, creatinine
  - radiology
    - bone scan or PET scan not indicated
    - transvaginal ultrasound best to visualize ovaries
    - CT scan abdomen and pelvis to look for metastatic disease
  - try to rule out other primary source if suspected, based on
    - occult blood per rectum: endoscopy ± barium enema
    - gastric symptoms, gastroscopy ± upper GI series
    - abnormal vaginal bleeding, endometrial biopsy to rule out concurrent endometrial cancer
    - colposcopy ± ECC to rule out cervical cancer if abnormal cervix
    - breast lesion identified or risk factors present: mammogram

FIGO = International Federation of Gynecology and Obstetrics
Cervix

BENIGN CERVICAL LESIONS
- Nabothian cyst/inclusion cyst
  - no treatment required
- endocervical polyps
  - treatment is polypectomy (office procedure)

MALIGNANT CERVICAL LESIONS

Epidemiology
- majority are SCC (95%); adenocarcinomas increasing (5%); rare subtypes include small cell, adenosquamous
- 8,000 deaths annually in North America
- annual Pap test reduces a woman's chance of dying from cervical cancer from 0.4% to 0.05%
- average age at presentation: 52 yr old

Etiology
- at birth, vagina is lined with squamous epithelium; columnar epithelium lines only the endocervix and the central area of the ectocervix (original squamocolumnar junction)
- during puberty, estrogen stimulates eversion of a single columnar layer (ectopy), thus exposing it to the acidic pH of the vagina, leading to metaplasia (change of exposed epithelium from squamous to columnar)
  - a new squamocolumnar junction forms as a result
- the transformation zone (TZ) is the area located between the original and the current squamocolumnar junction
- the majority of dysplasias and cancers arise in the TZ of the cervix
- must have active metaplasia in presence of inducing agent (HPV) to get dysplasia
dysplasia → carcinoma in situ (CIS) → invasion
- slow process (~10 yr on average)
- growth is by local extension
- metastasis occurs late

Risk Factors
- HPV infection
  - see Sexually Transmitted Infections, GY28
  - high risk of neoplasia associated with types 16, 18
  - low risk of neoplasia associated with types 6, 11
  - >99% of cervical cancers contain one of the high risk HPV types
- high risk behaviours (risk factors for HPV infection)
  - multiple partners
  - other STIs (HSV, trichomonas)
  - early age at first intercourse
  - high risk male partner
- smoking
- poor screening uptake is the most important risk factor for cervical cancer in Canada
- at-risk groups include
  - immigrant Canadians
  - First Nations Canadians
  - geographically isolated Canadians
  - sex-trade workers
  - low socioeconomic status

Cervical Cancer Screening Guidelines (Pap Test)
- see Family Medicine, FM4

Clinical Features
- SCC: exophytic, fungating tumour
- adenocarcinoma: endophytic, with barrel-shaped cervix
- early
  - asymptomatic
  - discharge: initially watery, becoming brown or red
  - postcoital bleeding
- late
  - 80-90% present with bleeding: either postcoital, postmenopausal or irregular bleeding
  - pelvic or back pain (extension of tumour to pelvic walls)
  - bladder/bowel symptoms
- signs
  - friable, raised, reddened, or ulcerated area visible on cervix

A Risk of Malignancy Incorporating CA125, Ultrasound, and Menopausal Status for the Accurate Pre-Operative Diagnosis of Ovarian Cancer
BJOG 1990;97:922-929
RMI = U x M x CA-125

Ultrasound Findings (1 pt for each)
- Multilocular cyst
- Evidence of solid areas
- Evidence of metastases
- Presence of ascites
- Bilateral lesions
U = 1 (for U/S scores of 0 or 1)
U = 4 (for U/S scores of 2-5)

Menopausal Status
- Postmenopausal: M = 4
- Premenopausal: M = 1

Absolute Value of CA-125 Serum Level
- For RMI>200: Gynecologic oncology referral is recommended

Cervical cancer is most prevalent in developing countries and therefore is the only gynecologic cancer that uses clinical staging; this facilitates consistent international staging with countries that do not have technologies, such as CT and MRI

The Bethesda Classification System is based on cytological results of a Pap test that permits the examination of cells but not tissue structure. Cervical intraepithelial neoplasia (CIN) or cervical carcinoma is a histological diagnosis, requiring a tissue sample via biopsy of suspicious lesions seen during colposcopy.

With development of hypertension early in pregnancy (i.e. <20 wk), think gestational trophoblastic disease.
Figure 22. Decision making chart for Pap test (not applicable for adolescents)
Adapted from: Ontario Cervical Screening Practice Guidelines. May 2012. Cervical screening guidelines unique to each province

Diagnosis
- apply acetic acid and identify acetowhite lesions, punctuation, mosaicism, and abnormal blood vessels to guide cervical biopsy
- endocervical curettage (ECC) if entire lesion is not visible or no lesion visible
- diagnostic excision (LEEP) if
  - lesion extends into endocervical canal
  - positive ECC
  - discrepancy between Pap test results and colposcopy
  - microinvasive carcinoma
- consider cold knife conization (in OR) if glandular abnormality suspected based on cytology or colposcopic findings due to concern for margin interpretation
- tests permitted for FIGO clinical staging include: physical exam (including EUA), cervical biopsy (including cone biopsy), proctoscopy/cystoscopy, IVP, ultrasound liver/kidneys, CXR, LFTs
- MRI and/or CT and/or PET scan often done to facilitate planning of radiation therapy, results do not influence clinical stage

Treatment: Prevention and Management

Prevention: HPV Vaccine
- two vaccines currently approved (Gardasil®, Cervarix®)
• should be administered before onset of sexual activity (i.e. before exposure to virus) for optimal benefit of vaccination
• may be given at the same time as hepatitis B or other vaccines using a different injection site
• not for treatment of active infections
• most women will not be infected with all four types of the virus at the same time, therefore vaccine is still indicated for sexually active females or those with a history of previous HPV infection or HPV-related disease
• conception should be avoided until 30 d after last dose of vaccination

*Gardasil® also covers types 31, 33, 45, 52, and 58; also used to prevent genital warts

### Table 26. Management of Patients Abnormal Cervical Histology and Cervical Cancer

#### Management

**CIN I**
- Preferred option for biopsy-proven CIN I is observation
- Repeat assessment and cytology in T2 mo
- Management according to cytology results
- If after HSIL or AGC
- Cytology and histology should be reviewed
- If discrepancy remains, excisional biopsy may be considered

**CIN II and CIN III**
- Women ≥25 yr
- CIN II or III should be treated
- Excisional procedures preferred for CIN III
- Those with positive margins should have follow-up with colposcopy and directed biopsies and/or endocervical curettage
- Treatment for recurrent CIN II or III should be by excision
- Women <25 yr
- Cytology and histology should be reviewed
- If discrepancy remains, excisional biopsy may be considered

**Stage IA1** (no LVSI)
- Trachelectomy (removal of only the cervix) if future fertility desired (and lesion ≤2 cm)
- Simple hysterectomy if future fertility is not desired

**Stage IA2, IB1**
- Typically treated with radical hysterectomy and pelvic lymphadenectomy (sentinel nodes under study)
- Equal cure rates may be obtained with primary radiation therapy; advantage of surgery: may accurately stage and grade and more targeted adjuvant therapy
- Advantages is that ovaries can be spared if pre-menopausal
- For fertility preservation, may have radical trachelectomy (removal of cervix and parametria) and nodes instead of radical hysterectomy for early-stage disease
- Concurrent chemoradiation therapy if adverse high risk prognostic factors on radical surgical specimen, such as: positive pelvic lymph nodes, positive parametria, and/or positive margins

**Stages IB2 (4 cm), II, III, IV**
- Primary chemoradiation therapy
- PET/CT to grade: evaluate pelvic and para-aortic nodes
- For positive nodes on PET: primary chemoradiation with extended field RT
- Hysterectomy generally not suggested following primary treatment with curative intent

### Abnormal Pap Tests in Pregnancy

- incidence: 1/2,200
- Pap test at all initial prenatal visits
- if abnormal Pap or suspicious lesion, refer to colposcopy
- if diagnostic conization required, should be deferred until second trimester (T2) to minimize risk of pregnancy loss
- if invasive cancer ruled out, management of dysplasia deferred until completion of pregnancy (may deliver vaginally)
- if invasive cancer present, management depends on prognostic factors, degree of fetal maturity, and patient wishes
  - general recommendations in T1: consider pregnancy termination, management with either radical surgery (hysterectomy vs. trachelectomy if desires future fertility), or concurrent chemoradiation therapy
  - recommendations in T2/T3: delay of therapy until viable fetus and C/S for delivery with concurrent radical surgery or subsequent concurrent chemoradiation therapy

### Efficacy of Human Papillomavirus (HPV)-16/18 AS04-Adjuvanted Vaccine Against Cervical Infection and Precancer Caused by Oncogenic HPV Types (PATRICIA): Final Analysis of a Double-Blind, Randomized Study in Young Women

**Study:** Phase III double-blind, controlled RCT.

**Patients:** 18,644 women aged 15-25.

**Selected Outcomes:** Development of HPV-16/18 associated CIN II+, CIN III, and invasive cervical cancer was the primary outcome. Secondary to this were persistence of infections with HPV-16, HPV-18, or other oncogenic HPV types.

**Selected Results:** Efficacy against development of HPV-16/18 associated CIN II+ was 98.1% (p<0.0001). Low levels of cross-protection were observed for persistent infection with HPV-31 and HPV-45 and HPV-31 or HPV-45 associated CIN II+.

**Conclusions:** The HPV-16/18 AS04-adjuvanted vaccine protected against HPV-16/18 associated CIN II+ lesions and lesions associated with HPV-31, HPV-33, and HPV-45.

Vulva

BENIGN VULVAR LESIONS

Non-Neoplastic Disorders of Vulvar Epithelium
- biopsy is necessary to make diagnosis and/or rule out malignancy
- hyperplastic dystrophy (squamous cell hyperplasia)
  - surface thickened and hyperkeratotic
  - pruritus most common symptom
  - typically postmenopausal women
  - treatment: 1% fluorinated corticosteroid ointment bid for 6 wk
- lichen sclerosis
  - subepithelial fat becomes diminished; labia become thin, atrophic, with membrane-like epithelium and labial fusion
  - pruritus, dyspareunia, burning
  - ‘figure of 8’ distribution
  - most common in postmenopausal women but can occur at any age
  - treatment: ultrapotent topical steroid 0.05% clobetasol x 2-4 wk then taper down, can consider long term suppression twice a week
- mixed dystrophy (lichen sclerosis with epithelial hyperplasia)
  - hyperkeratotic areas with areas of thin, shiny epithelium
  - treatment: fluorinated corticosteroid ointment

Tumours
- papillary hidradenoma, nevus, fibroma, hemangioma

MALIGNANT VULVAR LESIONS

Epidemiology
- 5% of genital tract malignancies
- 90% SCC; remainder melanomas, basal cell carcinoma, Paget's disease, Bartholin's gland carcinoma
  - Type I disease: HPV-related (50-70%)
    - more likely in younger women
    - 90% of VIN contain HPV DNA (usually types 16, 18)
  - Type II disease: not HPV-related, associated with current or previous vulvar dystrophy
    - usually postmenopausal women

Risk Factors
- HPV infection
- VIN: precancerous change which presents as multicentric white or pigmented plaques on vulva (may only be visible at colposcopy)
  - progression to cancer rarely occurs with appropriate management
  - treatment: local excision (i.e. superficial vulvectomy ± split thickness skin grafting to cover defects if required) vs. ablative therapy (i.e. laser, cauterization) vs. local immunotherapy (imiquimod)

Clinical Features
- many patients asymptomatic at diagnosis (many also deny or minimize symptoms)
- most lesions occur on the labia majora, followed by the labia minora (less commonly on the clitoris or perineum)
- localized pruritus or lesion most common
- less common: raised red, white or pigmented plaque, ulcer, bleeding, discharge, pain, dysuria
- patterns of spread
  - local
  - groin lymph nodes (usually inguinal → pelvic nodes)
  - hematogenous

Investigations
- ± colposcopy
- ALWAYS biopsy any suspicious lesion

Prognosis
- depends on stage – particularly nodal involvement (single most important predictor followed by tumour size)
- lesions >4 cm associated with poorer prognosis
- overall 5 yr survival rate: 79%
Vagina

BENIGN VAGINAL LESIONS

- inclusion cysts
  - cysts form at site of abnormal healing of laceration (e.g. episiotomy)
  - no treatment required
- endometriosis
  - dark lesions that tend to bleed at time of menses
  - treatment: excision
- Gartner's duct cysts
  - remnants of Wolffian duct, seen along side of cervix
  - treatment: conservative unless symptomatic
- urethral diverticulum
  - can lead to recurrent urethral infection, dyspareunia
  - treatment: surgical correction if symptomatic

MALIGNANT VAGINAL LESIONS

Epidemiology

- primary carcinomas of the vagina represent 2-3% of malignant neoplasms of the female genital tract
- 80-90% are SCC
- more than 50% diagnosed between 70-90 yr old

Risk Factors

- associated with HPV infection (analogous to cervical cancer)
- increased incidence in patients with prior history of cervical and vulvar cancer

Investigations

- cytology
  - significant false negative rate for existing malignancy (i.e. if gross lesion present, biopsy!)
- colposcopy
- Schiller test (normal squamous epithelium takes up Lugol's iodine)
- biopsy, partial vaginectomy (wide local excision for diagnosis)
- rule out disease on cervix, vulva, or anus (most vaginal cancers are actually metastatic from one of these sites)
- staging

Clinical Features

</tbody>
</table>

Fallopian Tube

- least common site for carcinoma of female reproductive system (0.3%)
- usually serous epithelial carcinoma
- recently considered to be origin of serous ovarian cancer
- more common in fifth and sixth decade

Clinical Features

- classic triad present in minority of cases, but very specific
  - watery discharge (most specific) = "hydrops tubae profuens"
  - vaginal bleeding or discharge in 50% of patients
  - crampy lower abdominal/pelvic pain
- most patients present with a pelvic mass (see Ovarian Tumours, GY41 for guidelines regarding diagnosis/investigation)

Treatment

- as for malignant epithelial ovarian tumours
Gestational Trophoblastic Disease/Neoplasia

- refers to a spectrum of proliferative abnormalities of the trophoblast

Epidemiology
- 1/1,000 pregnancies
- marked geographic variation – as high as 1/125 in Taiwan
- 80% benign, 15% locally invasive, 5% metastatic
- cure rate >95%

HYDATIDIFORM MOLE (Benign GTD)

Complete Mole
- most common type of hydatidiform mole
- diffuse trophoblastic hyperplasia, hydropic swelling of chorionic villi, no fetal tissues, or membranes present
- 46XX or 46XY, chromosomes completely of paternal origin (90%)
- 2 sperm fertilize empty egg or 1 sperm with reduplication
- 15-20% risk of progression to malignant sequelae
- risk factors
  - geographic (South East Asia most common)
  - others (maternal age >40 yr, β-carotene deficiency, vitamin A deficiency) – not proven
- clinical features
  - often present during apparent pregnancy with abnormal symptoms/findings
    - vaginal bleeding (97%)
    - excessive uterine size for LMP (51%)
    - theca-lutein cysts >6 cm (50%)
    - preeclampsia (27%)
- β-hCG >100,000 IU/L

Partial (or Incomplete) Mole
- focal trophoblastic hyperplasia and hydropic villi are associated with fetus or fetal parts
- often triploid (XXY, XYY, XXX) with chromosome complement from both parents
  - usually related to single ovum fertilized by two sperm
- low risk of progression to malignant sequelae (<4%)
- associated with fetus, which may be growth-restricted, and/or have multiple congenital malformations
- clinical features
  - typically present similar to threatened/spontaneous/missed abortion
  - pathological diagnosis often made after D&C

Investigations
- quantitative β-hCG levels (tumour marker) abnormally high for gestational age
- U/S findings
  - if complete: no fetus (classic “snow storm” due to swelling of villi)
  - if partial: molar degeneration of placenta ± fetal anomalies, multiple echogenic regions corresponding to hydropic villi, and focal intrauterine hemorrhage
- CXR (may show metastatic lesions)
- features of molar pregnancies at high risk of developing persistent GTN post-evacuation
  - local uterine invasion as high as 31%
  - β-hCG >100,000 IU/L
  - excessive uterine size
  - prominent theca-lutein cysts

Treatment
- suction D&C with sharp curettage and oxytocin
- Rhogam® if Rh negative
- consider hysterectomy (if patient no longer desires fertility)
- prophylactic chemotherapy of no proven benefit
- chemotherapy for GTN if develops after evacuation

Follow-Up
- contraception required to avoid pregnancy during entire follow-up period
- serial β-hCGs (as tumour marker) every week until negative x 3 (usually takes several wk), then monthly for 6-12 mo prior to trying to conceive again
- increase or plateau of β-hCG indicates GTN → patient needs chemotherapy

With development of hypertension early in pregnancy (i.e. <20 wk), think gestational trophoblastic disease
GTN (MALIGNANT GTD)

Invasive Mole or Persistent GTN
- diagnosis made by rising or plateau in $\beta$-hCG, development of metastases following treatment of documented molar pregnancy
- histology: molar tissue from D&C
- metastases are rare (4%)

Choriocarcinoma
- often present with symptoms from metastases
- highly anaplastic, highly vascular
- no choriionic villi, elements of syncytiotrophoblast and cytotrophoblast
- may follow molar pregnancy, abortion, ectopic, or normal pregnancy

Placental-site Trophoblastic Tumour
- rare aggressive form of GTN
- abnormal growth of intermediate trophoblastic cells
- low $\beta$-hCG, production of human placental lactogen (hPL), relatively insensitive to chemotherapy

CLASSIFICATION of GTN
- non-metastatic
  - $\sim 15\%$ of patients after molar evacuation
  - may present with abnormal bleeding
  - all have rising or plateau of $\beta$-hCG
  - negative metastases on staging investigations
- metastatic
  - 4% patients after treatment of complete molar pregnancy
  - metastasis more common with choriocarcinoma which tends toward early vascular invasion and widespread dissemination
  - if signs or symptoms suggest hematogenous spread, do not biopsy (they bleed)
    - lungs (80%): cough, hemoptysis, CXR lesion(s)
    - vagina (30%): vaginal bleeding, "blue lesions" on speculum exam
    - pelvis (20%): rectal bleeding (if invades bowel), U/S lesion(s)
    - liver (10%): elevated LFTs, U/S or CT findings
    - brain (10%): headaches, dizziness, seizure (symptoms of space-occupying lesion), CT/MRI findings
  - highly vascular tumour $\rightarrow$ bleeding $\rightarrow$ anemia
  - all have rising or plateau of $\beta$-hCG
  - classification of metastatic GTN
    - divided into good prognosis and bad prognosis
    - features of bad prognosis
      - long duration (>4 mo from antecedent pregnancy)
      - high pre-treatment $\beta$-hCG titre: >100,000 IU/24 h urine or >40,000 IU/L of blood
      - brain or liver metastases
      - prior chemotherapy
      - metastatic disease following term pregnancy
    - good prognosis characterized by the absence of each of these features

Investigations – For Staging
- blood work: CBC, electrolytes, creatinine, $\beta$-hCG, TSH, LFTs
- imaging: CXR, U/S pelvis, CT abdo/pelvis, CT brain
- if suspect brain metastasis but CT brain negative, consider lumbar puncture for CSF $\beta$-hCG
- ratio of plasma $\beta$-hCG:CSF $\beta$-hCG <60 indicates metastases

Table 28. FIGO Staging and Management of Malignant GTN

<table>
<thead>
<tr>
<th>Stage</th>
<th>Findings</th>
<th>Management</th>
</tr>
</thead>
</table>
| I     | Disease confined to uterine corpus | Single agent chemotherapy for low risk disease (WHO score ≤6)  
  1st line: pulsed – actinomycin D (Act-D) IV q2wk  
  Alternatives: MTX-based regimen  
  20% of patients need to switch to alternate single-agent regimen due to failure of $\beta$-hCG to return to normal  
  Combination chemotherapy (EMA-CO: etoposide, MTX, ACT-D, cyclophosphamide, vincristine) if high risk (WHO score ≥7) or if resistant to single agent chemotherapy  
  Can consider hysterectomy if fertility not desired or placental-site trophoblastic tumour |
| II    | Metastatic disease to genital structures | As above |
| III   | Metastatic disease to lungs with or without genital tract involvement | As above |
| IV    | Distant metastatic sites including brain, liver, kidney, GI tract | Usually high risk (EMA-CO) with surgical resection of sites of disease  
  Persistence/resistance to chemotherapy  
  Consider radiation for brain mets |

### Follow-up (for GTN)
- contraception for all stages to avoid pregnancy during entire follow-up period
- stage I, II, III
  - weekly β-hCG until 3 consecutive normal results
  - then monthly x 12 mo
- stage IV
  - weekly β-hCG until 3 consecutive normal results
  - then monthly x 24 mo

### Common Medications

<table>
<thead>
<tr>
<th>Drug Name (Brand Name)</th>
<th>Action</th>
<th>Dosing Schedule</th>
<th>Indications</th>
<th>Side Effects (S/E), Contraindications (C/I), Drug Interactions (D/I)</th>
</tr>
</thead>
</table>
| acyclovir (Zovirax®)   | Antiviral; inhibits DNA synthesis and viral replication | First Episode: 400 mg PO tid x 7-10 d  
Recurrent: 400 mg PO tid x 5 d | Genital herpes | S/E: headache, GI upset  
D/I: zidovudine, probenecid |
| bromocriptine (Parlodel®) | Dopaminomimetic Agonist at D₂R  
Antagonist at D₁R | Initial: 1.25-2.5 mg PO qhs with food  
Then: increase by 2.5 mg every 2-7 d as needed until optimal therapeutic response  
Usual Range: 1.5-15 mg OD For IVF:  
Initial: 1.25 mg/d PO between days 4-6 of follicular phase  
Then: 2.5 mg/d until 3 d after onset menstruation | Galactorrhea + amenorrhea  
2° to hyperprolactinemia  
Prolactin-dependent menstrual disorders and infertility  
Prolactin-secreting adenomas (microadenomas, prior to surgery of macroadenomas) IVF | S/E: N/V, headache, postural hypotension, somnolence  
C/I: uncontrolled HTN, pregnancy-induced HTN, CAD, breastfeeding  
D/I: domperidone, macrolides, octreotide |
| clomiphene citrate (Clomid®) | Increases output of pituitary gonadotropins which induces ovulation | 50 mg OD x 5 d  
Try 100 mg or 160 mg OD if ineffective  
3 courses = adequate trial | Patients with persistent ovulatory dysfunction (e.g. amenorrhea, PCOS) who desire pregnancy | S/E: Common – hot flashes, abdominal discomfort, exaggerated cyclic ovarian enlargement, accentuation of Mittelschmerz  
Rare – ovarian hyperstimulation syndrome, multiple pregnancy, visual blurring, birth defects  
C/I: pregnancy, liver disease, hormone-dependent tumours, ovarian cyst, undiagnosed vaginal bleeding |
| clotrimazole (Canesten®) | Antifungal; disrupt fungal cell membrane | Tablet: 100 mg/d intravaginally x 7 d or 200 mg/d x 3 d or 500 mg x 1 dose  
Cream (1 or 2%): 1 applicator intravaginally qhs x 3-7 d  
Topical: apply bid x 7 d | Vulvovaginal candidiasis | S/E: vulvar/vaginal burning |
| danazol (Cyclomen® – CAN)  
(Danocrine® – US) | Synthetic steroid that inhibits pituitary gonadotropin output and ovarian steroid synthesis Has mild androgenic properties | 200-800 mg in 2-3 divided doses Used for 3-6 mo  
Biannual hepatic US required if >6 mo use | Endometriosis  
1° menorrhagia/DUB | S/E: weight gain, acne, mild hirsutism, hepatic dysfunction  
C/I: pregnancy, undiagnosed vaginal bleeding, breastfeeding, severely impaired renal/hepatic/cardiac function, porphyria, genital neoplasia, thromboembolic disease  
D/I: warfarin, carbamazepine, cyclosporine, tacrolimus, anti-hypertensives |

**GTN Diagnosis**
- β-hCG plateau: <10% drop in β-hCG over four values in 3 wk (e.g. days 1, 7, 14, and 21) OR
- β-hCG rise >20% in any two values over two wk or longer (e.g. measure at days 1, 7, 14) OR
- β-hCG persistently elevated >6 mo OR
- Metastases on workup
Table 30. Common Medications (continued)

<table>

| doxycycline            | Tetracycline derivative; inhibit protein synthesis | 100 mg PO bid x 7 d | Chlamydia, gonococcal infection, syphilis | S/E: GI upset, hepatotoxicity
C/I: pregnancy, severe hepatic dysfunction
D/I: warfarin, digoxin |
| fluconazole (Diflucan®) | Antifungal; disrupt fungal cell membrane | 150 mg PO x 1 dose | Vulvovaginal candidiasis unresponsive to clotrimazole | S/E: headache, rash, N/V, abdominal pain, diarrhea
D/I: terfenadine, cisapride, astemizole, hydrochlorothiazide, phenytoin, warfarin, rifampin |
| leuprolide (Lupron®)   | Synthetic GnRH analog induces reversible hypoestrogenic state | 3.75 mg IM q1mo or 11.25 mg IM q3mo Usually ≤6 mg, check bone density if >6 mg. Retreatment with Lupron® alone not recommended because of effects on bone density | Endometriosis Leiomyomata DUB Precocious puberty | S/E: hot flashes, sweats, headache, vaginitis, reduction in bone density, acne, GI upset
C/I: pregnancy, undiagnosed vaginal bleeding, breastfeeding |
| menotropin (Pergonal®) | Human gonadotropin with FSH and LH effects; induce ovulation and stimulate ovarian follicle development | 75-150 U of FSH and LH IM OD x 7-12 d, then 10,000 U hCG one day after last dose | Infertility | S/E: bloating, irritation at injection site, abdominal/pelvic pain, headache, N/V, multiple pregnancy
C/I: primary ovarian failure, intracranial lesion (e.g. pituitary tumour), uncontrolled thyroid/adrenal dysfunction, ovarian cyst (not PCOS), pregnancy, undiagnosed uterine bleeding |
| metronidazole (Flagyl®) | Bactericidal; forms toxic metabolites which damage bacterial DNA | 2 g PO x 1 dose or 500 mg PO bid x 7 d | Bacterial vaginosis, trichomonas vaginitis | S/E: headache, dizziness, N/V, diarrhea, disulfiram-like reaction (flushing, tachycardia, N/V)
C/I: pregnancy (1st trimester)
D/I: cisapride, warfarin, cimetidine, lithium, alcohol, amiodarone, milk thistle, carbamazepine |
| oxybutinin (Ditropan®) | Anticholinergic – relaxes bladder smooth muscle, inhibits involuntary detrusor contraction | 5 or 10 mg/d PO May increase doses by 5 mg weekly to a max of 30 mg/d | Overactive bladder (urge incontinence) | S/E: dry mouth/eyes, constipation, palpitations, urinary retention, dizziness, headache
C/I: glaucoma, GI ileus, severe colitis, obstructive uropathy, use with caution if impaired hepatic/renal function |
| tolterodine (Detrol®)  | Anticholinergic | 1-2 mg PO bid | Overactive bladder (urge incontinence) | S/E: anaphylaxis, psychosis, tachycardia, dry mouth/eyes, headache, constipation, urinary retention, chest pain, abdominal pain
C/I: glaucoma, gastric/urinary retention, use with caution if impaired hepatic/renal function |
| tranexamic acid (Cyklokapron®) | Anti-fibrinolytic, reversibly inhibits plasminogen activation | 1-1.5 g tid-qid for first 4 d of cycle Max 4 g/d Ophthalmic check if used for several wk | Menorrhagia | S/E: N/V, diarrhea, dizziness, rare cases of thrombosis, abdominal pain, MSK pain
C/I: thromboembolic disease, acquired disturbances of colour vision, subarachnoid hemorrhage, age < 15 yr |
| ulipristal acetate (Fibristol®) | Selective progesterone receptor modulator (SPRM) | 5 mg PO OD for max 3 mo; first tablet taken anytime during first 7 days of menstruation | Leiomyoma (pre-operative) | S/E: headache, hot flushes, constipation, vertigo, endometrial thickening
C/I: pregnancy, undiagnosed vaginal bleeding, any gynecomancer |
| urofollitropin (Metrodin®) | FSH | 75 U/d SC x 7-12 d | Ovulation induction in PCOS | S/E: ovarian enlargement or cysts, edema and pain at injection site, arterial thromboembolism, fever, abdominal pain, headache, multiple pregnancy
C/I: primary ovarian failure, intracranial lesion (e.g. pituitary tumour), uncontrolled thyroid/adrenal dysfunction, ovarian cyst (not PCOS), pregnancy, abnormal uterine bleeding |
| combined oral contraceptive pill (OCP) | Ovulatory suppression by inhibiting LH and FSH Decidualization of endometrium Thickening of cervical mucus to prevent sperm penetration | | Contraception Disorders of menstruation | See Tables 8-12 |
| intrauterine device (IUD) copper IUD (Nova-T®) progesterone-releasing IUD (Mirena®, Jaydess®) | Copper IUD: mild foreign body reaction in endometrium which is toxic to sperm and alters sperm motility Progesterone-releasing IUD: decidualization of endometrium and thickening of cervical mucus, may suppress ovulation | | Contraceptive effects last 5 yr Same as above | See Table 8-12 |

Basics of Hematology

- over $10^{11}$ blood cells are produced daily
- sites of hematopoiesis in adults: pelvis, sternum, vertebral bodies
- lifespan of mature cells in blood
  - erythrocytes (120 d), neutrophils (~1 d), platelets (10 d), lymphocytes (varies – memory cells persist for years)
- role of lymphoid organs
  - thymus: site of T-cell maturation, involutes with age
  - lymph nodes: sites of B and T-cell activation (adaptive immune response)

</tbody>
</table>

*Normal values may vary depending on site and age

Approach to Interpreting a CBC

1. consider values in the context of individual's baseline
   - up to 5% of population without disease may have values outside “normal” range
   - an individual may display a clinically significant change from their baseline without violating “normal” reference range
2. is one cell line affected or are several?
   - if all lines are low: pancytopenia (see Pancytopenia, H8)
   - if RBCs and platelets are low: consider a MAHA (see H22)
   - if single cell line affected: see Common Presenting Problems, H6

Blood Film Interpretation

RED BLOOD CELLS

Size
- microcytic (MCV <80), normocytic (MCV = 80-100), macrocytic (MCV >100)
- anisocytosis: RBCs with increased variability in size (increased RDW)
  - iron deficiency anemia, hemolytic anemias, myelofibrosis, blood transfusion, MDS

Colour
- hypochromic: increase in size of central pallor (normal = less than 1/3 of RBC diameter)
  - iron deficiency anemia, anemia of chronic disease, sideroblastic anemia
- polychromasia: increased reticulocytes (pinkish-blue cells)
  - increased RBC production by bone marrow

Shape
- poikilocytosis: increased proportion of RBCs of abnormal shape
  - iron deficiency anemia, myelofibrosis, severe B₁₂ deficiency, MDS, burns
Table 2. Common Erythrocyte Shapes

<td>Hereditary, idiopathic, drugs, hypothyroidism (see Sideroblastic Anemia, H16), myelodysplastic syndrome, toxins (lead)</td>
</tr>
</tbody>
</table>

BM = bone marrow; MF = myelofibrosis; MPN = myeloproliferative neoplasm
Illustrations: Ayalah Hutchins and Merry Shiyu Wang 2012
WHITE BLOOD CELLS
• lymphocytes: comprise 30-40% of WBCs; great variation in “normal” lymphocyte morphology
• neutrophils
  ▪ normally only mature neutrophils (with 3-4 lobed nucleus) and band neutrophils (immediate precursor with horseshoe-shaped nucleus) are found in circulation
  ▪ hypersegmented neutrophil: >5 lobes suggests megaloblastic process (B12 or folate deficiency)
  ▪ left shift (increased granulocyte precursors)
    ▪ seen in leukemoid reactions: acute infections, pregnancy, neonates, hypoxia, shock, myeloproliferative neoplasms (CML, MF)
• blasts
  ▪ immature, undifferentiated precursors; associated with acute leukemia, MDS, G-CSF (growth factor that stimulates neutrophil production) use

<td>Atypical Lymphocyte</td>
<td>Pale blue cytoplasm following RBC edges with pink granules</td>
<td>Viruses (particularly EBV) T-cell large granular lymphocyte leukemia (T-LGL)</td>
</tr>
</tbody>
</table>

EBV = Epstein-Barr virus, CLL = chronic lymphocytic leukemia
Illustrations: Ayalah Hutchins and Merry Shiyu Wang 2012

PLATELETS
• small, purple, anuclear cell fragments

Bone Marrow Aspiration and Biopsy

• sites: posterior iliac crest, sternum
• analyses: most often done together
  ▪ aspiration: takes a fluid marrow sample for cellular morphology, flow cytometry, cytogenticis, molecular studies, microbiology (C&S, acid-fast bacilli, PCR)
  ▪ note: differential diagnosis for a “dry tap”: MF, hairy cell leukemia, bone marrow infiltration
  ▪ biopsy: takes a sample of intact bone marrow to assess histology and immunohistochemistry

Indications
• unexplained CBC abnormalities
• diagnosis and evaluation of infiltrating cancers: plasma cell disorders, leukemias, solid tumours
• diagnosis and staging of lymphoma or solid tumours
• evaluate iron metabolism and stores (gold standard, but rarely done)
• evaluate suspected deposition and storage disease (e.g. amyloidosis, Gaucher’s disease)
• evaluate fever of unknown origin, suspected mycobacterial, fungal/parasitic infections, or granulomatous disease
• evaluate unexplained splenomegaly
• confirm normal bone marrow in potential allogenic hematopoietic cell donor

Contraindications
• absolute: untreated hemophilia, severe DIC, infection over skin site
• relative: recent warfarin use with INR >2.0, liver disease with associated coagulopathy
• thrombocytopenia is not a contraindication; may need platelet transfusion prior to procedure
Common Presenting Problems

Anemia

Definition
- a decrease in red blood cell (RBC) mass that can be detected by hemoglobin (Hb) concentration, hematocrit (Hct), and RBC count
  - adult males: Hb < 130 g/L or Hct < 0.41
  - adult females: Hb < 120 g/L or Hct < 0.36 (changes with pregnancy and trimester)

Clinical Features
- history
  - symptoms of anemia (order of onset): fatigue, headache, light-headedness, malaise, weakness, decreased exercise tolerance, dyspnea, palpitations, dizziness, tinnitus, syncope
  - acute vs. chronic, bleeding, systemic illness, diet (Fe, B12 sources), alcohol, family history
  - menstrual history: menorrhagia, menometrorrhagia
  - rule out pancytopenia (recurrent infection, mucosal bleeding, easy bruising)
- physical signs
  - HEENT: pallor in mucous membranes and conjunctiva at Hb < 90 g/L (< 9 g/dL), ocular bruits at Hb < 55 g/L (< 5.5 g/dL), angular chelosis, jaundice
  - cardiac: tachycardia, orthostatic hypotension, systolic flow murmur, wide pulse pressure, signs of CHF
  - dermatologic: pallor in palmar skin creases at Hb < 75 g/L, jaundice (if due to hemolysis), nail changes, glossitis

Investigations
- rule out dilutional anemia (low Hb due to increased effective circulating volume)
- CBC with differential (MCV, RDW, RBC count)
- reticulocyte count - very useful to evaluate for blood cell production problems
- blood film
- rule out nutritional deficit, gastrointestinal and genitourinary disease in iron deficiency anemia
- additional laboratory investigations as indicated (see Microcytic Anemia, H13, Normocytic Anemia, H17, Hemolytic Anemia, H18, and Macrocytic Anemia, H24)

Erythrocytosis

Definition
- an increase in the number of RBCs: Hb > 185 g/L or Hct > 52% (males); Hb > 165 or Hct > 47% (females and African males)

Etiology
- relative/spurious erythrocytosis (decreased plasma volume): diuretics, severe dehydration, burns, “stress” (Gaissböck’s syndrome)
- absolute erythrocytosis
Table 5. Etiology of Erythrocytosis

<table>
<thead>
<tr>
<th>Primary</th>
<th>Secondary</th>
<th>Inappropriate Production of Erythropoietin</th>
</tr>
</thead>
<tbody>
<tr>
<td>Polycythemia Vera (PV)</td>
<td>Physiologic (poor tissue oxygenation/hypoxia)</td>
<td>Tumours</td>
</tr>
<tr>
<td>(see Polycythemia Vera, H41)</td>
<td>Carbon monoxide poisoning</td>
<td>Hepatocellular carcinoma</td>
</tr>
<tr>
<td></td>
<td>Heavy smoking</td>
<td>Renal cell carcinoma</td>
</tr>
<tr>
<td></td>
<td>High altitude</td>
<td>Cerebellar hemangioblastoma</td>
</tr>
<tr>

<td>COPD</td>
<td>Pheochromocytoma</td>
</tr>
<tr>
<td></td>
<td>Sleep apnea</td>
<td>Uterine leiomyoma</td>
</tr>
<tr>
<td></td>
<td>Pulmonary hypertension</td>
<td>Ovarian tumour</td>
</tr>
<tr>
<td>Cardiovascular Disease</td>
<td>R to L shunt (Eisenmenger syndrome)</td>
<td>Other</td>
</tr>
<tr>
<td></td>
<td>RBC defects (Hb with increased O₂ affinity, methemoglobinemia)</td>
<td>Polycystic kidney disease</td>
</tr>
</tbody>
</table>

Clinical Features
- secondary to high red cell mass and hyperviscosity
  - headache, dizziness, tinnitus, visual disturbances, hypertensive symptoms
  - symptoms of angina, congestive heart failure, aquagenic pruritus
- thrombosis (venous or arterial) or bleeding (abnormal platelet function)
- physical findings
  - splenomegaly ± hepatomegaly, facial plethora/ruddy complexion (70%) and/or palms, gout

Investigations
- serum erythropoietin (EPO): differentiates primary (low/normal) from other etiologies (elevated)
- search for tumour as source of EPO as indicated (e.g. abdominal U/S, CT head)
- JAK-2 mutation analysis: positive in >96% of cases of PV
  - only send if low/normal EPO level
- ferritin (iron deficiency can mask the diagnosis)

Treatment
- if primary: see Polycythemia Vera, H41
- if secondary: treat underlying cause
  - O₂ for hypoxemia, CPAP for sleep apnea, surgery for EPO-secreting tumours
  - often cardiologists will be hesitant to treat high Hct in cyanotic patients

Thrombocytopenia

Definition
- platelet count <150 x10⁹/L

Clinical Features
- history: bleeding gums, epistaxis, bleeding post-surgical procedures, metromenorrhagia
- physical exam: bruising, petechiae, ecchymoses, non-palpable purpura
- hemarthrosis and deep muscle hematomas are rarely initial signs in patients with primary hemostatic disorders
- see Disorders of Primary Hemostasis, H27 for complications

Investigations
- CBC and differential
- blood film
  - decreased production: other cell line abnormalities, blasts, hypersegmented PMNs, leukoerythroblastic changes
  - increased destruction: large platelets, schistocytes (seen in MAHA)
  - rule out platelet clumping
- workup for nutritional deficiencies: B₁₂, RBC folate
- PT/INR, aPTT and fibrinogen if DIC suspected
- LFTs

Rule-of-thumb: a deficit in all cell lines suggests decreased production, sequestration, or hemodilution, a deficit in platelets and RBCs suggests non-immune destruction, and an isolated thrombocytopenia suggests an immune-mediated destruction

Must rule out factitious thrombocytopenia: platelet clumping (secondary to EDTA antibodies from collection tube). This can be seen on blood film and confirmed by repeating in a citrated sample (i.e. using a sodium citrate tube to collect blood, rather than EDTA)

In hospitalized patients, drugs and infection account for the majority of cases of thrombocytopenia

Treatments
- life threatening bleeding: platelet transfusion (repeat CBC 1 h post-transfusion to confirm an appropriate rise in counts)
- if secondary: treat underlying cause
- ITP: see Immune Thrombocytopenic Purpura, H27
**Thrombocytosis**

**Definition**
- platelet count >400 x10^9/L
- primary thrombocytosis (uncommon): due to myeloproliferative neoplasms (e.g. CML, polycythemia vera, primary myelofibrosis, essential thrombocytosis; rarely associated with MDS)
- reactive/secondary thrombocytosis (common): acute phase reactant (e.g. surgery, inflammation, infection, trauma, bleeding, iron deficiency, neoplasms, ischemic injury)

**Clinical Features**
- history: trauma, surgery, splenectomy, infection, inflammation, bleeding, iron deficiency, prior diagnosis of chronic hematologic disorder, constitutional symptoms (malignancy)
- vasomotor symptoms: headache, visual disturbances, lightheadedness, atypical chest pain, acral dysesthesia, erythromelalgia, livedo reticularis, aquagenic pruritus
- clotting risk, bleeding risk (rare)
- physical exam: splenomegaly can be seen in myeloproliferative neoplasms (MPNs)

**Investigations**
- CBC, peripheral blood film, serum ferritin concentration
- non-specific markers of infection or inflammation (e.g. CRP, ESR, ferritin)
- if reactive process has been ruled out, bone marrow biopsy may be required to rule out MPN/MDS

**Treatment**
- primary: ASA ± cytoreductive agents (e.g. hydroxyurea, anagrelide, interferon-α)
- secondary: treat underlying cause

**Pancytopenia**

**Definition**
- a decrease in all hematopoietic cell lines

**Clinical Features**
- anemia: fatigue (see Anemia, H6)
- leukopenia: recurrent infections (see Neutropenia, H9)
- thrombocytopenia: mucosal bleeding (see Thrombocytopenia, H7)

**Investigations**
- CBC, peripheral blood film, serum ferritin concentration, B12, RBC folate
- non-specific markers of infection or inflammation (e.g. CRP, ESR, ferritin)
  - work up as per Figure 4 and presenting symptoms/physical exam
- if reactive process has been ruled out, bone marrow biopsy may be required to rule out MDS
Neutrophilia

Definition
• variable definition, but generally an absolute neutrophil count (ANC) >7.7 x 10^9/L (WHO definition)

Etiology
• primary neutrophilia
  ▪ chronic myeloid leukemia (CML)
  ▪ other myeloproliferative disorders: PV, ET, myelofibrosis
  ▪ hereditary neutrophilia (autosomal dominant)
  ▪ chronic idiopathic neutrophilia in otherwise healthy patients
  ▪ leukocyte adhesion deficiency
• secondary neutrophilia
  ▪ stress/exercise/epinephrine: movement of neutrophils from marginated pool into circulating pool
  ▪ obesity
  ▪ infection: leukocytosis with left shift ± toxic granulation, Döhle bodies (intra-cytoplasmic structures composed of agglutinated ribosomes)
  ▪ inflammation: e.g. rheumatoid arthritis (RA), IBD, chronic hepatitis, MI, PE, burns
  ▪ malignancy: hematologic (i.e. marrow invasion by tumour) and non-hematologic (especially large cell lung cancer)
  ▪ medications: glucocorticoids, β-agonists, lithium, G-CSF

Clinical Features
• look for signs and symptoms of fever, inflammation, malignancy to determine appropriate further investigations
  ▪ including lymph nodes and organomegaly
• examine oral cavity, teeth, peri-rectal area, genitals, and skin for signs of infection

Investigations
• CBC and differential: mature neutrophils or bands >20% of total WBC suggests infection/inflammation
• blood film: Döhle bodies, toxic granulation, cytoplasmic vacuoles in infection
• may require bone marrow biopsy if MPN suspected

Treatment
• directed at underlying cause

Neutropenia

Definition
• mild: ANC 1.0-1.5 x 10^9/L
• moderate: ANC 0.5-1.0 x 10^9/L (risk of infection starts to increase)
• severe: ANC <0.5 x 10^9/L
• profound: ANC <0.1 x 10^9/L for >7 d
Etiology

<tr>
<td>Nutritional Deficiency</td>
<td>B12, folate</td>
<td></td>
</tr>
<tr>
<td>Idiopathic</td>
<td>Constitutional neutropenia, benign cyclic neutropenia, cyclical</td>
<td></td>
</tr>
</tbody>
</table>

Clinical Features
- fever, chills (only if infection present)
- infection by endogenous bacteria (e.g. S. aureus, gram negatives from GI and GU tract)
- painful ulceration on skin, anus, mouth, and throat following colonization by opportunistic organisms
- avoid digital rectal exam

Investigations
- dependent on degree of neutropenia, history, and symptoms
- ranges from observation with frequent CBCs to bone marrow aspiration and biopsy

Treatment
- regular dental care: chronic gingivitis and recurrent stomatitis major sources of morbidity
- treatment of febrile neutropenia (see Infectious Diseases, ID45)
- in severe immune-mediated neutropenia, G-CSF may increase neutrophil counts
  - if no response to G-CSF, consider immunosuppression (e.g. steroids, cyclosporine, methotrexate)

Lymphocytosis

Definition
- absolute lymphocyte count >4 x 10^9/L

Etiology
- infection
  - viral infections (majority); particularly mononucleosis
  - TB, pertussis, brucellosis, toxoplasmosis
  - smoking
  - physiologic response to stress (e.g. trauma, status epilepticus)
  - hypersensitivity (e.g. drugs, serum sickness)
  - autoimmune (e.g. rheumatoid arthritis)
  - neoplasm (e.g. ALL, CLL, lymphoma)

Investigations
- peripheral smear

Treatment
- treat underlying cause

Lymphopenia

Definition
- absolute lymphocyte count <1.5 x 10^9/L

Etiology
- idiopathic CD4+ lymphocytopenia
- radiation
- HIV/AIDS, hepatitis B, hepatitis C
- malignancy/chemotherapeutic agents
- malnutrition, alcoholism
- autoimmune disease (e.g. SLE)
Clinical Features
- opportunistic infections (see Infectious Diseases, ID30, ID34)

Treatment
- treat underlying cause
- treat opportunistic infections aggressively and consider antimicrobial prophylaxis (see Infectious Diseases, ID30)

Eosinophilia

Definition
- absolute eosinophil count >0.5 x 10^9/L

Etiology
- primary: due to clonal bone marrow disorder
  - if no primary etiology identified, classified as hypereosinophilic syndrome
  - 6 mo of eosinophilia with no other detectable causes
- secondary
  - most common causes are parasitic (usually helminth) infections and allergic reactions
  - less common causes
    - polyarteritis nodosa, see Rheumatology, RH19
    - respiratory causes (asthma, eosinophilic pneumonia, Churg-Strauss)
    - cholesterol emboli
    - hematologic malignancy: see Chronic Myeloid Leukemia, H40 and Hodgkin Lymphoma, H45
    - adrenal insufficiency, see Endocrinology, E34
    - medications (penicillins)
    - atopic dermatitis

Treatment
- treat underlying cause
- ensure strongyloides serology is collected to rule out infection before initiating steroids for patients at risk

Agranulocytosis

Definition
- severe depletion of granulocytes (neutrophils, eosinophils, basophils) from the blood and granulocyte precursors from bone marrow

Etiology
- associated with medications in 70% of cases: e.g. chemotherapy, clozapine, thionamides (antithyroid drugs), sulfasalazine, and ticlopidine
  - immune-mediated destruction of circulating granulocytes by drug-induced antibodies or direct toxic effects upon marrow granulocytic precursors

Clinical Features
- abrupt onset of fever, chills, weakness, and oropharyngeal ulcers

Prognosis
- high fatality without vigorous treatment

Investigations/Treatment
- discontinue offending drug
- pan-culture and screen for infection if patient is febrile (blood cultures x2, urine culture, and chest x-ray as minimum, initiate broad-spectrum antibiotics)
- consider bone marrow aspirate and biopsy if cause unclear
- consider G-CSF

Leukemoid Reactions

- blood findings resembling those seen in certain types of leukemia which reflect the response of healthy BM to cytokines released due to infection or trauma
- leukocytosis >50 x 10^9/L, marked left shift (myelocytes, metamyelocytes, bands in peripheral blood smear)
Etiology
• important to rule out CML
• differential diagnosis
  ▪ myeloid progenitors: pneumonia, other acute bacterial infections, intoxications, burns, malignant disease, severe hemorrhage or hemolysis
  ▪ lymphoid progenitors: pertussis, TB, infectious mononucleosis
  ▪ monocytic progenitors: TB

Approach to Lymphadenopathy

History
• constitutional/B-symptoms: seen in TB, lymphoma, other malignancies
• growth pattern: acute vs. chronic
• exposures: cats (cat scratch – Bartonella henselae), ticks (Lyme disease – Borrelia burgdorferi), high risk behaviors (HIV)
• joint pain/swelling, rashes (connective tissue disorder)
• pruritus (seen in Hodgkin lymphoma)
• medications (can cause serum sickness → lymphadenopathy)

Physical Exam
• basic assessment: occipital, preauricular, submandibular, cervical, supra-/infra-clavicular, axillary, epitrochlear, inguinal, popliteal nodes
  ▪ characteristics of lymph nodes: location, size, tenderness, consistency, mobility, borders, contour
  ▪ look for signs of infection in regions which lymph nodes drain
• determine if lymphadenopathy is localized or generalized
• localized: typically reactive or neoplastic
  ▪ right (mediastinal, bronchogenic, esophageal cancer)
  ▪ left (gastric, gall bladder, pancreas, renal, testicular/ovarian cancer)
• axillary (cat scratch fever, breast cancer, metastatic cancer)
• epitrochlear (infections, sarcoidosis, lymphoma)
• lower/inguinal (STDs, skin, cervix, vulva/genital cancer)
• generalized: see Table 8
• thorough examination required to assess for systemic disease

Investigations
• CBC and differential, blood film
• ± tuberculin test, HIV RNA, VDRL, Monospot*/EBV serology, ANA, imaging as indicated
• if localized and no symptoms suggestive of malignancy, can observe 3-4 wk (if no resolution → biopsy)
• excisional biopsy is preferred as it preserves node architecture (essential for diagnosing lymphoma)
• in areas difficult to access (retroperitoneal, mediastinal/hilar) multiple core biopsies may be more practical/feasible
• FNA should NOT be used for diagnostic purposes in lymphoproliferative disease (use excisional biopsy instead)
  ▪ helpful for recurrence of solid tumour malignancy

Table 7. Inflammatory vs. Neoplastic Lymph Nodes

<table>
<thead>
<tr>
<th>Feature</th>
<th>Inflammatory</th>
<th>Neoplastic</th>

Constitutional/B-Symptoms
• Unexplained temperature >38°C
• Unexplained weight loss (>10% of body weight in 6 mo)
• Night sweats

Drugs that can cause Lymphadenopathy
• Allopurinol
• Atenolol
• Captopril
• Carbamazepine
• Cephalosporins
• Gold
• Hydralazine
• Penicillin
• Phenytoin
• Primidone
• Pyrimethamine
• Quinidine
• Sulfonamides

The underlined conditions cause massive splenomegaly (spleen crosses midline or reaches pelvis)

**History**
- constitutional symptoms, feeling of fullness in LUQ
- signs or symptoms of infectious disease
- history of liver disease, hemolytic anemia, or high-risk exposures

**Physical Exam**
- jaundice, petechiae
- signs of chronic liver disease
- percussion (Castell’s sign, Traube’s space, Nixon’s method) and palpation
- associated lymphadenopathy or hepatomegaly
- signs of CHF

**Investigations**
- CBC and differential, blood film
- as indicated: liver enzymes/liver function tests, reticulocyte count, Monospot®/EBV, haptoglobin, LDH, infectious, and autoimmune workup
- imaging
  - ultrasound of abdomen/liver to rule out cirrhosis and portal vein thrombosis
  - echo for cardiac function
  - CT to rule out lymphoma

**Microcytic Anemia**
- MCV <80 fL
- see Figure 2, *Approach to Anemia*, H6

**Iron Metabolism**

**Iron Intake (Dietary)**
- average North American adult diet = 10-20 mg iron (Fe) daily
- absorption is 5-10% (0.5-2 mg/d); enhanced by citric acid, ascorbic acid (vitamin C) and reduced by polyphenols (e.g. in tea), phytate (e.g. in bran), dietary calcium, and soy protein
- males have positive Fe balance; up to 20% of menstruating females have negative Fe balance
Iron Absorption and Transport
- dietary iron is absorbed in the duodenum (impaired by IBD, celiac disease, etc.)
- in circulation the majority of non-heme iron is bound to transferrin which transfers iron from enterocytes and storage pool sites (macrophages of the reticuloendothelial system and hepatocytes) to RBC precursors in the bone marrow

Iron Levels
- hepcidin is a hormone produced by hepatocytes that regulates systemic iron levels
  - binds to iron exporter ferroportin (on duodenal enterocytes and reticuloendothelial cells) and induces its degradation, thereby inhibiting iron export into circulation
  - hepcidin production is increased in states of inflammation (thereby mediating anemia of chronic disease) or iron overload, and decreased in states where erythropoiesis is increased (e.g. hemolysis) or oxygen tension is low

Iron Storage
- ferritin
  - ferric iron (Fe³⁺) complexed to a protein called apoferritin (hepatocytes are main ferritin storage site)
  - small quantities are present in plasma in equilibrium with intracellular ferritin
  - also an acute phase reactant – can be spuriously elevated despite low Fe stores in response to a stressor
- hemosiderin
  - aggregates or crystals of ferritin with the apoferritin partially removed
  - macrophage-monocyte system is main source of hemosiderin storage

Iron Indices
- bone marrow aspirate: gold standard test for iron stores (rarely done)
- serum ferritin: most important blood test for iron stores
  - decreased in iron deficiency anemia
  - elevated in infection, inflammation, malignancy, liver disease, hyperthyroidism, and iron overload
- serum iron: measure of all non-heme iron present in blood
  - varies significantly daily
  - virtually all serum iron is bound to transferrin, only a trace is free or complexed in ferritin
- total iron binding capacity (TIBC): total amount of transferrin present in blood
  - normally, one third of TIBC is saturated with iron
  - high specificity for decreased iron, low sensitivity
- saturation
  - serum Fe divided by TIBC, expressed as a proportion or a percentage
  - low in iron deficiency anemia
- soluble transferrin receptor (sTfR)
  - reflects the availability of iron at the tissue level
  - the transferrin receptor is expressed on the surface of erythroblasts and is responsible for iron uptake – some is cleaved off and is present in circulation as sTfR

Figure 5. Iron metabolism
in iron deficient states more transferrin receptor is expressed on erythroblasts leading to an increase in sTfR
- low in reduced erythropoiesis and iron overload
- useful in determining iron deficiency in the setting of chronic inflammatory disorders (see Iron Deficiency Anemia)

## Iron Deficiency Anemia

- see Pediatrics, P47
- most common cause of anemia in North America

### Etiology
- increased demand
  - increased physiological need for iron in the body (e.g. pregnancy)
- decreased supply: dietary deficiencies (rarely the only etiology)
  - cow's milk (infant diet)
  - "tea and toast" diet (elderly)
  - absorption imbalances
  - post-gastrectomy
  - malabsorption (IBD of duodenum, celiac disease, autoimmune atrophic gastritis)
- increased losses
  - hemorrhage
    - obvious causes: menorrhagia, abnormal uterine bleeding, frank GI bleed
    - occult: peptic ulcer disease, GI cancer
  - hemolysis
    - intravascular (e.g. PNH, cardiac valve RBC fragmentation)
    - extravascular (e.g. immune hemolytic anemias)

### Clinical Features
- iron deficiency may cause fatigue before clinical anemia develops
- signs/symptoms of anemia: see Anemia, H6
- brittle hair, nail changes (brittle, koilonychia)
- Plummer-Vinson syndrome: dysphagia (esophageal webs), glossitis, angular stomatitis (inflammation and fissuring at the corners of the mouth)
- pica (appetite for non-food substances e.g. ice, paint, dirt)

### Investigations
- iron indices, including soluble transferrin receptor
  - low ferritin (<45 µg/L) is diagnostic of iron deficiency
  - ferritin is an acute phase reactant and is elevated in the setting of inflammatory conditions and liver disease; serum ferritin <100 µg/L in these settings is suggestive of iron deficiency, necessitating further workup
- peripheral blood film
  - hypochromic microcytosis: RBCs have low Hb levels due to lack of iron
  - pencil forms, anisocytosis
  - target cells (thin)
- bone marrow (gold standard but rarely done)
  - iron stain (Prussian blue) shows decreased iron in macrophages and in erythroid precursors (sideroblasts)
  - intermediate and late erythroblasts show micronormoblastic maturation

Iron deficiency anemia is a common presentation of chronic lower GI bleeds (right-sided colorectal cancer, angiodysplasia, etc.)
In males and in post-menopausal women, a GI workup is always warranted

Plummer-Vinson Syndrome Triad
- Dysphagia (esophageal)
- Glossitis
- Iron deficiency anemia

![Figure 6. Approach to interpreting iron indices](image-url)
**Treatment**
- treat underlying cause
- supplementation
  - oral (tablets, syrup)
    - ferrous sulphate 325 mg tid, ferrous gluconate 300 mg tid, or ferrous fumarate 300 mg tid
    - supplement until anemia corrects, then continue for 3+ mo until serum ferritin returns to normal
    - oral iron should be taken with citrus juice (vitamin C) to enhance absorption
  - IV (iron sucrose or dextran) can be used if patient cannot tolerate or absorb oral iron
- monitoring response
  - reticulocyte count will begin to increase after one wk
  - Hb normalizes by 10 g/L per wk (if no blood loss)
  - iron supplementation required for 4-6 mo to replenish stores

**Anemia of Chronic Disease**

**Etiology**
- infection, malignancy, inflammatory and rheumatologic disease, chronic renal and liver disease, endocrine disorders (e.g. DM, hypothyroidism, hypogonadism, hypopituitarism)

**Pathophysiology**
- an anemia of underproduction due to impaired iron utilization (hepcidin is a key regulatory peptide)
  - hepatic hepcidin production is increased in inflammatory processes, trapping iron in enterocytes and macrophages (via ferroportin inhibition) (see Figure 5)
  - reduced plasma iron levels make iron relatively unavailable for new hemoglobin synthesis
  - marrow unresponsive to normal or slightly elevated EPO
- mild hemolytic component is often present
- RBC survival is modestly decreased

**Investigations**
- diagnosis of exclusion
- associated with elevation in acute phase reactants (ESR, CRP, fibrinogen, platelets)
- peripheral blood
  - mild: usually normocytic and normochromic
  - moderate: may be microcytic and normochromic
  - severe: may be microcytic and hypochromic
  - absolute reticulocyte count is frequently low, reflecting overall decrease in RBC production
  - “classic” serum iron indices
    - serum iron and TIBC low, % saturation normal
    - serum ferritin is normal or increased
  - bone marrow
    - normal or increased iron stores
    - decreased or absent staining for iron in erythroid precursors

**Treatment**
- treat underlying disease
- only treat anemia in patients who can benefit from a higher hemoglobin
- IV iron if no benefit form PO iron (overcomes sequestration in enterocytes)
- erythropoietin indicated in chronic renal failure; not to be used if patient has concomitant curative solid tumour malignancy; ensure Hb target <110 g/L

**Sideroblastic Anemia**
- uncommon compared to iron deficiency anemia or anemia of chronic disease

**Sideroblasts**
- erythrocytes with iron-containing (basophilic) granules in the cytoplasm
  - “normal”: granules are small, randomly spread in the cytoplasm
  - found in healthy individuals
  - “ring”: iron deposits in mitochondria, forming a ring around the nucleus
  - abnormal, large granules
  - the hallmark of sideroblastic anemia

**Etiology**
- due to defects in heme biosynthesis in erythroid precursors
- hereditary (rare): X-linked; median survival 10 yr
- idiopathic (acquired)
  - refractory anemia with ringed sideroblasts: a subtype of MDS (see *Myelodysplastic Syndromes*, H39)
  - may be a preleukemic phenomenon (10% transform to AML)
  - reversible
    - drugs (isoniazid, chloramphenicol), alcohol, lead, copper deficiency, zinc toxicity, hypothyroidism

Iron-deficiency anemia commonly co-exists with anemia of chronic disease; suggested by:
- Serum ferritin <100 µg/L in setting of a chronic inflammatory disease
- Elevation of soluble transferrin receptor
- Absence of stainable iron on bone marrow aspiration/biopsy
- Response to a therapeutic trial of oral iron
Clinical Features
- anemia symptoms (see Anemia, H6)
- hepatosplenomegaly, hemochromatosis

Investigations
- serum iron indices
  - increased serum Fe^{2+}, normal TIBC, increased ferritin, increased sTfR
- blood film/bone marrow biopsy
  - ringed sideroblasts (diagnostic hallmark)
  - RBCs are hypochromic; can be micro-, normo-, or macrocytic
  - anisocytosis, poikilocytosis, basophilic stippling

Treatment
- depends on etiology
  - X-linked: high dose pyridoxine (vitamin B6) in some cases
  - acquired: EPO and G-CSF
  - reversible: remove precipitating cause
- supportive transfusions for severe anemia

Lead Poisoning

Definition/Etiology
- blood lead levels greater than 80 µg/dL, possible symptomatology at 50 µg/dL
- identify source: consider occupational history, exposures history

Clinical Features
- abdominal pain, constipation, irritability, difficulty concentrating

Treatment
- chelation therapy: dimercaprol and EDTA are first line agents

Thalassemia
- see Hemolytic Anemia – Thalassemia, H19

Normocytic Anemia
- MCV 80-100 fL
- see Figure 2, Approach to Anemia, H6

Aplastic Anemia

Definition
- destruction of hematopoietic cells of the bone marrow leading to pancytopenia and hypocellular bone marrow

Epidemiology
- occurs at any age
- slightly more common in males

Etiology

<table>
<thead>
<tr>
<th>Table 11. Etiology of Aplastic Anemia</th>

</tbody>
</table>

Clinical Features
- can present acutely or insidiously
- symptoms of anemia (see Anemia, H6), thrombocytopenia (see Thrombocytopenia, H7), and/or infection
- ± splenomegaly and lymphadenopathy (depending on the cause)
Investigations

- exclude other causes of pancytopenia (see Figure 4), including PNH (overlap syndrome)
- CBC
  - anemia or neutropenia or thrombocytopenia (any combination) ± pancytopenia
  - decreased reticulocytes (<1% of the total RBC count)
- blood film
  - decreased number of normal RBCs
- bone marrow
  - aplasia or hypoplasia of marrow cells with fat replacement
  - decreased cellularity

Treatment

- remove offending agents
- supportive care (red cell and platelet transfusions, antibiotics)
  - judicious use so as to not increase the risk of immune sensitization to blood products
- immunosuppression (for idiopathic aplastic anemia)
  - anti-thymocyte globulin: 50-60% of patients respond
  - cyclosporine
- allogenic bone marrow transplant
- growth factors: e.g. Eltrombopag (TPO receptor agonist)

Hemolytic Anemia

- uncommon cause for anemia (<5% of cases) with many etiologies (>200)

Classification

- hereditary
  - abnormal membrane (spherocytosis, elliptocytosis)
  - abnormal enzymes (pyruvate kinase deficiency, G6PD deficiency)
  - abnormal hemoglobin synthesis (thalassemias, hemoglobinopathies)
- acquired
  - immune
    - autoimmune: warm vs. cold autoimmune hemolytic anemias (AIHA), see Table 14 Classification of AIHA, H22
    - alloimmune: hemolytic disease of the fetus/newborn
  - non-immune
    - MAHA: thrombus in blood vessel causes RBCs to be sheared
      - associated with DIC, HUS/HTP, preeclampsia/HELLP, vasculitides, malignant hypertension
    - other causes: PNH, hypersplenism, march hemoglobinuria (exertional hemolysis), infection (e.g. malaria), snake venoms, mechanical heart valves
  - also classified as intravascular or extravascular
    - intravascular: G6PD deficiency, TTP, DIC, and PNH
    - extravascular: AIHA and membranopathies

Clinical Features Specific to HA

- jaundice
- dark urine (hemoglobinuria, bilirubin)
- cholelithiasis (pigment stones)
- potential for an aplastic crisis (i.e. BM suppression in overwhelming infection)
- iron overload with extravascular hemolysis
- iron deficiency with intravascular hemolysis

Investigations

</tbody>
</table>

Tests Specific for Extravascular Hemolysis

- Direct Coombs test (direct antiglobulin test)
  - Detects IgG or complement on the surface of RBC
  - Add anti-IgG or anti-complement Ab to patient's RBCs; positive if agglutination
  - Indications: hemolytic disease of newborn, AIHA, hemolytic transfusion reaction
- Indirect Coombs test (indirect antiglobulin test)
  - Detects antibodies in serum that can recognize antigens on RBCs
  - Mix patient's serum + donor RBCs + Coombs serum (anti-human Ig Ab); positive if agglutination
  - Indications: cross-matching donor RBCs, atypical blood group, blood group Ab in pregnant women, AIHA
Thalassemia

Definition
• defects in production of the α or β chains of hemoglobin
  ▪ resulting imbalance in globin chains leads to ineffective erythropoiesis and hemolysis in the spleen or BM
• clinical manifestations and treatment depends on specific gene and number of alleles affected
• common features:
  ▪ increasing severity with increasing number of alleles involved
  ▪ hypochromic microcytic anemia
  ▪ basophilic stippling, abnormally shaped RBCs on blood film

Pathophysiology
• defect may be in any of the Hb genes
  ▪ normally 4α genes in total; 2 on each copy of chromosome 16
  ▪ normally 2β genes in total; 1 on each copy of chromosome 11
  ▪ fetal hemoglobin, HbF (α2γ2), switches to adult forms HbA (α2β2) and HbA2 (α2δ2) at 3-6 mo of life
  ▪ HbA constitutes 97% of adult hemoglobin
  ▪ HbA2 constitutes 3% of adult hemoglobin

β-Thalassemia Minor (Thalassemia Trait)

Definition
• defect in single allele of β gene (heterozygous)
• common in people of Mediterranean and Asian descent

Clinical Features
• none; a palpable spleen is very rare

Investigations
• Hb (100-140 g/L), MCV(<70), Fe (normal), RBC count (normal)
• peripheral blood film – microcytosis basophilic stippling
• Hb electrophoresis
  ▪ specific: HbA2 increased to 3.5-5% (normal 1.5-3.5%)
  ▪ non-specific: 50% have slight increase in HbF

Treatment
• no treatment required
• genetic counselling for patient and family

β-Thalassemia Major

Definition
• defect in both alleles of β gene (homozygous, autosomal recessive)

Pathophysiology
• ineffective chain synthesis leading to ineffective erythropoiesis, hemolysis of RBCs, and increase in HbF

Clinical Features
• initial presentation at age 6-12 mo when HbA normally replaces HbF
  ▪ severe anemia, jaundice
• iron overload progressing to hemochromatosis
  ▪ secondary to repeated transfusions and ineffective erythropoiesis
  ▪ leads to iron-induced organ damage (see Gastroenterology, G33)
• stunted growth and development (hypogonadal dwarf)
• gross hepatosplenomegaly (due to extramedullary hematopoiesis)
• radiologic changes (due to expanded marrow cavity) and extramedullary hematopoietic masses (erythroid tissue tumours)
  ▪ skull x-ray has “hair-on-end” appearance
  ▪ pathologic fractures common
• evidence of increased Hb catabolism (e.g. pigmented gallstones)
• death can result from
  ▪ untreated anemia (should transfuse)
  ▪ infection (should identify and treat early)
  ▪ iron overload (common): late complication from repeated transfusions and ineffective erythropoiesis
Investigations
- CBC: Hb 40-60 g/L (4-6 g/dL)
- Hb electrophoresis
  - HbA: 0-10% (normal >95%)
  - HbA2 >2.5%
  - HbF: 90-100%

Treatment
- lifelong regular transfusions to suppress endogenous erythropoiesis
- iron chelation (e.g. deferoxamine, deferasirox, deferiprone) to prevent iron overload in organs and the formation of free radicals (which promote tissue damage and fibrosis)
- folic acid supplementation if not transfused
- allogenic bone marrow transplantation
- splenectomy (now performed less frequently)

β-Thalassemia Intermedia

Definition
- clinical diagnosis in patients whose clinical manifestations are too mild to be classified as thalassemia major, but too severe to be classified as thalassemia minor

Clinical Features
- wide variety of clinical phenotypes
- in most cases of TI, both β-globin genes affected
- three main mechanisms account for the milder phenotype compared to thalassemia major: (1) subnormal (vs. absent) beta-chain synthesis, (2) increased number of gamma chains, (3) coinheritance of alpha thalassemia (in some cases)
- complications more commonly seen in TI than thalassemia major include extramedullary hematopoiesis, leg ulcers, gallstones, thrombosis, and pulmonary hypertension

α-Thalassemia

Definition
- defect(s) in α genes
- similar geographic distribution as β-thalassemia, but higher frequency among Asians and Africans

Clinical Features
- 1 defective α gene (aa/a-): clinically silent; normal Hb, normal MCV
- 2 defective α genes (cis: aa/-/ or trans: a/-/-): decreased MCV, normal Hb
  - N.B. cis 2-gene deletion more common in Asia vs. trans 2-gene deletion more common in Africa – this leads to increased risk of fetal hydrops in offspring of Asian patients vs. African patients
- 3 defective α genes (a-/-/-): HbH (β4) disease; presents in adults, decreased MCV, decreased Hb, splenomegaly
- 4 defective α genes (--/-/-): Hb Barts (γ4) disease (hydrops fetalis); usually incompatible with life

Investigations
- peripheral blood film – screen for HbH inclusion bodies with supravital stain
- Hb electrophoresis not diagnostic for α-thalassemia
- DNA analysis using α gene probes is the only way to confirm the diagnosis
- referral to genetic counselor prior to childbearing for patients with 2-gene cis deletion (or 3-gene deletion), due to risk of fetal hydrops if partner also carries thalassemia trait

Treatment
- depends on degree of anemia
  - 1 or 2 defective α genes: no treatment required
  - HbH disease: similar to β-thalassemia intermedia
  - HbBarts: intrauterine transfusion
Sickle Cell Disease

**Definition**
- Sickling disorders arise due to a mutant β-globin chain, most commonly caused by a Glu → Val substitution at position 6 (chromosome 11) resulting in HbS variant, rather than HbA (normal adult Hb).
  - Increased incidence of HbS allele with African or Mediterranean heritage (thought to be protective against malaria).
  - Sickle cell disease occurs when an individual has two HbS genes (homozygous, HbSS) or one HbS gene + another mutant β-globin gene (compound heterozygote) - most commonly HbS-β-thal and HbSC disease.

**Pathophysiology**
- At low pO2, deoxy HbS polymerizes leading to rigid crystal-like rods that distort membranes → ‘sickles’
- The pO2 level at which sickling occurs is related to the percentage of HbS present:
  - Heterozygotes (HbAS): sickling occurs at a pO2 of 40 mmHg
  - Homozygotes (HbSS): sickling occurs at a pO2 of 80 mmHg
- Sickle cell aggravation by acidemia, increased CO2, increased 2,3-DPG, fever, and osmolality.
- Fragile sickle cells then cause injury in two main ways:
  1. Fragile sickle cells hemolyze (nitric oxide depletion).
  2. Occlusion of small vessels (hypoxia, ischemia-reperfusion injury).

**Clinical Features**
- HbAS (sickle cell trait): patient will be asymptomatic except during extreme hypoxia or infection.
- Increased risk of renal medullary carcinoma.
- SCD-SS (HbSS): chronic hemolytic anemia, jaundice in the first yr of life, retarded growth and development ± skeletal changes, splenomegaly in childhood, splenic atrophy in adulthood.
- SCD-SS often presents with acute pain episode:
  1. Aplastic crises:
     - Toxins and infections (especially parvovirus B19) transiently suppress bone marrow.
  2. Spleenic sequestration crises:
     - Usually in children; significant pooling of blood in spleen resulting in acute Hb drop and shock.
     - Uncommon in adults due to asplenia from repeated infarction.
  3. Vaso-occlusive crises (infarction):
     - May affect various organs causing ischemia-reperfusion injury (especially in back, chest, abdomen, and extremities), fever, and leukocytosis.
     - Can cause a stroke or a silent myocardial infarction.
     - Precipitated by infections, dehydration, rapid change in temperature, pregnancy, menses, and alcohol.
  4. Acute chest syndrome (see sidebar).
- SCD-SC (most common compound heterozygote):
  1. 1:833 live births in African-Americans, common in West Africa.
  2. Milder anemia than HbSS.
  3. Similar complications as HbSS, although typically milder and less frequent (exception is proliferative sickle retinopathy, glomerulonephritis, and avascular necrosis).
  4. Spleen not always atrophic in adults.

**Investigations**
- Sickle cell prep (detects sickling of RBCs under the microscope in response to O2 lowering agent): determines the presence of a HbS allele, but does not distinguish HbAS from HbSS.
- Hb electrophoresis distinguishes HbAS, HbSS, HbSC, and other variants.

**Figure 7. Pathophysiology of sickling**

**Acute Chest Syndrome**
Affects 30% of patients with sickle cell disease and may be life threatening. Presentation includes dyspnea, chest pain, fever, tachypnea, leukocytosis, and pulmonary infiltrate on CXR. Caused by vaso-occlusion, infection, or pulmonary fat embolus from infarcted marrow.

**Organs Affected by Vaso-Occlusive Crisis**

Treatment

- genetic counselling
- HbAS: no treatment required
- HbSC: treatment as per HbSS, but is dictated by symptom severity
- HbSS
  1. folic acid to prevent folate deficiency
  2. hydroxyurea to enhance production of HbF
     - mechanism of action: stops repression of Hb-γ chains and/or initiates differentiation of stem cells in which this gene is active
     - presence of HbF in the SS cells decreases polymerization and precipitation of HbS
     - N.B. hydroxyurea is cytotoxic and may cause bone marrow suppression
  3. treatment of vaso-occlusive crisis
     - oxygen
     - hydration (reduces viscosity)
     - correct acidosis
     - analgesics/opiates
     - indication for exchange transfusion: acute chest syndrome, stroke, multi-organ failure, ICU admission
     - less routinely: antimicrobials for suspected infection
  4. prevention of crises
     - establish diagnosis
     - avoid conditions that promote sickling (hypoxia, acidosis, dehydration, fever)
     - vaccination in childhood (pneumococcus, meningococcus, *H. influenza b*)
     - prophylactic penicillin (age 3 mo-5 yr)
     - good hygiene, nutrition, and social support
  5. screen for complications
     - regular blood work (CBC, reticulocytes, iron indices, BUN, LFTs, creatinine)
     - urinalysis annually (proteinuria, glomerulopathy)
     - transcranial doppler annually until 16 yr old (stroke prevention)
     - retinal examinations annually from 8 yr old (screen for retinopathy)
     - echocardiography starting at 10 yr old (screen for pulmonary hypertension)

Microangiopathic Hemolytic Anemia

**Definition**
- hemolytic anemia due to intravascular fragmentation of RBCs

**Etiology**
- see *Thrombotic Thrombocytopenic Purpura and Hemolytic Uremic Syndrome*, H30
- see *Disseminated Intravascular Coagulation*, H32
- eclampsia, HELLP syndrome, AFLP (see *Obstetrics*, OB25, OB26)
- malignant hypertension
- vasculitis
- malfunctioning heart valves
- metastatic carcinoma
- drugs (calcineurin inhibitors, quinine, simvastatin)
- infections (severe CMV or meningococcus)
- catastrophic antiphospholipid antibody syndrome

© Kristina Neuman 2010

NIH Consensus Development Conference
Statement: Hydroxyurea Treatment for Sickle Cell Disease
**Efficacy**: Strong evidence for adolescents and adults and there is emerging data supporting its use in children. In the single RCT, the Hb level was higher in hydroxyurea recipients than placebo recipients after 2 yr (difference, 6 g/L), as was HbF (absolute difference, 3.2%). The median number of painful crises was 44% lower than in the placebo arm. The 12 observational studies that enrolled adults reported a relative increase in HbF of 0-20% and a relative reduction in crisis rates by 68-84%. Hospital admissions declined by 18-32%.
**Effectiveness**: Data is limited. It seems to be highly effective but is currently underutilized.
**Short-Term Harms (within 6 mo)**: Dose-related leukopenia, thrombocytopenia, anemia, and decreased reticulocyte count. Others include decreased sperm production and dry skin.
**Long-Term Harms**: Birth defects in offspring of people receiving the drug, growth delays in children receiving the drug, and cancer in both children and adults who receive the drug.
Investigations
- blood film: evidence of hemolysis, schistocytes
- hemolytic workup
- urine: hemosiderinuria, hemoglobinuria

Hereditary Spherocytosis
- most common type of hereditary hemolytic anemia
- abnormality in RBC membrane proteins (e.g. spectrin)
- spleen makes defective RBCs more spherocytotic (and more fragile) by membrane removal; also acts as site of RBC destruction
- autosomal dominant with variable penetrance

Investigations
- blood film (shows spherocytes), osmotic fragility (increased), molecular analysis for spectrin gene

Treatment
- in severe cases, splenectomy and vaccination against pneumococcus, meningococcus, and H. influenza b (avoid in early childhood)

Hereditary Elliptocytosis
Definition/Etiology
- abnormality in spectrin interaction with other membrane proteins
- autosomal dominant
- 25-75% elliptocytes
- hemolysis is usually mild

Treatment
- immunizations; splenectomy for severe hemolysis

Glucose-6-Phosphate Dehydrogenase Deficiency
Definition
- deficiency in glucose-6-phosphate dehydrogenase (G6PD), corresponding to a lack of reduced glutathione (GSH) and leading to RBC sensitivity due to oxidative stress

Pathophysiology
- X-linked recessive, prevalent in individuals of African, Asian, and Mediterranean descent

Clinical Features
- frequently presents as episodic hemolysis precipitated by:
  - oxidative stress
  - drugs (e.g. sulfonamide, antimalarials, nitrofurantoin)
  - infection
  - food (fava beans)
- in neonates: can present as prolonged, pathologic neonatal jaundice

Investigations
- neonatal screening
- G6PD assay (may not be useful if result is normal)
  - should not be done in acute crisis when reticulocyte count is high (reticulocytes have high G6PD levels)
- blood film
  - Heinz bodies (granules in RBCs due to oxidized Hb); passage through spleen results in the generation of bite cells
  - may have features of intravascular hemolysis (e.g. RBC fragments)

Treatment
- folic acid
- stop offending drugs and avoid triggers
- transfusion in severe cases
Macrocytic Anemia

Vitamin B₁₂ Deficiency

B₁₂ (cobalamin) see Gastroenterology, G17 and Family Medicine – Nutrition, FM5

- binds to intrinsic factor (IF) secreted by gastric parietal cells
- absorbed in terminal ileum
- total body stores sufficient for 3-4 yr

Etiology

Table 16. Etiology of Vitamin B₁₂ Deficiency

<td>Drugs</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Neomycin, biguanides, PPI, N₂O anesthesia</td>
<td>Neomycin, biguanides, PPI, N₂O anesthesia</td>
</tr>
</tbody>
</table>

Pathophysiology of Pernicious Anemia

- auto-antibodies produced against gastric parietal cells leading to achlorhydria and lack of intrinsic factor secretion
- intrinsic factor is required to stabilize B₁₂ as it passes through the bowel
- decreased intrinsic factor leads to decreased ileal absorption of B₁₂
- may be associated with other autoimmune disorders (polyglandular endocrine insufficiency)
- F:M = 1.6:1; often >60 yr old

Clinical Features

- neurological
  - cerebral (common, reversible with B₁₂ therapy)
  - confusion, delirium, dementia
  - cranial nerves (rare)
  - optic atrophy
  - cord (irreversible damage)
  - subacute combined degeneration
    - posterior columns: decreased vibration sense, proprioception, and 2-point discrimination
    - pyramidal tracts: spastic weakness, hyperactive reflexes
  - peripheral neuropathy (variable reversibility)
  - usually symmetrical, affecting lower limbs more than upper limbs

Investigations

- CBC, reticulocyte count
  - anemia often severe ± neutropenia ± thrombocytopenia
  - MCV >110 fL
  - low reticulocyte count relative to the degree of anemia (<2%)
- serum B₁₂ and RBC folate
  - caution: low serum B₁₂ leads to low RBC folate because of failure of folate polyglutamate synthesis in the absence of B₁₂
  - alternatively, can measure elevated urine metabolites (methylmalonate, homocysteine)
- blood film
  - oval macrocytes, hypersegmented neutrophils
  - oral Vitamin B₁₂ vs. Intramuscular Vitamin B₁₂ for Vitamin B₁₂ Deficiency

Cochrane DB Syst Rev 2005;3:CD004655

Study: Systematic review. 2 RCTs met inclusion criteria; total 108 patients with follow-up from 90 d-4 mo.

Intervention: One study evaluated 1,000 µg of oral B₁₂ compared to 1,000 µg IM B₁₂ on the same dosing schedule. The other compared 2,000 µg daily oral B₁₂ to 1,000 µg IM B₁₂ on a less frequent dosing schedule. Neurological and hematological end points were evaluated.

Results: Meta-analysis was not attempted due to study heterogeneity. Both studies reported improvements in hematological and neurological end-points in both oral and IM groups. No significant difference was observed between groups in either study.

Conclusions: Limited data suggests high dose oral vitamin B₁₂ (1,000-2,000 µg) is equivalent to IM vitamin B₁₂ on the same or less frequent dosing schedule. This data is severely limited by small sample sizes and short follow-up periods. Insufficient numbers of patients with malabsorption conditions were included to generalize these results to the entire primary care population.
• bone marrow
  - hypercellularity
  - nuclear-cytoplasmic asynchrony in RBC precursors (less mature nuclei than expected from the development of the cytoplasm)
• bilirubin and LDH
  - elevated unconjugated bilirubin and LDH due to breakdown of cells in BM
• Schilling test to distinguish pernicious anemia from other causes
  - anti-intrinsic factor antibody, anti-parietal cell antibody

**Treatment**
• vitamin B₁₂ 1,000 µg IM monthly for life or 1,000-1,200 µg PO daily if intestinal absorption intact
• less frequent, higher doses may be as effective (e.g. 1,000 µg IM q3mo)
• watch for hypokalemia and rebound thrombocytosis when treating severe megaloblastic anemia

### Folate Deficiency

- uncommon in developed countries due to extensive dietary supplementation (enriched in flour)
- folate stores are depleted in 3-6 mo
- folate commonly found in green, leafy vegetables and fortified cereals

**Etiology**

**Table 17. Etiology of Folate Deficiency**

<table>
<thead>
<tr>
<th>Diet/Deficiency</th>
<th>Malabsorption</th>
<th>Drugs</th>
<th>Increased Demand</th>
</tr>
</thead>
<tbody>

<td>Infiltrative bowel disease Short bowel syndrome</td>
<td>Anticonvulsants (phenytoin) Alcohol Oral contraceptive</td>
<td>Hemolysis Prematurity Exfoliative dermatitis/psoriasis Hemodialysis</td>
</tr>
</tbody>
</table>

**Clinical Features**
- mild jaundice due to hemolysis of RBCs secondary to ineffective hemoglobin synthesis
- glossitis and angular stomatitis
- melanin pigmentation (rare)
- purpura secondary to thrombocytopenia (rare)
- unlike B₁₂ deficiency, folate deficiency has no neurologic manifestations

**Investigations**
- similar to B₁₂ deficiency (CBC, reticulocytes, blood film, RBC folate, serum B₁₂)
- if decreased RBC folate, rule out B₁₂ deficiency as cause

**Management**
- folic acid 1-5 mg PO OD x 1-4 mo; then 1 mg PO OD maintenance if cause is not reversible

### Hemostasis

**Three Phases of Hemostasis**

1. **Primary Hemostasis**
   - goal is rapid cessation of bleeding; main effect is on mucocutaneous bleeding
   - vessel injury results in collagen/subendothelial matrix exposure and release of vasoconstrictors
   - blood flow is impeded and platelets come into contact with damaged vessel wall (Figure 11a)
     - adhesion: platelets adhere to subendothelium via von Willebrand factor (vWF)
     - activation: platelets are activated resulting in change of shape and release of ADP and thromboxane A₂
     - aggregation: these factors further recruit and aggregate more platelets resulting in formation of localized hemostatic plug

2. **Secondary Hemostasis**
   - platelet plug is reinforced by production of fibrin clot (Figure 11b)
   - extrinsic pathway: initiation of coagulation *in vivo*
   - intrinsic pathway: amplification once coagulation has started

3. **Fibrin Stabilization and Fibrinolysis (resolution)**
   - conversion from soluble to insoluble clot
   - once healing initiated, clot dissolution (anticoagulant pathway)

<td>Uncommon</td>
</tr>
</tbody>
</table>

ACUTE (CHILD-TYPE) ITP
- see Pediatrics, P49

CHRONIC (ADULT-TYPE) ITP
- most common cause of isolated thrombocytopenia
- diagnosis of exclusion (i.e. isolated thrombocytopenia [platelets <100,000/mm³] and the absence of any obvious initiating and/or underlying cause)
**Pathophysiology**
- an acquired immune-mediated disorder
  - anti-platelet antibodies bind to platelet surface \(\rightarrow\) increased splenic destruction and clearance
  - impaired platelet production
  - helper T-cell and cytotoxic T-cell activation also implicated in platelet destruction

**Clinical Presentation**
- can present asymptomatic, with minimal bruising, or serious bleed (GI bleed, skin and mucosal hemorrhage or intracranial hemorrhage), lethargy, fatigue

**Investigations**
- CBC and reticulocyte count: thrombocytopenia (request retic count if not an isolated thrombocytopenia)
- PT and aPTT: normal
- peripheral blood film: decreased platelets, giant platelets (rule out platelet clumping)
- HIV, HCV serology (if risk factors are present)
- vitamin B12, ANA, C3, C4, depending on clinical symptoms
- bone marrow aspirate and biopsy: increased number of megakaryocytes
- recommended in patients >60 yr of age, pre-splenectomy or have failed multiple lines of ITP treatment, those with systemic symptoms, an abnormal blood film, and/or abnormal signs to rule out other causes of thrombocytopenia (e.g. myelodysplasia)

**Treatment**
- rarely indicated if platelet <30 x 10^9/L unless active bleeding, trauma, or surgery
- emergency treatment (active bleeding [CNS, GI, or GU] or in need of emergency surgery)
  - general measures: stop drugs reducing platelet function, control blood pressure, minimize trauma
  - corticosteroids: prednisone (1 mg/kg) or methylprednisolone (1 g/d x 3 d) or dexamethasone (40 mg PO x 4 d)
  - antifibrinolytic: tranexamic acid (1 g PO tid or 1 g IV q6h) if refractory bleeding
  - IVlg 1 g/kg/d x 2 doses, or 2 g/kg over 5 d
  - platelet transfusion: for life-threatening bleeding
  - emergency splenectomy: may be considered, vaccinations prior (pneumococcus, meningococcus, H. influenza b) management of intracranial bleeding: IV steroids, IVlg, platelets, emergency splenectomy, and then craniotomy; maintain Plt >100 for at least 7 wk post intracranial hemorrhage
- non-urgent treatment (platelet count <20-30 x 10^9/L and no bleeding OR platelet count <50 x 10^9 and significant bleeding)
  - platelet transfusion does not work
  - 1st line
    - corticosteroids (dexamethasone 40 mg/d x 4 wk or prednisone 1 mg/kg/d)
    - IVlg
    - anti-D: appropriate for Rh+ non-splenectomized patients, but can cause hemolysis (avoid if low Hb at baseline or if DAT is positive)
  - 2nd line
    - splenectomy (need vaccinations prior to splenectomy: pneumococcus, meningococcus, H. influenza b)
    - immunosuppressants (azathioprine, cyclophosphamide)
    - rituximab
    - danazol, vincristine
    - thrombopoietin (TPO) receptor agonists (romiplostim, eltrombopag)

**Prognosis**
- ~20% will not attain a hemostatic platelet count after first and second line therapy
- fluctuating course
- overall relatively benign, mortality 1-2%
- major concern is cerebral hemorrhage at Plt <5 x 10^9/L, although very rare

---

**Heparin-Induced Thrombocytopenia**
- heparin-induced thrombocytopenia (previously known as HIT type II): immune-mediated reaction following treatment with heparin leading to coagulation activation
- heparin-associated thrombocytopenia (previously known at HIT type I): transient thrombocytopenia following administration of heparin

**Mechanisms for HIV-associated Thrombocytopenia**
- Direct effect of HIV on marrow
- Immune-mediated platelet destruction
- Some anti-retrovirals reduce platelet production

**Should Rituximab Be Used Before or After Splenectomy in Patients with Immune Thrombocytopenic Purpura (ITP)?**
- Curr Opin Hematol 2007;14:642-646

**Purpose:** To determine whether the optimal timing for rituximab is before splenectomy, or after failure of splenectomy.

**Results:** Rituximab produces an initial response in approximately 60% of cases, with no significant difference between splenectomized and non-splenectomized patients. Long-term complete responses are observed in 15-20% of cases. Adverse events related to the drug were usually mild or moderate, with a low incidence of infections. Long-term safety data, however, are still lacking. Deaths have been reported for 2.9% of ITP cases treated with rituximab, but they could not be attributed to the study drug.

**Conclusion:** Both the response rate and the response duration appear lower following rituximab than following splenectomy. Although the side effects may be fewer, there is insufficient evidence to support the replacement of splenectomy with rituximab as a second-line treatment of chronic ITP outside a clinical trial. At the present time, the use of immunotherapy before splenectomy can be recommended only in patients at high risk for splenectomy and those not willing to undergo surgery.
### Table 22. Heparin-Induced Thrombocytopenia (HIT)

<table>
<thead>
<tr>
<th>Pathophysiology</th>
<th>Immune mediated Ab recognizes a complex of heparin and platelet factor 4 (PF4) leading to platelet activation via platelet Fc receptor and activation of coagulation system</th>
</tr>
</thead>
<tbody>
<tr>
<td>Diagnosis</td>
<td>50% reduction in platelets while on heparin within 5-15 wk of initiation</td>
</tr>
<tr>
<td>Onset of Decreased Platelets</td>
<td>5-15 wk (if previously exposed to heparin, HIT can develop in hours)</td>
</tr>
<tr>
<td>Risk of Thrombosis</td>
<td>~30% (25% of events are arterial)</td>
</tr>
<tr>
<td>Clinical Features</td>
<td>Bleeding complications uncommon Venous thrombosis: DVT, PE, limb gangrene, cerebral sinus thrombosis Arterial thrombosis: MI, stroke, acute limb ischemia, organ infarct (mesentery, kidney) Heparin-induced skin necrosis (with LMWH) Acute platelet activation syndromes: acute inflammatory reactions (e.g. fever/chills, flushing, etc.) Transient global amnesia (rare)</td>
</tr>
<tr>
<td>Specific Tests</td>
<td>Pre-test clinical scoring models can help rule-out HIT: 4-Ts (see Table 23) and the HIT Expert Probability (HEP) score 14C serotonin release assay (uses donor platelets with 14C serotonin and heparin with patient’s plasma) ELISA for HIT-Ig (more sensitive, less specific than serotonin assay) Ultrasound of lower limb veins for DVT</td>
</tr>
<tr>
<td>Management</td>
<td>Clinical suspicion of HIT should prompt discontinuation of heparin and LMWH (specific tests take several days) Initiate anticoagulation with a non-heparin anticoagulant: e.g. argatroban, danaparoid, fondaparinux, bivalirudin unless there is a strong contraindication (duration of treatment at least 2-3 mo if no thrombotic event, and at least 3-6 mo if thrombotic event has occurred) Warfarin should only be restarted when platelet count &gt;100 x 10^9/L Allergy band and alert in patient records</td>
</tr>
</tbody>
</table>

LMWH is also associated with HIT, but the risk is less than unfractionated heparin (2.6% in UFP vs. 0.2% in LMWH)

### Table 23. The 4-T Pre-Test Clinical Scoring Model for HIT

von Willebrand Disease

Pathophysiology
- most common inheritable coagulation abnormality
- heterogeneous group of defects, usually mild in severity
- usually autosomal dominant (type 3 is autosomal recessive)
- qualitative or quantitative abnormality of vWF
  - vWF needed for platelet adhesion and acts as carrier for Factor VIII; abnormality of vWF can affect both primary and secondary hemostasis
  - vWF exists as a series of multimers ranging in size
    - largest multimers are most active in mediation of platelet adhesion, both large and small multimers complex with Factor VIII

Classification
- type 1: mild quantitative defect (decreased amount of vWF and proportional decrease in vWF activity) – 75% of cases
- type 2: qualitative defect (vWF activity disproportionally lower than quantity) – 20-25% of cases
- type 3: severe total quantitative defect (no vWF produced) – rare

Clinical Features
- mild
  - asymptomatic
  - mucosal and cutaneous bleeding, easy bruising, epistaxis, menorrhagia
- moderate to severe
  - as above but more severe, occasionally soft-tissue hematomas, petechiae (rare), GI bleeding, hemarthroses

Investigations

Pathophysiology of TTP
- vWF secreted by endothelial cells is a very large polymer rapidly cleaved by the ADAMTS-13 protease
- Congenital TTP is due to a deficiency in ADAMTS-13
- Antibodies against ADAMTS-13 are present in acquired TTP

Differential Diagnosis of TTP
- Sepsis
- DIC
- HELLP
- Antiphospholipid Ab syndrome
- Evans syndrome (AIHA + ITP)

Consider vWD in all women with menorrhagia

vWD is the most common inheritable coagulation abnormality
Treatment
- desmopressin (DDAVP) is treatment of choice for type 1 vWD
  - causes release of vWF and Factor VIII from endothelial cells
  - variable efficacy depending on disease type; tachyphylaxis occurs
  - need good response before using with further bleeding
  - caution in children due to hyponatremia
- tranexamic acid (Cyklokapron, antifibrinolytic) to stabilize clot formation
- high-purity Factor VIII concentrate containing vWF (Hemate P) in select cases
  - frozen plasma (FP) is not useful
  - need to monitor vWF and factor VIII levels (very high factor VIII level can cause thrombosis)
- conjugated estrogens (increase vWF levels)

Prognosis
- may fluctuate, often improves during pregnancy, inflammation, and with age

Disorders of Secondary Hemostasis

Definition
- inability to form an adequate fibrin clot
  - disorders of clotting factors or co-factors
  - disorders of proteins associated with fibrinolysis
- characterized by delayed bleeding, deep muscular bleeding, spontaneous joint bleeding

Table 26. Classification of Secondary Hemostasis Disorders

</table>

Hemophilia A (Factor VIII Deficiency)

Pathophysiology
- X-linked recessive, 1/5,000 males
- mild (>5% of normal factor level), moderate (1-5%), severe (<1%)

Clinical Features
- see Table 19 – Signs and Symptoms of Disorders of Hemostasis, H26
- older patients may also have HIV or HCV from contaminated blood products

Investigations
- prolonged aPTT, normal INR (PT)
- decreased Factor VIII (<40% of normal)
- vWF usually normal or increased

Treatment
- desmopressin (DDAVP) in mild hemophilia A
- recombinant Factor VIII concentrate for:
  - prophylaxis (2-3x/wk at home)
  - minor but not trivial bleeding (e.g. hemarthroses)
  - major potentially life-threatening bleeding (e.g. multiple trauma)
- anti-fibrinolytic agents (e.g. tranexamic acid)

Hemophilia B (Factor IX Deficiency)

- also known as Christmas disease
- X-linked recessive, 1/30,000 males
- clinical and laboratory features identical to hemophilia A (except decreased Factor IX)
- treatment: recombinant Factor IX concentrate, anti-fibrinolytic agents

Factor XI Deficiency

- also known as Rosenthal syndrome
- autosomal recessive; more common in Ashkenazi Jewish population
- usually mild, often diagnosed in adulthood
- Factor XI level does not correlate with bleeding risk
- treatment: frozen plasma, Factor XI concentrate
Liver Disease

- see Gastroenterology, G28

Pathophysiology

- deficient synthesis of all factors except VIII (also made in endothelium and in acute phase response)
- aberrant synthesis of fibrinogen
- deficient clearance of hemostatic ‘debris’ and fibrinolytic activators
- accelerated destruction due to dysfibrinogenemias: increased fibrinolysis, DIC
- miscellaneous: inhibition of secondary hemostasis by FDPs

Investigations

- peripheral blood film: target cells
- primary hemostasis affected
  - thrombocytopenia due to hypersplenism, folate deficiency, alcohol intoxication, DIC, decreased production of thrombopoietin
  - platelet dysfunction (e.g. alcohol abuse)
- secondary hemostasis affected
  - elevated INR (PT), aPTT and TT, low fibrinogen in end-stage liver disease

Treatment

- supportive, treat liver disease, blood products if active bleeding (frozen plasma, platelets, cryoprecipitate)

Vitamin K Deficiency

Etiology

- drugs
  - oral anticoagulants which inhibit Factors II, VII, IX, X, proteins C and S
  - antibiotics eradicating gut flora, altering vitamin K uptake
- poor diet (especially in alcoholics)
- biliary obstruction
- chronic liver disease (decreased stores)
- malabsorption (e.g. celiac disease)
- hemorrhagic disease of newborn, see Pediatrics, P68

Investigations

- INR (PT) is elevated out of proportion to elevation of the aPTT
- decreased Factors II, VII, IX, X (vitamin K-dependent)

Treatment

- hold anticoagulant
- vitamin K 1 mg PO for INR between 4.5-10 and no active bleeding (excludes hemorrhagic disease of the newborn)
- if bleeding, give vitamin K 10 mg IV
- if life-threatening bleeding and vitamin K antagonist used, give frozen plasma (FP) or prothrombin complex concentrate (PCC)
- PCCs are contraindicated if there is a previous history of HIT
- use FFP if PCC is contraindicated or unavailable
- note: excessive vitamin K will delay therapeutic warfarin anticoagulation once re-started

Disseminated Intravascular Coagulation

Definition

- uncontrolled release of plasmin and thrombin leading to intravascular coagulation and depletion of platelets, coagulation factors and fibrinogen
- risk of life-threatening hemorrhage

Etiology

- occurs as a complication of many other conditions
- widespread endothelial damage ± extensive inflammatory cytokine release

Investigations
- primary hemostasis: decreased platelets
- secondary hemostasis: prolonged INR (PT), aPTT, TT, decreased fibrinogen and other factors
- fibrinolysis: increased FDPs or D-dimers, short euglobulin lysis time (i.e. accelerated fibrinolysis)
- extent of fibrin deposition: urine output, urea, RBC fragmentation

Treatment
- recognize early and treat underlying disorder
- individualized critical care support
- in hemorrhage: replacement of hemostatic elements with platelet transfusion, frozen plasma, cryoprecipitate
  - maintain platelets >50 x10^9, hemoglobin >80 g/L, calcium between 2.2-2.7 mmol/L, and avoid hypothermia
  - 4-5 units of FFP if INR >1.5 or aPTT >38
  - 10 units of cryoprecipitate if fibrinogen <1 g/L
  - 1 adult dose of buffy-coat platelets if <10 x10^9 (<20 if febrile, <50 before invasive procedure)
- in thrombotic phase: UFH or LMWH in critically ill, non-bleeding patients

Hypercoagulable Disorders

Hypercoagulability Workup – Venous Thrombosis
- work up for malignancy is suggested in the event of abnormal blood work, constitutional symptoms or physical exam suggestive of cancer
- all patients should have age-appropriate cancer screening if not already done
- work up for hypercoagulable state is controversial and should only be done if it will alter treatment decisions
- recommendations for a hypercoagulable work up include:
  - heparin resistance (ATIII deficiency)
  - warfarin-induced skin necrosis or neonatal purpura fulminans (protein C or S deficiency)
  - consider for patients with a family history of VTE who are considering OCP use
  - consider for patients who present with thrombosis at an unusual venous site
- Arterial thrombotic events have only been proven to be associated with APLA, HIT, JAK2 MPNs, and PNH

American Society of Hematology

Choosing Wisely Recommendations
1. Do not test for thrombophilia in adult patients with venous thromboembolism occurring in the setting of major transient risk factors (surgery, trauma, or prolonged immobility)
2. Do not use inferior vena cava filters routinely in patients with acute venous thromboembolism
CAUSES OF HYPERCOAGULABILITY LEADING TO VENOUS THROMBOEMBOLISM

Activated Protein C Resistance (Factor V Leiden)
- most common cause of hereditary thrombophilia
- 3-7% of European Caucasian population are heterozygotes
- point mutation in the Factor V gene (R506Q) results in resistance to inactivation of Factor Va by activated protein C

Prothrombin Gene Mutation (PT) G20210A
- 1-3% of European Caucasian population are heterozygotes
- G to A transposition at nucleotide position 20210 of the prothrombin gene promoter region results in increased levels of prothrombin, thus increased thrombin generation

Protein C and Protein S Deficiency
- protein C inactivates Factor Va and VIIIa using protein S as a cofactor
- protein C deficiency
  - homozygous or compound heterozygous: neonatal purpura fulminans
  - heterozygous
    - type I: decreased protein C levels
    - type II: decreased protein C activity
  - acquired: liver disease, sepsis, DIC, warfarin, certain chemotherapeutic agents
- 1/3 of patients with warfarin necrosis have underlying protein C deficiency
- protein S deficiency
  - type I: decreased free and total protein S levels
  - type II: decreased protein S activity
  - type III: decreased free protein S levels
  - acquired: liver disease, DIC, pregnancy, nephrotic syndrome, inflammatory conditions, warfarin

Antithrombin Deficiency
- antithrombin slowly inactivates thrombin in the absence of heparin, rapidly inactivates thrombin in the presence of heparin
- autosomal dominant inheritance, urinary losses in nephrotic syndrome, or reduced synthesis in liver disease
- type I: decreased AT levels
- type II: decreased AT activity
- diagnosis must be made outside window of acute thrombosis and anticoagulation treatment (acute thrombosis, heparin, systemic disease all decrease antithrombin levels)
- deficiency may result in resistance to unfractionated heparin (LMWH may be considered, with monitoring of anti-Xa levels)

Elevated Factor VIII Levels
- an independent marker of increased incident and recurrent thrombotic risk, but levels can also be increased in numerous states as an acute phase reactant, therefore its clinical use is controversial
- genetic basis for increased levels poorly understood

Disorders of Fibrinolysis
- includes congenital plasminogen deficiency, tissue plasminogen activator deficiency, although association with VTE risk is not clear

Antiphospholipid Antibody Syndrome (APS)
- definition: ≥1 clinical and ≥1 laboratory criteria
- clinical: thrombosis, recurrent (>3) early pregnancy losses <10 weeks, one late fetal loss ≥10 weeks (morphologically normal), or premature birth before 34 wk due to (pre)eclampsia or placental insufficiency
- note: most of these tests do not change management, and a negative test does not rule out a hypercoagulable state
- thus more focus on the reversible/treatable causes (APLA, cancer, etc.)
Venous Thromboembolism

**Definition**
- thrombus formation and subsequent inflammatory response in a superficial or deep vein
- superficial thrombophlebitis, deep vein thrombosis (DVT), and pulmonary embolism (PE)
- thrombi propagate in the direction of blood flow (commonly originating in calf veins)
- more common in lower extremity than upper extremity
- incidence ~1% if age >60 yr
- most important sequelae are pulmonary embolism (~50% chance with proximal DVT) and chronic venous insufficiency

**Etiology (Virchow’s Triad)**
- endothelial damage
  - exposes endothelium to prompt hemostasis
  - leads to decreased inhibition of coagulation and local fibrinolysis
- venous stasis
  - immobilization (post-MI, CHF, stroke, post-operative) inhibits clearance and dilution of coagulation factors
- hypercoagulability
  - inherited (see *Hypercoagulable Disorders*, H33)
  - acquired
    - age (risk increases with age)
    - surgery (especially orthopedic, thoracic, GI, and GU)
    - trauma (especially fractures of spine, pelvis, femur or tibia, spinal cord injury)
    - neoplasms (especially lung, pancreas, colon, rectum, kidney, and prostate)
    - blood dyscrasias (myeloproliferative neoplasms, especially PV, ET), PNH, hyperviscosity (multiple myeloma, polycthemia, leukemia, sickle cell disease)
    - prolonged immobilization (CHF, stroke, MI, leg injury)
    - hormone related (pregnancy, OCP, HRT, SERMs)
    - APS
    - heart failure (risk of DVT greatest with right heart failure and peripheral edema)
  - idiopathic (10-20% are later found to have cancer)

**Clinical Features of DVT**
- absence of physical findings does not rule out disease
- unilateral leg edema, erythema, warmth, and tenderness
- palpable cord (thrombosed vein)
- phlegmasia alba dolens (white appearance) and phlegmasia cerula dolens (acute pain and edema) with massive thrombosis
- Homan’s sign (pain with foot dorsiflexion) is unreliable

**Differential Diagnosis of DVT**
- muscle strain or tear, lymphangitis or lymph obstruction, venous valvar insufficiency, ruptured popliteal cysts, cellulitis, arterial occlusive disease

**Investigations for DVT**
- D-dimer test only useful to rule out DVT if negative with low clinical suspicion of disease and no other acute medical issues
- doppler ultrasound is most useful diagnostic test for DVT
  - sensitivity and specificity for proximal DVT ~95%
  - sensitivity for calf DVT ~70%
- other non-invasive tests include MRI and impedance plethysmography
- venography is the gold standard, but is expensive, invasive, and higher risk

**Post-Thrombotic Syndrome**
- development of chronic venous stasis signs and symptoms secondary to a deep venous thrombosis
- symptoms: pain, venous dilatation, edema, pigmentation, skin changes, venous ulcers
- clinical severity can be estimated based on the Villalta score
- large impact on quality of life following a DVT treatment: extremity elevation, exercise, continuous compression stockings, intermittent pneumatic compression therapy, skin/ulcer care
- for Clinical Features and Treatment of PE, see *Respirology*, R18

</tr>
</tbody>
</table>
| Dalteparin was more effective than coumarin in decreasing the risk of recurrent thromboembolism without increasing the risk of bleeding. |}

**Vital Signs**

- temperature (oral or axillary)
- heart rate
- respiratory rate
- blood pressure
- oxygen saturation

**Summary**
- Thromboembolism is a common and serious complication of cancer, with a prevalence of 22% in patients with cancer and a lifetime risk of 30%.
- Early recognition and appropriate management are crucial to minimize morbidity and mortality.
- Antithrombotic therapy is the cornerstone of prophylaxis and treatment.
- Monitoring of laboratory markers, such as D-dimer, is crucial for guiding therapy.
- Regular assessment of clinical symptoms and physical examination is necessary to detect and treat post-thrombotic syndrome.

**Conclusion**
- Thromboembolism is a significant complication of cancer, and effective management requires a multidisciplinary approach.
- Early recognition and timely intervention can improve outcomes and quality of life for patients with cancer.
Approach to Treatment of Venous Thromboembolism

**Purpose**
- prevent further clot extension (3 mo duration is optimal)
- prevent acute pulmonary embolism (occurs in up to 50% of untreated patients)
- reduce the risk of recurrent thrombosis (duration depends on presence of other risk factors)
- treatment of massive iliofemoral thrombosis with acute lower limb ischemia and/or venous gangrene (phlegmasia cerulea dolens)
- limit development of late complications (e.g. postphlebitic syndrome, chronic venous insufficiency, and chronic thromboembolic pulmonary HTN)

**Initial Treatment**
- low molecular weight heparin (LMWH)
  - administered SC, at least as effective as UFH with a lower bleeding risk
  - advantages: predictable dose response and fixed dosing schedule; lab monitoring not required; <1% HIT; safe and effective outpatient therapy
  - disadvantages: only partially reversible by protamine, long-term use associated with osteoporosis
  - renalally cleared – must adjust dose in patients with renal dysfunction
- unfractionated heparin (UFH)
  - in patient with average risk of bleed; use hospital-based nomograms that use bleeding risk and patient weight to determine appropriate dose
  - advantages: rapidly reversible by protamine
  - disadvantages: must monitor aPTT or heparin levels with adjustment of dose to reach therapeutic level (~2x normal value); monitor platelet counts for development of HIT
- alternatives to LMWH and UFH
  - direct thrombin inhibitors (hirudin, lepirudin, argatroban), Factor Xa inhibitors (fondaparinux, rivaroxaban)
  - thrombolytic drugs (e.g. streptokinase, tPA) reserved for acute limb/life-threatening thrombosis, and low bleeding risk

**Long-Term Treatment**
- warfarin
  - standard treatment; should be initiated with heparin overlap: dual therapy for at least 5 d, due to initial prothrombotic state, half life of vitamin K factors and risk of warfarin-induced skin necrosis
  - discontinue heparin after INR >2.0 for 2 consecutive days
  - warfarin should be dosed to maintain INR at 2-3 except in select cases
  - monitor INR twice weekly for 1-2 wk, then weekly until INR stable, then every 2-4 wk
  - LMWH more effective than warfarin at preventing recurrence of venous thrombosis in cancer patients (see sidebar, H35)
  - duration of anticoagulant treatment (with warfarin unless otherwise noted)
    - first episode DVT with transient risk factor: 3 mo
    - first episode DVT with ongoing risk factor (e.g. immobility, antiphospholipid antibody) or >1 risk factor: consider indefinite therapy
    - cancer-associated DVT: prefer LMWH over warfarin for duration of cancer therapy or for as long as cancer remains active
    - first episode DVT with no identifiable risk factor (idiopathic) or single inherited risk factor (e.g. Factor V Leiden): 6-12 mo or indefinite therapy if bleeding risk low
    - recurrent DVT (2 or more episodes): indefinite therapy
- IVC filters
  - temporary filter indicated only if acute DVT (<4 wk) with significant contraindications to anticoagulant therapy (i.e. active bleeding) or if require interruption of anticoagulation (i.e. for surgery)
  - must be retrieved once safe to do so as filter is pro-thrombotic in the long-term (consider anticoagulation if not retrieved)
- special considerations
  - pregnancy: treat with LMWH during pregnancy, then LMWH or warfarin for 6 wk post-partum (minimum total anticoagulation time of 3-6 mo, but must include 6 ws post-partum, as this is a high risk period)
  - surgery: avoid elective surgery in the first month after a venous or arterial thromboembolic event
    - pre-operatively: IV heparin may be used up to 6 h pre-operatively
    - perioperatively: surgery safe when INR <1.5; warfarin should be discontinued for at least 5 d pre-operatively to allow INR to fall
    - post-operatively: IV heparin or LMWH can be used for anticoagulation (start 12 h after major surgery until therapeutic INR reached after restarting warfarin)
    - for patients at high risk for thromboembolism (VTE <12 wk, recurrent VTE, lupus anticoagulant, atrial fibrillation with prior stroke, mechanical heart valve), IV heparin or LMWH (bridging) should be given before and after the procedure while the INR is below 2.0

---

**Duration of Treatment with Vitamin K Antagonists in Symptomatic Venous Thromboembolism**

*Study: Meta-analysis of 8 RCTs (2,994 patients)*

*Comparing different durations of treatment with vitamin K antagonists in patients with symptomatic VTE.*

*Results: In patients treated with vitamin K antagonists for a prolonged period, the reduction in risk of recurrent VTE remained consistent regardless of the period of time since the index event (OR 0.18; 95%CI 0.13-0.25). In addition, there was no observed excess of VTE recurrences following cessation of prolonged treatment (i.e. rebound phenomenon) (OR 1.24; 95%CI 0.91-1.69). However, patients who received prolonged treatment had a persistent increase in their risk of major bleeding complications (OR 2.61; 95%CI 1.40-4.67).*

*Conclusion: Prolonged treatment with vitamin K antagonists leads to a consistent reduction in the risk of recurrent VTE for as long as therapy is continued. Therapy should be discontinued when the risk of harm from major bleeding (which remains constant over time) is of greater concern than the absolute risk of recurrent VTE (which declines over time). No specific recommendation was made regarding optimal duration of treatment.*

**Common Medications that Interact with Warfarin**

- Acetaminophen (interference with vitamin K metabolism)
- Allopurinol
- NSAIDs (GI injury)
- Fluconazole
- Metronidazole
- Sulfamethoxazole
- Tamoxifen

**Initiation of Warfarin Therapy Requires Bridging with Heparin Therapy for 4-5 Days**

- 10 mg loading dose of warfarin causes a precipitous decline in protein C levels in first 36 h resulting in a transient hypercoagulable state
- Warfarin decreases Factor VII levels in first 48 h, INR is prolonged (most sensitive to Factor VII levels), however full antithrombotic effect is not achieved until Factor IX, X, and II are sufficiently reduced (occurs after ~6 d)

**Low Risk Surgical Patients**

<40 yr, no risk factors for VTE, general anesthetic (GA) <30 min, minor elective, abdominal, or thoracic surgery

**Moderate Risk Surgical Patients**

>40 yr, >1 risk factor for VTE, GA >30 min

**High Risk Surgical Patients**

>40 yr, surgery for malignancy or lower extremity orthopedic surgery lasting >30 min, inhibitor deficiency, or other risk factor

**High Risk Medical Patients**

Heart failure, severe respiratory disease, ischemic stroke and lower limb paralysis, confined to bed and have >1 additional risk factor (e.g. active cancer, previous VTE, sepsis, acute neurologic disease, IBD)
**Prophylaxis**
- see sidebar
- consider for those with a moderate to high risk of thrombosis without contraindications
- non-pharmacological measures include: early ambulation, elastic compression stockings (TEDs), intermittent pneumatic compression (IPC)
- UFH 5,000 IU SC bid for moderate risk
- UFH 5,000 IU SC tid or LMWH as per hospital protocol (i.e. enoxaparin 40 mg SC daily) or UFH 5,000 IU SC tid for high risk

**Contraindications and Adverse Reactions of Anticoagulant Therapy**
- absolute: active bleeding, severe bleeding diathesis, or platelets <20 x 10⁹/L (<20,000/mm³), intracranial bleeding, neuro or ocular surgery within <10 d
- relative: mild-moderate neurologic diathesis or thrombocytopenia, brain metastases, recent major trauma, major abdominal surgery within past 2 d, GI/GU bleed within 14 d, endocarditis, severe HTN (sBP >200 or dBP >120), recent stroke

**Table 30. Contraindications of Anticoagulant Therapy**

**Treatment of Pulmonary Embolism**
- see Respiniology, R18

---

**Hemotechn Malignancies and Related Disorders**

**Figure 14. Overview of hematologic malignancies and related disorders**

**Myeloid Malignancies**

**Acute Myeloid Leukemia**

**Definition**
- rapidly progressive malignancy characterized by failure of myeloid cells to differentiate beyond blast stage

**Epidemiology**
- incidence increases with age; median age of onset is 65 yr old
- accounts for 10-15% of childhood leukemias

**Risk Factors**
- myelodysplastic syndromes (MDS), benzene, radiation, Down Syndrome, alkylating agents as treatment for previous malignancy
Pathophysiology
- etiology subdivided into
  - primary: de novo
  - secondary: hematologic malignancies (e.g. myeloproliferative disorders and MDS) or previous chemotherapeutic agents (e.g. alkylating agents)
- uncontrolled growth of blasts in marrow leads to
  - suppression of normal hematopoietic cells
  - appearance of blasts in peripheral blood
  - accumulation of blasts in other sites (e.g. skin, gums)
  - metabolic consequences; tumour lysis syndrome

Clinical Features
- anemia, thrombocytopenia (associated with DIC in promyelocytic leukemia), neutropenia (even with normal WBC), leads to infections, fever
- accumulation of blast cells in marrow
  - skeletal pain, bony tenderness (especially sternum)
- organ infiltration
  - gingival hypertrophy (particularly myelomonocytic leukemia) – may present to dentist first
  - hepatosplenomegaly (in ALL)
  - lymphadenopathy (not marked in ALL)
  - gonads (in ALL)
  - skin: leukemia cutis
  - eyes: Roth spots, cotton wool spots, vision changes (uncommon)
- leukostasis/hyperleukocytosis syndrome (medical emergency)
  - large numbers of blasts interfere with circulation and lead to hypoxia and hemorrhage – can cause diffuse pulmonary infiltrates, CNS bleeding, respiratory distress, altered mental status, priapism
  - associated with AML more than ALL
- metabolic effects; aggravated by treatment (rare)
  - increased uric acid → nephropathy, gout
  - release of phosphate → decreased Ca²⁺, decreased Mg²⁺
  - release of procoagulants → DIC (higher risk in acute promyelocytic leukemia)
  - decreased or normal K⁺ before treatment, increased K⁺ after treatment (from lysed cells)

Investigations
- blood work
  - CBC: anemia, thrombocytopenia, variable WBC
  - INR, aPTT, fibrin degradation products (FDP), fibrinogen (in case of DIC)
  - increased LDH, increased uric acid, increased PO₄³⁻ (released by leukemic blasts), decreased Ca²⁺, decreased K⁺
  - baseline renal and liver function tests
- peripheral blood film – circulating blasts with Auer rods (azurophilic granules) are pathognomonic for AML
- bone marrow aspirate
  - blast count: AML >20% (normal is <5%)
  - morphologic, cytochemical, and/or immunotypic features are used to establish lineage and maturation (see sidebar for WHO classification of AML, H37)
- CXR to rule out pneumonia, ECG, MUGA scan prior to chemotherapy (cardiotoxic)

Treatment
- mainstay of treatment is chemotherapy (rapidly fatal without treatment)
  - all AML subtypes are treated similarly, except acute promyelocytic leukemia (APL) with t(15:17) translocation
    - all-trans-retinoic acid (ATRA) added to induce differentiation; arsenic trioxide + ATRA combination therapy for APL is non-inferior to traditional chemotherapy
  - treatment strategy
    1. Induction: chemotherapy to induce complete remission of AML (see sidebar)
      - several possible regimens (e.g. cytarabine with anthracycline [daunorubicin])
      - patients with poor response to initial induction therapy – worse prognosis
      - must ensure reversal of DIC, platelet transfusions if <10
    2. Consolidation: to prevent recurrence
      - intensive consolidation chemotherapy
      - stem cell transplantation – autologous or allogeneic (younger patients with better performance status)
  - consider acceleration with hematopoietic growth factors (e.g. G-CSF) if severe infection develops
  - supportive care
    - screening for infection via regular C&S of urine, stool, sputum, oropharynx, catheter sites, perianal area
    - fever: C&S of all orifices, CXR, start antibiotics
    - platelet and RBC transfusions (irradiated to prevent transfusion-related GVHD) ± EPO
    - prevention and treatment of metabolic abnormalities
      - allopurinol, rasburicase for prevention of hyperuricemia
Prognosis
- achievement of first remission
  - 70-80% if ≤60 yr old, 50% if >60 yr old median survival 12-24 mo
  - 5 yr survival 40%
  - prognosis is most related to cytogenetics; classified as favourable, intermediate, or adverse

Myelodysplastic Syndromes

Definition
- heterogeneous group of malignant stem cell disorders characterized by dysplastic and ineffective blood cell production resulting in peripheral cytopenias
- syndromes defined according to World Health Organization (WHO) classifications

Pathophysiology
- disordered maturation: ineffective hematopoiesis despite presence of adequate numbers of progenitor cells in bone marrow (usually hypercellular)
- both processes lead to reduced mature cells in periphery
- <30% develop AML

Risk Factors
- elderly, post-chemotherapy, benzene or radiation exposure
- occurs in 4/100,000 patients >60 yr old

Clinical Features
- insidious onset: associated with pancytopenia
- infections and bleeding out of proportion with peripheral blood counts

Investigations
- diagnosed by
  - anemia ± thrombocytopenia ± neutropenia
  - CBC and peripheral blood film
  - RBC: usually macrocytic with oval shaped red cells (macro-ovalocytes), decreased reticulocyte count
  - WBC: decreased granulocytes and abnormal morphology (e.g. bilobed or unsegmented nuclei = Pelger abnormality)
  - platelets: thrombocytopenia, abnormalities of size and cytoplasm (e.g. giant hypogranular platelets)
- bone marrow aspirate and biopsy with cytogenetic analysis required for definitive diagnosis
- bone marrow: dysplastic and often normocellular/hypercellular
- cytogenetics: partial or total loss of chromosomes 5, 7, Y, or trisomy 8

Treatment
- low risk of transformation to acute leukemia (IPSS-R Very Low or Low)
  - erythropoietin stimulating agents weekly is first line in reducing transfusion requirements
  - If 5q deletion based on cytogenics: lenalidomide PO supportive care: RBC and platelet transfusion (consider iron chelation if frequent RBC transfusions)
- high risk of transformation to acute leukemia (IPSS-R Intermediate, High or Very High)
  - supportive care
  - stem cell transplantation if age <65 yr
  - epigenetic therapy: DNA methyltransferase inhibitors (e.g. 5-azacytidine), histone deacetylase inhibitors

Prognosis
- Revised International Prognostic Scoring System (IPSS-R) uses 5 factors to estimate mean survival
  - cytology, % bone marrow blasts, hemoglobin, platelets, absolute neutrophil count
  - based on the calculated score, a patient's MDS prognostic risk is "Very Low", "Low", "Intermediate", "High", or "Very High" with a mean survival of 8.7, 5.3, 3.0, 1.6, and 0.8 yr, respectively

Myeloproliferative Neoplasms

Definition
- clonal myeloid stem cell abnormalities leading to overproduction of one or more cell lines (leading to abnormalities in erythrocytes, platelets, and other cells of myeloid lineage)

Epidemiology
- mainly middle-aged and older patients (peak 60-80 yr)
**Prognosis**
- may develop marrow fibrosis with time
- all disorders may progress to AML

**Table 31. Chronic Myeloproliferative Disorders**

CML = chronic myeloid leukemia; ET = essential thrombocythemia; IMF = idiopathic myelofibrosis; PV = polycythemia vera

---

**Chronic Myeloid Leukemia**

**Definition**
- myeloproliferative disorder characterized by increased proliferation of the granulocytic cell line without the loss of their capacity to differentiate

**Epidemiology**
- occurs in any age group (mostly middle age to elderly) with a median age of 65 yr

**Pathophysiology**
- Philadelphia chromosome (Ph)
  - translocation between chromosomes 9 and 22
  - the c-abl proto-oncogene is translocated from chromosome 9 to “breakpoint cluster region” (bcr) of chromosome 22 to produce bcr-abl fusion gene, an active tyrosine kinase

**Clinical Features**
- 3 clinical phases
  - chronic phase: 85% diagnosed here
    - few blasts (<10%) in peripheral film
    - ± slightly elevated eosinophils and basophils
    - no significant symptoms
  - accelerated phase: impaired neutrophil differentiation
    - circulating blasts (10-19%) with increasing peripheral basophils (pruritus)
    - CBC: thrombocytopenia <100 x 10^9/L
    - cytogenetic evidence of clonal evolution
    - worsening constitutional symptoms and splenomegaly (extramedullary hematopoiesis)
  - blast crisis: more aggressive course, blasts fail to differentiate
    - blasts (>20%) in peripheral blood or bone marrow; reflective of acute leukemia (1/3 ALL, 2/3 AML)
    - clinical presentation
      - 20-50% of patients are asymptomatic when diagnosed (incidental lab finding)
      - nonspecific symptoms
        - fatigue, weight loss, malaise, excessive sweating, fever
      - secondary to splenic involvement
        - early satiety, LUQ pain/fullness, shoulder tip pain (referred)
      - splenomegaly (most common physical finding)
      - anemia
      - bleeding: secondary to platelet dysfunction
      - pruritus, PUD: secondary to increased blood histamine
      - leukostasis, priapism, encephalopathy (rare): secondary to very elevated WBC (rare)

**Investigations**
- elevated WBC, decreased/normal RBC, increased/decreased platelets, increased basophils
- WBC differential shows a bimodal distribution, with predominance of myelocytes and neutrophils
- peripheral blood film
  - leukoerythroblastic picture (immature red cells and granulocytes present, e.g. myelocytes and normoblasts)
  - presence of different mid-stage progenitor cells differentiates it from AML
- bone marrow
  - myeloid hyperplasia with left shift, increased megakaryocytes, mild fibrosis
  - molecular and cytogenetic studies of bone marrow or peripheral blood for Philadelphia chromosome
- abdominal imaging for spleen size

---

**Chronic Myeloproliferative Neoplasms: Six Year Follow-Up of Patients Receiving Imatinib for the First-Line Treatment of CML**

**Study**
- The Randomized Study of Interferon vs. STI571 (IRIS) trial enrolled patients with chronic phase chronic myeloid leukemia (CML-CP) to either imatinib (n=533) or interferon-α (IFN) plus cytarabine (n=553).

**Results**
- Assessing the imatinib arm specifically at the sixth year point, there were no reports of disease progression to accelerated phase (AP) or blast crisis (BC), toxicity profile was unchanged, and cytogenetic response rate was 82%. Estimated event-free survival was 83% and rate of freedom from progression to AP and BC was 93%.

**Conclusion**
- This 6-year update of IRIS demonstrates the efficacy and safety of imatinib as first-line therapy for CML patients.

Basophilia is uncommon in other medical conditions
Treatment

• symptomatic
  ▪ allopurinol and antihistamines

• chronic phase
  ▪ imatinib mesylate inhibits proliferation and induces apoptosis by inhibiting tyrosine kinase activity in cells positive for bcr-abl
    • if loss of response or intolerance (~25%), trial of 2nd (dasatinib) or 3rd (nilotinib) generation inhibitors
    • dasatinib and nilotinib may also be considered for first line management
  ▪ interferon-α: may improve response to tyrosine kinase inhibitors; typically now only used for pregnant patients
  ▪ hydroxyurea in palliative setting to reduce WBC

• accelerated phase or blast phase
  ▪ refer for clinical trial or 2nd/3rd generation TKI and prepare for allogeneic stem cell transplant patients, in blast phase typically get standard AML induction
  ▪ stem cell transplantation may be curative: to be considered in young patients who do not meet therapeutic milestones
  ▪ treatment success is monitored based on therapeutic milestones
    ▪ hematologic: improved WBC and platelet counts, reduced basophils
    ▪ cytogenetic: undetectable Philadelphia-chromosome in the bone marrow
    ▪ molecular: reduction/absence of bcr-abl transcripts in periphery and marrow

Prognosis

• survival dependent on response
  ▪ those achieving complete cytogenetic response (CCR) on imatinib by 18 mo of therapy: 6 yr overall survival >90%
  ▪ those who do NOT achieve CCR on imatinib: 6 yr overall survival of 66%
  ▪ acute phase (blast crisis – usually within 3-5 yr)
    ▪ 2/3 develop a picture similar to AML
    ▪ unresponsive to remission induction
  ▪ 1/3 develop a picture similar to ALL
    ▪ remission induction (return to chronic phase) achievable

Polycythemia Vera

Definition

• stem cell disorder characterized by elevated RBC mass (erythrocytosis) ± increased white cell and platelet production

Clinical Features

• symptoms are secondary to high red cell mass and hyperviscosity (see Erythrocytosis, H6)
  ▪ bleeding complications: epistaxis, gingival bleeding, ecchymoses, and GI bleeding
    ▪ due to platelet abnormalities
  ▪ thrombotic complications: DVT, PE, thrombophlebitis, increased incidence of stroke, MI
    ▪ due to increased blood viscosity, increased platelet number and/or activity
  ▪ erythromelalgia (burning pain in hands and feet and erythema of the skin)
    ▪ associated with platelets >400 x 10^9/L
    ▪ pathognomonic microvascular thrombotic complication in PV and ET
  ▪ pruritus, especially after warm bath or shower (40%)
    ▪ due to cutaneous mast cell degranulation and histamine release
  ▪ epigastric distress, PUD
    ▪ due to increased histamine from tissue basophils, alterations in gastric mucosal blood flow due to increased blood viscosity
  ▪ gout (hyperuricemia)
    ▪ due to increased cell turnover
  ▪ characteristic physical findings
    ▪ plethora (ruddy complexion) of face (70%), palms splenomegaly (70%), hepatomegaly (40%)

Investigations

• see Erythrocytosis, H6
  ▪ must rule out secondary polycythemia
  ▪ diagnosis (WHO 2008) requires either both major criteria plus one minor criteria OR the first major criterion plus 2 minor criteria
    ▪ Major Criteria
      1. hemoglobin >185 g/L in men, >165 g/L in women or other evidence of increased red cell volume
      2. presence of JAK2 V617F or other functionally similar mutation such as JAK2 exon 12 mutation
Minor Criteria
1. bone marrow biopsy showing hypercellularity for age with trilineage growth (panmyelosis) with prominent erythroid, granulocytic, and megakaryocytic proliferation
2. serum erythropoietin level below the reference range for normal
3. endogenous erythroid colony formation in vitro

Treatment
- phlebotomy to keep hematocrit <45%
- hydroxyurea (prior thrombosis or symptoms, severe coronary artery disease, refractory to phlebotomy)
- low-dose Aspirin® (for antithrombotic prophylaxis, will also treat erythromelalgia)
- allopurinol: as needed
- antihistamines: as needed

Prognosis
- 10-20 yr survival with treatment
- complicated by thrombosis, hemorrhage, leukemic transformation (AML)

Idiopathic Myelofibrosis

Definition
- excessive bone marrow fibrosis leading to marrow failure
- characterized by anemia, extramedullary hematopoiesis, leukoerythroblastosis, teardrop red cells in peripheral blood and hepatosplenomegaly

Epidemiology
- rare, median age at presentation is 65 yr

Pathophysiology
- abnormal myeloid precursor postulated to produce dysplastic megakaryocytes that secrete fibroblast growth factors
  - stimulates fibroblasts and stroma to deposit collagen in marrow
- increasing fibrosis causes early release of hematopoietic precursors leading to:
  - leukoerythroblastic blood film (primitive RBCs and WBCs present in blood)
  - migration of precursors to other sites: extramedullary hematopoiesis (leading to hepatosplenomegaly)

Clinical Features
- anemia (severe fatigue is most common presenting complaint, pallor on exam in >60%)
- weight loss, fever, night sweats → secondary to hypermetabolic state
- splenomegaly (90%) → secondary to extramedullary hematopoiesis; may cause early satiety
- hepatomegaly (70%) → may get portal hypertension
- bone and joint pain → secondary to osteosclerosis, gout
- signs of extramedullary hematopoiesis (depends on organ involved)

Investigations
- CBC: anemia, variable platelets, variable WBC
- biochemistry: increased ALP (liver involvement, bone disease), increased LDH (2° to ineffective hematopoiesis), increased uric acid (increased cell turnover), increased B12 (2° to increased neutrophil mass)
- blood film: leukoerythroblastosis with teardrop RBCs, nucleated RBCs, variable polychromasia, large platelets, and megakaryocyte fragments
- JAK2 PCR and calreticulin PCR
- bone marrow aspirate: “dry tap” in as many as 50% of patients (no blood cells aspirated)
- bone marrow biopsy (essential for diagnosis): fibrosis, atypical megakaryocytic hyperplasia, thickening and distortion of the bony trabeculae (osteosclerosis)

Treatment
- allogeneic stem cell transplant is potentially curative
- JAK2 inhibitors
- symptomatic treatment
  - transfusion for anemia
  - erythropoietin: 30-50% of patients respond
  - androgens for anemia (e.g. danazol has shown transient response with response rates of <30%)
  - hydroxyurea for splenomegaly, thrombocytosis, leukocytosis, systemic symptoms
    - interferon-α (as second line therapy)
  - splenectomy (as third line therapy; associated with high mortality and morbidity)
  - radiation therapy for symptomatic extramedullary hematopoiesis, symptomatic splenomegaly
  - thalidomide, and etanercept may improve quality of life and spleen size, but not survival

Efficacy and Safety of Low-dose Aspirin® in Polycythemia Vera
NEJM 2004;350:114-124
Study: Double-blind, placebo-controlled, RCT
Participants: 518 patients with polycythemia vera (PV) with no clear indication for, or contraindication to, ASA therapy.
Intervention: Patients received either low-dose ASA 100 mg daily (n=253) or placebo (n=265) and were followed for up to 5 yr.
Primary Outcome: Cumulative rate of (I) nonfatal MI, nonfatal stroke, or death from cardiovascular causes and the cumulative rate of (II) the previous 3 plus FE and major venous thrombosis.
Results: Primary outcomes (I) and (II) were reduced with treatment compared to placebo (RR 0.41; p=0.09 and RR 0.4; p=0.03, respectively). There were no differences in overall or cardiovascular mortality and major bleeding episodes.
Conclusion: Low-dose ASA can safely prevent thrombotic complications in patients with PV.

Myelofibrosis can be either primary (idiopathic) or occur as a transformation of an antecedent PV or ET

An “leukoerythroblastic” blood film (RBC and granulocyte precursors) implies bone marrow infiltration with malignancy (e.g. leukemias, solid tumour metastases) or fibrosis (e.g. IMF)

IMF typically has a dry BM aspirate and teardrop RBCs (aspiration gives no blood cells)

A Double-Blind, Placebo-Controlled Trial of Ruxolitinib for Myelofibrosis
NEJM 2012;366:799-807
Study: Double-blind RCT of 309 patients with myelofibrosis randomized to ruxolitinib or placebo.
Outcome: Primary outcome was reduction in spleen volume of >35% at 24 wk. Secondary outcomes were durability of response, symptom burden, and overall survival.
Results: A greater proportion of patients on ruxolitinib had reduction in spleen volume >35% (41.9% vs. 5.7%) and this was sustained in 67% at 48 wk. Ruxolitinib also led to greater symptom improvement (45% vs. 5.3%) and less mortality (13 vs. 24). There was no difference in rate of discrimination due to adverse events (11.2% vs. 10.8%) but anemia and thrombocytopenia were more common with ruxolitinib.
Conclusions: Ruxolitinib reduced spleen size, improved symptoms and improved survival, compared with placebo.
Prognosis
- International Prognostic Scoring System (IPSS) for IMF uses 5 factors to determine mean survival
  - presence of constitutional symptoms; age >65; hemoglobin <100 g/L; leukocyte count >25,000/mm³; circulating blast cells ≥1%
  - based on the calculated score, a patient’s IMF is categorized as “low”, “intermediate 1”, “intermediate 2”, or “high” with a mean survival of 135, 95, 48, and 27 mo respectively
- risk of transformation to AML (8-10%)

Essential Thrombocytopenia

Definition
- overproduction of platelets in the absence of recognizable stimulus
- must rule out secondary thrombocytopenia

Epidemiology
- increases with age; F:M = 2:1, but F=M at older age

Diagnosis (2008 WHO Criteria) requires meeting all four criteria:
1. sustained platelet count >450 x 10⁹/L
2. bone marrow biopsy specimen showing proliferation mainly of the megakaryocytic lineage with increased number of enlarged, mature megakaryocytes; no significant increase or left shift of neutrophil granulopoiesis or erythropoiesis
3. not meeting WHO criteria for PV, primary myelofibrosis, bcr-abl CML, or myelodysplastic syndrome or other myeloid neoplasms
4. demonstration of JAK2 V617F or calreticulin (or in its absence another clonal marker), no evidence for reactive thrombocytosis

Clinical Features
- often asymptomatic
- vasomotor symptoms (40%)
  - headache (common), dizziness, syncope
  - erythromelalgia (burning pain of hands and feet, dusky colour, usually worse with heat, caused by platelet activation → microvascular thrombosis)
- thrombosis (arterial and venous)
- bleeding (often GI; associated with platelets >1,000 x 10⁹/L)
- constitutional symptoms, splenomegaly
- pregnancy complications: increased risk of spontaneous abortion
- risk of transformation to AML (0.6-5%), myelofibrosis

Investigations
- CBC: increased platelets; may have abnormal platelet aggregation studies
- JAK2 PCR assay
- bone marrow hypercellularity, megakaryocytic hyperplasia, giant megakaryocytes
- increased K⁺, increased PO₄³⁻ (2⁻ to release of platelet cytoplasmic contents)
- diagnosis: exclude other myeloproliferative disorders and reactive thrombocytosis

Treatment
- low dose ASA if previous history of thrombotic event, ≥1 cardiovascular risk factors, older, or symptomatic
- cytotherapeutic therapy if thrombosis or thrombotic symptoms: hydroxyurea (HU) (1st line therapy), anagrelide, interferon-α, or 3²P (age >80 or lifespan <10 yr)
- splenectomy not recommended (increased risk of bleeding episodes, thrombosis)

Lymphoid Malignancies

Acute Lymphoblastic Leukemia

Definition
- malignant disease of the bone marrow in which early lymphoid precursors proliferate and replace the normal hematopoietic cells of the marrow
- WHO subdivides ALL into two types depending on cell of origin
  1. B-cell: precursor B lymphoblastic leukemia
  2. T-cell: precursor T lymphoblastic leukemia
- the French-American-British (FAB) classification (L1, L2, L3) is no longer encouraged, as morphology is not prognostic

75% of ALL occurs in children <6 yr old; second peak at age 40
Clinical Features
- see Acute Myeloid Leukemia, H37 for full list of symptoms
- distinguish ALL from AML based on Table 32
- clinical symptoms usually secondary to:
  - bone marrow failure: anemia, neutropenia (50% present with fever; also infections of oropharynx, lungs, perianal region), thrombocytopenia
  - organ infiltration: tender bones, lymphadenopathy, hepatosplenomegaly, meningeal signs (headache, N/V, visual symptoms; especially in ALL relapse)

Investigations
- CBC: increased leukocytes >10 x 10^9/L (occurs in 50% of patients); neutropenia, anemia, or thrombocytopenia
- may have increased uric acid, K^+, PO_4^{3-}, Ca^{2+}, LDH
- PT, aPTT, fibrinogen, D-dimers for DIC
- leukemic lymphoblasts lack specific morphological (no granules) or cytochemical features, therefore diagnosis depends on immunophenotyping
- cytogenetics: Philadelphia (Ph) chromosome in ~25% of adult ALL cases
- CXR: patients with ALL may have a mediastinal mass
- LP prior to systemic chemotherapy to assess for CNS involvement (ensure adequate platelet count and PT/PTT)

Treatment
- eliminate abnormal cloned cells
  1. Induction: to induce complete remission (undetectable leukemic blasts, restore normal hematopoiesis)
  2. Consolidation and/or intensification of chemotherapy
     - consolidation: continuing same chemotherapy to eliminate subclinical leukemic cells
     - intensification: high doses of different (non-cross-reactive) chemotherapy drugs to eliminate cells with resistance to primary treatment
  3. Maintenance chemotherapy: low dose intermittent chemotherapy over prolonged period (2-3 yr) to prevent relapse
  4. Prophylaxis: CNS radiation therapy or methotrexate (intrathecal or systemic)
     - hematopoietic stem cell transplantation: potentially curative (due to pre-implant myeloablative chemoradiation and post-implant graft-versus-leukemia effect) but relapse rates and non-relapse mortality high

Prognosis
- depends on response to initial induction or if remission is achieved following relapse
- good prognostic factors: young, WBC <30 x 10^9/L, T-cell phenotype, absence of Ph chromosome, early attainment of complete remission
- achievement of first remission: 60-90%
- childhood ALL: 80% long-term remission (>5 yr)
  - higher cure rates in children because of better chemotherapy tolerance, lower prevalence of bcr-abl fusion gene (associated with chemotherapeutic resistance)
- adult ALL: 30-40% 5-yr survival

Lymphomas

Definition
- collection of lymphoid malignancies in which malignant lymphocytes accumulate at lymph nodes and lymphoid tissues
  - leading to lymphadenopathy, extranodal disease, and constitutional symptoms

American Society of Hematology
Choosing Wisely Recommendation
Limit surveillance CT scans in asymptomatic patients after curative-intent treatment for aggressive lymphoma

### Hodgkin Lymphoma

**Definition**
- malignant proliferation of lymphoid cells with Reed-Sternberg cells (thought to arise from germinal centre B-cells)

**Epidemiology**
- bimodal distribution with peaks at 20 yr and >50 yr
- association with Epstein-Barr virus in up to 50% of cases, causal role not determined

**Clinical Features**
- asymptomatic lymphadenopathy (70%)
  - non-tender, rubbery consistency
  - cervical/supraclavicular (60-80%), axillary (10-20%), inguinal (6-12%)
- splenomegaly (50%) ± hepatomegaly
- mediastinal mass
  - found on routine CXR, may be symptomatic (cough)
  - rarely may present with SVC syndrome, pleural effusion
- systemic symptoms
  - B symptoms (especially in widespread disease; fever in 30%), pruritus
  - non-specific/paraneoplastic
    - alcohol-induced pain in nodes, nephrotic syndrome
    - starts at a single site in lymphatic system (node), spreads first to adjacent nodes
  - disease progresses in contiguity with lymphatic system

**Investigations**
- CBC
  - anemia (chronic disease, rarely hemolytic), eosinophilia, leukocytosis, platelets normal or increased early, decreased in advanced disease
  - biochemistry
    - HIV serology
    - LFTs (liver involvement)
    - renal function tests (prior to initiating chemotherapy)
    - ALP, Ca²⁺ (bone involvement)
    - ESR, LDH (monitor disease progression)
- imaging
  - CXR, CT chest (lymph nodes, mediastinal mass), CT abdomen/pelvis (liver or spleen involvement), gallium scan (assess treatment response), PET scans
  - cardiac function assessment (MUGA scan or echocardiography): for patients at high risk of pre-treatment cardiac disease (age >60, history of HTN, CHF, PUD, CAD, MI, CVA), treatment can be cardiotoxic
  - PFTs: if history of lung disease (COPD, smoking, previous radiation to lung)
- excisional lymph node biopsy confirms diagnosis
- bone marrow biopsy to assess marrow infiltration (only necessary if B-symptoms, stage III or IV, bulky disease or cytopenia)
Treatment

- stage I-II: chemotherapy (ABVD) followed by involved field radiotherapy (XRT)
- stage III-IV: chemotherapy (ABVD) with XRT for bulky disease
- relapse, resistant to therapy: high dose chemotherapy, bone marrow transplant
  - new imaging modalities increasingly used including PET scans (follow treatment response)

Complications of Treatment

- cardiac disease: secondary to XRT, adriamycin is also cardiotoxic
- pulmonary disease: secondary to bleomycin (interstitial pneumonitis)
- infertility: recommend sperm banking
- secondary malignancy in irradiated field
  - <2% risk of MDS, AML (secondary to treatment, usually within 8 yr)
  - solid tumours of lung, breast; >8 yr after treatment
- non-Hodgkin lymphoma
- hypothyroidism: post XRT

Prognosis

- Hasenclever adverse prognostic factors:
  1. serum albumin <40 g/L
  2. hemoglobin <105 g/L
  3. male
  4. stage IV disease
  5. age ≥45 yr
  6. leukocytosis (WBC >1.5 x 10⁹/L)
  7. lymphocytopenia (lymphocytes <0.06 x 10⁹/L or <8% of WBC count or both)
- prognostic score
  - each additional adverse prognostic factor decreases freedom from progression at 5 yr (FFP)

Non-Hodgkin Lymphoma

Definition

- malignant proliferation of lymphoid cells of progenitor or mature B- or T-cells

Classification

- multiple classification systems exist at present and may be used at different centres
- can originate from both B- (85%) and T- or NK- (15%) cells
  - B-cell NHL: e.g. diffuse large B-cell lymphoma, follicular lymphoma, Burkitt's lymphoma, mantle cell lymphoma
  - T-cell NHL: e.g. mycosis fungoides, anaplastic large cell lymphoma
- WHO/REAL classification system: 3 categories of NHLs based on natural history
  - indolent (35–40% of NHL): e.g. follicular lymphoma, small lymphocytic lymphoma/CLL, mantle cell lymphoma
  - aggressive (~50% of NHL): e.g. diffuse large B-cell lymphoma
  - highly aggressive (~5% of NHL): e.g. Burkitt's lymphoma

Clinical Features

- painless superficial lymphadenopathy, usually >1 lymph node region
- usually presents as widespread disease (exception is aggressive lymphoma)
- constitutional symptoms not as common as in Hodgkin lymphoma
- cytopenia: anemia ± neutropenia ± thrombocytopenia can occur when bone marrow is involved
- abdominal signs
  - hepatosplenomegaly
  - retroperitoneal and mesenteric involvement (second most common site of involvement)
- oropharyngeal involvement in 5-10% with sore throat and obstructive apnea
- extranodal involvement: most commonly GI tract; also testes, bone, kidney
- CNS involvement in 1% (often with HIV)

Investigations

- CBC
  - normocytic normochromic anemia
  - autoimmune hemolytic anemia
  - advanced disease: thrombocytopenia, neutropenia, and leukoerythroblastic anemia
- peripheral blood film may show lymphoma cells
- flow cytometry of peripheral blood is valuable for low-grade NHL
- biochemistry
  - increase in uric acid
  - abnormal LFTs in liver metastases
  - increased LDH (rapidly progressing disease, poor prognostic factor)
- CXR, CT neck, abdomen, pelvis for staging

FFP = freedom from progression at 5 yr

Treatment of HL depends on stage; treatment of NHL depends on histologic subtype.
• PET is useful for monitoring response to treatment and evaluation of residual tumour following therapy in aggressive histological disease
• diagnosed by
  ▪ lymph node biopsy: excisional biopsy preferred, FNA unreliable
  ▪ bone marrow biopsy: not optimal for diagnosis as BM may not be involved

Treatment
• localized disease (e.g. GI, brain, bone, head and neck)
  ▪ radiotherapy to primary site and adjacent nodal areas
  ▪ adjuvant chemotherapy
  ▪ surgery: splenic marginal zone lymphoma
• indolent lymphoma: goal of treatment is symptom management
  ▪ watchful waiting
  ▪ radiation therapy for localized disease
  ▪ bendamustine plus rituximab, an anti-CD20 antibody, is superior to CHOP + rituximab (CHOP-R) for advanced stage disease (STIL trial)
• aggressive lymphoma: goal of treatment is curative
  ▪ combination chemotherapy: CHOP is mainstay, plus rituximab if B-cell lymphoma
  ▪ radiation for localized/bulky disease
  ▪ CNS prophylaxis with high-dose methotrexate if certain sites involved (testicular, nasopharyngeal)
  ▪ relapse, resistant to therapy: high dose chemotherapy, BMT
• highly aggressive lymphoma
  ▪ Burkitt lymphoma: short bursts of intensive chemotherapy “CODOX-M” chemotherapy regimen also often used ± IVAC with Rituximab
  ▪ CNS prophylaxis and tumour lysis syndrome prophylaxis

Complications
• hypersplenism
• infection
• autoimmune hemolytic anemia and thrombocytopenia
• vascular obstruction (from enlarged nodes)
• bowel perforation
• tumour lysis syndrome (particularly in very aggressive lymphoma) see Tumour Lysis Syndrome H52

Prognosis
• follicular lymphoma: Follicular Lymphoma International Prognostic Index is used (5 adverse prognostic factors): age >60; >4 nodal areas; elevated LDH; Ann Arbor stage III-IV; hemoglobin <120 g/L
  ▪ based on calculated risk, mean 5 yr survival ranges from 53-91%
  ▪ rarely curative, typically relapsing and remitting course with risk of transformation to aggressive lymphomas such as diffuse large B-cell lymphoma
• diffuse large B-cell lymphoma: The International Prognostic Factor Index is used (5 adverse prognostic factors): age >60; Ann Arbor stage (III-IV); performance status (ECOG/Zubrand 2-4); elevated LDH; >1 extranodal site
  ▪ based on calculated risk, mean 5 yr survival ranges from 26-73%
  ▪ ~40% rate of cure

*LAD = lymphadenopathy
### Chronic Lymphocytic Leukemia

**Definition**
- indolent disease characterized by clonal malignancy of mature B-cells

**Epidemiology**
- most common leukemia in Western world
- mainly older patients; median age 65 yr
- M>F

**Pathophysiology**
- accumulation of neoplastic lymphocytes in blood, bone marrow, lymph nodes, and spleen

**Clinical Features**
- 25% asymptomatic (incidental finding)
- 5-10% present with B-symptoms (≥1 of: unintentional weight loss ≥10% of body weight within previous 6 mo, temperature >38°C or night sweats for ≥2 wk without evidence of infection, extreme fatigue)
- lymphadenopathy (50-90%), splenomegaly (25-55%), hepatomegaly (15-25%)
- immune dysregulation: autoimmune hemolytic anemia (Coombs positive), ITP, hypogammaglobulinemia ± neutropenia
- bone marrow failure: late, secondary to marrow involvement by CLL cells

**Investigations**
- CBC: clonal population of CLL lymphocytes >5 x 10⁹/L
- peripheral blood film
  - lymphocytes are small and mature
  - smudge cells
- flow cytometry (CD5, CD20, CD23, etc.)
- cytogenetics: FISH (dictates response therapy and prognosis)
- bone marrow aspirate
  - lymphocytes >30% of all nucleated cells
  - infiltration of marrow by lymphocytes in 4 patterns: nodular (10%), interstitial (30%), diffuse (35%, worse prognosis), or mixed (25%)

**Natural History and Treatment**
- natural history: indolent and incurable; most cases show slow progression
- small minority present with aggressive disease; usually associated with chromosomal abnormalities (e.g. p53 deletion)
- first line therapy is dictated by cytogenetic status and patient co-morbidities
  - observation if early, stable, asymptomatic treatment options vary by region; ideal first line therapy should include a monoclonal CD20 agent (e.g. rituximab, ofatumumab, obinutuzumab)
  - commonly fludarabine + cyclophosphamide + rituximab (FCR) in fit patients with normal CrCl; bendamustine + rituximab (BR) in less fit
  - chlorambucil + anti-CD20 in the elderly
  - corticosteroids, IVIg: especially for autoimmune phenomenonradiotherapy
• molecular therapies
  ▪ Idelalisib – PI3K inhibitor
  ▪ Ibrutinib – BTK (Bruton's tyrosine kinase) inhibitor

Prognosis
• 9 yr median survival, but varies greatly
• prognosis predicted by Rai staging and cytogenetic status
  ▪ low risk: lymphocytosis in blood and bone marrow only
  ▪ intermediate risk: lymphocytosis with enlarged nodes in any site or splenomegaly, hepatomegaly
  ▪ high risk: lymphocytosis with disease-related anemia (<110 g/L) or thrombocytopenia (<100 x 10^9/L)

Complications
• bone marrow failure
• immune complications: AIHA, ITP, immune deficiency (hypogammaglobulinemia, impaired T-cell function)
• polyclonal or monoclonal gammapathy (often IgM)
• hyperuricemia with treatment
• 5% undergo Richter's transformation: aggressive transformation to diffuse large B-cell lymphoma (see Table 35)

Multiple Myeloma

Definition
• neoplastic clonal proliferation of plasma cells producing a monoclonal immunoglobulin resulting in end organ dysfunction
• usually single clone of plasma cells, although biclonal myeloma also occurs; rarely non-secretory

Epidemiology
• incidence 3 per 100,000, most common plasma cell malignancy
• increased frequency with age; median age of diagnosis is 68 yr; M>F

Pathophysiology
• malignant plasma cells secrete monoclonal antibody
  ▪ 95% produce M protein (monoclonal Ig = identical heavy chain + identical light chain, or light chains only)
    ▪ IgG 50%, IgA 20%, IgD 2%, IgM 0.5%
    ▪ 15-20% produce free light chains or light chains alone found in either:
      – serum as an increase in the quantity of either kappa or lambda light chain (with an abnormal kappa:lambda ratio)
      – urine has Bence-Jones protein
  ▪ <5% are non-secretors

Clinical Features and Complications
• bone disease: pain (usually back), bony tenderness, pathologic fractures
  ▪ lytic lesions are classical (skull, spine, proximal long bones, ribs)
  ▪ increased bone resorption secondary to osteoclast activating factors such as PTHrP
• anemia: weakness, fatigue, pallor
  ▪ secondary to bone marrow suppression
• weight loss
• infections
  ▪ usually S. pneumoniae and Gram-negatives
  ▪ secondary to suppression of normal plasma cell function
• hypercalcemia: N/V, confusion, constipation, polyuria, polydipsia
  ▪ secondary to increased bone turnover
• renal disease/renal failure
  ▪ most frequently causes cast nephropathy (see Nephrology, NP31)
• bleeding
  ▪ secondary to thrombocytopenia, may see petechiae, purpura
  ▪ can also be caused by acquired von Willebrand disease
• extramedullary plasmacytoma
  ▪ soft tissue mass composed of monoclonal plasma cells, purplish colour
• hyperviscosity: may manifest as headaches, stroke, angina, MI
  ▪ secondary to increased viscosity caused by M protein

CRAB
Increased Calcium
Renal failure
Anemia
Bony lesions (lytic lesions or osteoporosis felt to be caused by myeloma)

Amyloid
The general term for a variety of proteinaceous materials that have a similar structural organization and are abnormally deposited in tissues
Found in a variety of clinical disorders and can cause systemic (e.g. MM [light chains]) or localized amyloidosis (e.g. Alzheimer disease [AB amyloid])

Hemoglobin
CRAB
Increased Calcium
Renal failure
Anemia
Bony lesions (lytic lesions or osteoporosis felt to be caused by myeloma)
- amyloidosis
  - accumulation of insoluble fibrillar protein (Ig light chain) in tissues; can cause infiltration of any organ system: cardiac infiltration – diastolic dysfunction, cardiac arrhythmias, syncope, sudden death; GI involvement – malabsorption, beefy large or laterally scalloped tongue; neurologic involvement – orthostatic hypotension, carpal tunnel syndrome
  - may cause Factor X deficiency if fibrils bind Factor X → bleeding (raccoon eyes)
- neurologic disease: muscle weakness, pain, paresthesias
  - radiculopathy caused by vertebral fracture, extramedullary plasmacytoma
  - spinal cord compression (10-20% of patients) is a medical emergency

Investigations
- CBC
  - normocytic anemia, thrombocytopenia, leukopenia
  - rouleaux formation on peripheral film
- biochemistry
  - increased Ca\(^{2+}\), increased ESR, decreased anion gap, increased Cr, albumin, \(\beta_2\)-microglobulin (as part of staging), proteinuria (24 h urine collection)
- monoclonal proteins
  - serum protein electrophoresis (SPEP): demonstrates monoclonal protein spike in serum in 80% (i.e. M protein)
  - urine protein electrophoresis (UPEP): demonstrates light chains in urine = Bence-Jones protein (15% secrete only light chains)
  - immunofixation: demonstrates M protein and identifies Ig type; also identifies light chains
  - serum free light chain quantification: kappa and lambda light chains, calculated ratio
- bone marrow aspirate and biopsy
  - often focal abnormality, greater than 10% plasma cells, abnormal morphology, clonal plasma cells; send for FISH or cytogenetics (prognostic implications)
  - skeletal series (x-rays), MRI if symptoms of cord compression
  - presence of lytic lesions and areas at risk of pathologic fracture
  - bone scans are not useful since they detect osteoblast activity
  - \(\beta_2\)-microglobulin, LDH, and CRP are poor prognosticators

Diagnosis
- International Myeloma Working Group Criteria
  1. serum or urinary monoclonal protein
  2. presence of clonal plasma cells in bone marrow or a plasmacytoma
  3. presence of end-organ damage related to plasma cell dyscrasia, such as:
     - increased serum Ca\(^{2+}\)
     - lytic bone lesions
     - anemia
     - renal failure

Treatment
- treatment is non-curative
- treatment goals
  - improvement in quality of life (improve anemia, reverse renal failure, bony pain)
  - prevention of progression and complications
  - increase overall survival
- autologous stem cell transplant if <65 yr old
  - usually preceded by 4-6 mo of cytoreductive therapy: steroid based with novel agents
  - (i.e. immunomodulatory drugs or proteasome inhibitors)
- chemotherapy if >65 yr old or transplant-ineligible
  - melphalan, prednisone, and novel agent (i.e. bortezomib)
- dexamethasone and bortezomib if ARF; bortezomib ± dexamethasone in light chain amyloidosis
- supportive management
  - bisphosphonates for those with osteopenia or lytic bone lesions (requires renal dosing)
  - local XRT for bone pain, spinal cord compression
  - kyphoplasty for vertebral fractures to improve pain relief and regain height
  - treat complications: hydration for hypercalcemia and renal failure, bisphosphonates for severe hypercalcemia, prophylactic antibiotics, erythropoietin for anemia, DVT prophylaxis
- all patients will relapse; choice of retreatment regimen depends on duration of remission, organ involvement, patient's comorbidities, and preferences

Prognosis
- International Staging System (\(\beta_2\)-microglobulin and albumin) used to stage and estimate prognosis
  - cytogenetic profile (i.e. p53 mutation associated with poor survival and resistance to chemotherapy)
  - median survival based on stage, usually 3-7 yr

Routine urinalysis will not detect light chains as dipstick detects albumin. Need sulfosalicylic acid or 24 h urine protein for immunofixation or electrophoresis

Light Chain Disease
15% of MM produce only light chains. Renal failure is a major problem. Kappa > lambda light chain has better prognosis
Monoclonal Gammopathy of Unknown Significance

**Definition**
- presence of M protein in serum in absence of any clinical or laboratory evidence of a plasma cell dyscrasia or lymphoproliferative disorders
  - incidence: 0.15% in general population, 5% of people >70 yr of age
  - asymptomatic

**Diagnosis**
- presence of a serum monoclonal protein (M protein) at a concentration <30 g/L
- <10% plasma cells in bone marrow
- absence of hyperCalcemia, Renal insufficiency, Anemia, Bone disease related to the plasma cell proliferative process (absence of "CRAB")
- 0.3-1% of patients develop a hematologic malignancy each yr
  - patients with M protein peak ≥15 g/L, or patients with IgA or IgM MGUS are at higher risk of malignant transformation
  - patients with abnormal serum free light chains ratio are at increased risk of malignant transformation
- monitor with annual history, physical, CBC, Cr, calcium, albumin, serum protein electrophoresis (considered pre-malignant)

Lymphoplasmacytic Lymphoma (Waldenstrom’s Macroglobulinemia)

**Definition**
- proliferation of lymphoplasmacytoid cells
  - presence of monoclonal IgM paraprotein

**Clinical Features**
- chronic disorder of elderly patients; median age 64 yr
- symptoms: weakness, fatigue, bleeding (oronasal), weight loss, recurrent infections, dyspnea, CHF (triad of anemia, hyperviscosity, plasma volume expansion), neurological symptoms, peripheral neuropathy, cerebral dysfunction
- signs: pallor, splenomegaly, hepatomegaly, lymphadenopathy, retinal lesions
- key complication to avoid: hyperviscosity syndrome
  - because IgM (unlike IgG) confined largely to intravascular space

**Investigations and Diagnosis**
- bone marrow shows plasmacytoid lymphocytes
- bone lesions usually not present
- blood work rarely see hypercalcemia
- cold hemagglutinin disease possible: Raynaud’s phenomenon, hemolytic anemia precipitated by cold weather
- normocytic anemia, rouleaux, high ESR if hyperviscosity not present

**Treatment**
- Bendamustine – R/R-CVP chemotherapy, alkylating agents (chlorambucil), nucleoside analogues (fludarabine), rituximab, or combination therapy
- corticosteroids
- plasmapheresis for hyperviscosity: acute reduction in serum IgM

Complications of Hematologic Malignancies

Hyperviscosity Syndrome

**Definition**
- refers to clinical sequelae of increased blood viscosity (when relative serum viscosity >5-6 units), resulting from increased circulating serum igs or from increased cellular blood components in hyperproliferative disorders (e.g. multiple myeloma, leukemia, PV)
- Waldenstrom’s macroglobulinemia accounts for 85% of cases
Clinical Features
• hypervolemia causing: CHF, headache, lethargy, dilutional anemia
• CNS symptoms due to decreased cerebral blood flow: headache, vertigo, ataxia, stroke
• retina shows venous engorgement and hemorrhages
• bleeding diathesis
  • due to impaired platelet function, absorption of soluble coagulation factors (e.g. nasal bleeding, oozing gums)
• ESR usually very low

Treatment
• plasmapheresis, chemotherapy

Tumour Lysis Syndrome

Definition
• group of metabolic complications that result from spontaneous or treatment-related breakdown of cancer cells
• more common in diseases with large tumour burden and high proliferative rate (high grade lymphoma, leukemia)

Clinical Features
• metabolic abnormalities
  • cells lyse, releasing K\(^+\), uric acid, PO\(_4\)\(^3-\) (increased levels)
  • PO\(_4\)\(^3-\) binds Ca\(^2+\) (decreased Ca\(^2+\))
• complications
  • lethal cardiac arrhythmia (increased K\(^+\))
  • acute renal failure (urate nephropathy, see Nephrology, NP31)

Treatment
• prevention
  • aggressive IV hydration
  • alkalization not recommended due to risk of calcium phosphate or xanthine precipitation in renal tubules
  • allopurinol or rasburicase
  • correction of pre-existing metabolic abnormalities
• dialysis

Blood Products and Transfusions

Blood Products
• RBCs, platelets and coagulation factors (frozen plasma [FP], cryoprecipitate, factor concentrates) are available for transfusion
• donated blood (1 U = 450-500 mL) is fractionated into these various components
  • centrifugation separates whole blood into RBCs and platelet-rich plasma
  • platelet-rich plasma is further fractionated into platelets and plasma
  • need to pool together multiple units to obtain therapeutic amounts
  • FP (previously known as FFP) is plasma frozen within 24 h of collection
  • cryoprecipitate is the high MW precipitate generated when FP is thawed at low temperatures

Specialized Products
• irradiated blood products
  • prevent proliferation of donor T-cells in potential or actual bone marrow transplant recipients
  • used for immunocompromised patients or for patients on purine analogue chemotherapy, first-degree relatives, HLA-matched products and intrauterine transfusions, Hodgkin lymphoma
• CMV-negative blood products
  • potential transplant recipients
  • neonates
  • AIDS patients
  • seronegative pregnant women
**Red Blood Cells**

**Packed Red Blood Cells**
- stored at 4°C
- transfuse within 42 d of collection, otherwise cell lysis may result in hyperkalemia
- infuse each unit over 2 h (max of 4 h)

**Indications for Packed RBC Transfusion**
- Hb <70 g/L; this may change as per patient’s tolerance or symptoms
- maintain Hb between 70 and 100 g/L during active bleeds
- consider maintaining a higher Hb for patients with:
  - CAD/unstable coronary syndromes
  - uncontrolled, unpredictable bleeding
  - impaired pulmonary function
  - increased O₂ consumption

**Selection of Red Cells for Transfusion**
- when anticipating an RBC transfusion, the following should be ordered:
  - group and screen: determines the blood group and Rh status of the recipient as well as the presence of autoantibodies vs. major/minor blood group antigens in the patient’s serum
  - cross-match: involves mixing the recipient’s blood with potential donor blood and looking for agglutination (takes 30–45 min)
- when blood is required, several options are available
  - 1ˢᵗ line: fully crossmatched blood, electronic crossmatch is becoming more widely used (not always available in emergency situations)
  - 2ⁿᵈ line: donor blood of the same group and Rh status as the recipient
  - 3ʳᵈ line: O- blood for females of reproductive age; O+ blood for all others

**Platelets**

**Table 37. Platelet Products**

<table>
<thead>
<tr>
<th>Product</th>
<th>Indication</th>
</tr>
</thead>
<tbody>
<tr>
<td>Random donor (pooled)</td>
<td>Thrombocytopenia with bleeding</td>
</tr>
<tr>
<td>Single donor platelets</td>
<td>Potential BMT recipients</td>
</tr>
<tr>
<td>HLA matched platelets</td>
<td>Refractory to pooled or single donor platelets, presence of HLA antibodies</td>
</tr>
</tbody>
</table>

- stored at 20–24°C
- random donor platelets are transfused from a pool of 4 units; this should increase the platelet count by ≥15 x 10⁹/L
- single donor platelets (transfused as single units) should increase the platelet count by 40–60 x 10⁹/L
- if an increase in the platelet count is not seen post-transfusion: autoantibodies (i.e. ITP), alloantibodies, consumption (bleeding, sepsis), or hypersplenism may be present

**Table 38. Indications for Platelet Transfusion**
